EXTRACT

From an Act prescribing Rules for the Government of the State Library, passed March 8th, 1861.

SECTION 11. The Librarian shall cause to be kept a register of all books issued and returned; and all books taken by the members of the Legislature, or its officers, shall be returned at the close of the session. If any person injure or fail to return any book taken from the Library, he shall forfeit and pay to the Librarian, for the benefit of the Library, three times the value thereof; and before the Controller shall issue his warrant in favor of any member or officer of the Legislature, or of this State, for his per diem, allowance, or salary, he shall be satisfied that such member or officer has returned all books taken out of the Library by him, and has settled all accounts for injuring such books or otherwise.

SEC. 15. Books may be taken from the Library by the members of the Legislature and its officers during the session of the same, and at any time by the Governor and the officers of the Executive Department of this State who are required to keep their offices at the seat of government, the Justices of the Supreme Court, the Attorney-General and the Trustees of the Library.

SAN FRANCISCO, SATURDAY, JANUARY 6, 1872.

VOLUME XXIV. Number 1.

HINTS TO MINERS.—NO. 5.

Formation of Deep Placers.

When we leave the quite recent deposits which are due to forces now in operation, where the gold can be traced to its source, either to a ledge in a hill near by, or the older gravels which the modern stream has cut into and transported, and take into consideration the character, position, extent, etc., of the auriferous deposits of earlier formations, many difficulties are met with. For the purposes of miners deep deposits are not traceable, within reasonable limits, by surface indications in the places where they occur. A small stream may be for some distance easily traced by the strata of sand, gravel, water-worn pebbles, etc., but when it is followed towards low level plains through which the modern stream has cut a channel, the strata increases in thickness and it is not always possible to mark the course of its old bed. It is hidden by layers of sand and drift, and where the distance between the ridges which form the valley is considerable it is often doubtful that when a miner stakes out his claim it will include any considerable length of the old stream bed.

Of course the probable direction of the old channel may be laid out and it is to be supposed that the deposits nearly everywhere run parallel to the modern streams, but the smaller deflections are numerous and there may be many differences from what is supposed to be the proper course. As often occurs, a bed that is rich for some distance spreads considerably, changes its character and ceases to pay. In such places it is difficult to follow the run of the rich ground and where the width is very great it is easily lost. Although the works may be abandoned and many small claims on the supposed course prove unremunerative, the lead is surely there. An interesting chapter on the action of water is observed in modern streams, occurs in Smyth's Gold Fields of Victoria which we condense for the purpose of a more easy understanding of the modes of deposition of more ancient alluvial deposits:

Whether the auriferous drifts, clays and detritus are exposed on the surface or covered by basalt, or by quite recent sedimentary deposits, they present as far as is known at present, everywhere the same features. In other words if the superincumbent strata were removed, the underlying drifts and ranges of clay-slates and mudstones would not differ in the mode of distribution or occurrence from those which are not so covered.

The action of the atmosphere or rain and wind, of the sun and dew, is to wear away and make ready for removal by streams, large or small, even the hardest rocks. A stream once formed acts in two ways; it cuts into the rocks through which it flows and at the same time deposits in the line of its course the heavier materials brought down from the neighboring hights. In this manner are the alluvia formed; and if the stream be strong and the clivity not excessive, and the rocks soft, a comparatively wide extent of drifts and clay arranged nearly in the order of their specific gravities, (having regard to the form of the particles), will be deposited; and these strata will gradually increase in thickness until the stream in its lower parts begins by reason of a fall of the ground to act energetically, scooping out for itself a deeper channel. This will in a time wear back and a new and deeper course will be cut through the alluvia and bed-rock. The result of this action is shown in Fig. 1, in which $x\,x$ is the bed-rock; $A\,A$ the older

Fig. I.

drift; B the newer drift, $c\,c$ the older drift that has been cut through and carried away.

The stream represents the gutter of a lead, and the drifts, $A\,A$, the wash from the lead. It is often supposed that this wash is necessarily younger than the drift of the gutter, but it is perhaps in some instances older. It is easy to conceive that many massive layers, all of different ages, may have been formed in this way; and where it is capable of proof that the stream has always been cutting for itself a deeper

Fig. II.

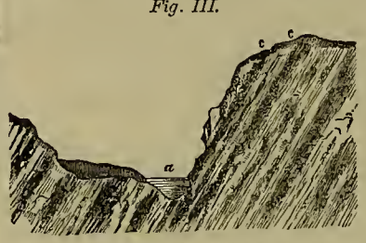
channel, we may assume of a certainty that the upper drifts are older than those lying at lower levels.

It is not often that a stream will continue to deposit materials in the direction of its course for long periods, and until its course is changed, but this sometimes happens in placers where the bounding range on either side is very low, the course will silt up, and when perhaps by some fall of rock the waters are temporarily dammed back, they will find an outlet over some part of the range into a different drainage area. Under such circumstances it is almost impossible to determine the relative ages of the deposits, more especially where the materials composing the drifts are of the same lithological character.

Streams of water, acting on highly inclined strata, composed of argillaceous rocks and soft sandstones, effect very important alterations in a short time. The stream, a, shown in Fig. 2, would rapidly wear away the rock against which it strikes, and every shower of rain would assist in eroding the mass, causing the upper part to fall down as the under part was excavated. The course would shift gradually to the right, and all the materials composing the cliff, including the intersecting veins of quartz, would be broken up and carried away, to be deposited in some part of the stream bed.

Fig. 3, in which a is the stream, shows what is effected when adverse forces cooperate. The water eroding the rocks on the right hand side, would cause masses to fall from time to time; but slips would occur also very frequently. Surface water finding its way into layers of clay, as at $c\,c$, would facilitate this operation, and an insignificant stream would soon percepti-

Fig. III.



bly alter its channel. Where claystones in such places form part of the strata, the layers will not cohere, and large masses will slide into the bed of the creek or river.

Remarkable changes follow this kind of erosion, and none is more common than that shown in Fig. 4. On examining an ordinary horseshoe bend, one sees that the stream has at different periods overflowed and denuded nearly every part of the surface of the peninsula, C, which is therefore much lower than the adjacent country. The waters having finally cut a course as indicated in the diagram, continue to erode

Fig. IV.

the sides of the range, at A and B, in the manner shown by Fig. 2 and Fig. 3, until at last the isthmus is cut through; the channel is deepened, and with the lapse of time the old course around the peninsula is almost obliterated. The detritus in it lies at a much higher level than the more recent alluvia, and when still further changes have taken place, its origin may scarcely be traceable.

The Absorption of Sulphur by Gold.

Mr. William Skey, analyst to the geological survey of New Zealand, has published an interesting paper on the absorption of sulphur by gold, and its effects in retarding amalgamation. While investigating the causes of the reported loss of gold during the process of extraction at the Thames gold fields, he observed that much of this loss could scarcely be referred to any of those causes generally supposed operative for it. He therefore tested the actual condition of the natural surfaces of numerous specimens of Thames gold, in respect to their behavior with mercury, and examined further than has hitherto been done into its comportment with several of those substances likely to be associated with it in a natural way.

The results of these examinations are minutely recorded in his paper, and the following short abstract of them is taken from the London *Chemical News*. The author finds—

1. That numerous samples of bright, clean-looking gold, of all degrees of fineness, refuse to amalgamate on any part of their natural surfaces, though taken directly from the reef and untouched by hand.

2. That on such surfaces sulphur is always present.

3. That native gold, or gold in a pure state, readily absorbs sulphur from moist sulphureted hydrogen or sulphide of ammonium, and absorbs it directly when administered in boiling water.

4. That surfaces so treated refuse to amalgamate, though no apparent change can be observed in their aspect.

5. That gold so affected is rendered amalgamable by roasting in an open fire, unless copper is present to the extent of seven per cent. (or perhaps less), while the same effect is produced by the contact of cyanide of potassium, chromic and nitric acid, and chloride of lime acidified.

6. That this absorption is altogether of a chemical nature.

7. That sulphates of iron, in presence of air and water, decomposed various metallic sulphides common to auriferous reefs, in such a manner as to liberate sulphureted hydrogen.

The action of sulphureted hydrogen upon gold, in rendering it non-amalgamable when placed in contact with mercury, was demonstrated with striking effect by the author before the members of this society.

From these results the author has been led to suppose that a large area of the natural surfaces of native gold is covered with a thin film of an auriferous sulphide, and that the greater part of the gold which escapes amalgamation at the battery is represented by that portion of this sulphurized gold which has remained unabraded during the processes of milling or extraction from the reef; the state of the gold, rather than that of the mercury, therefore, being the greatest impediment to thorough amalgamation.

In addition to these results, the author communicated others relative to the effect of solutions of sulphureted hydrogen and sulphide of ammonium upon platinum. In rendering it non-amalgamable, he believed a sulphide of the metal had formed in each case, since chromic acid rendered it again amalgamable. He also stated that this metal is also so affected by ammonia or the fixed alkalies that it will not amalgamate, except in presence of a mineral acid, from which he suspects platina is capable of superficial oxidizement when in contact with alkaline substances, even at common temperatures. The author found that his samples of gold were not affected by the alkalies in this manner, except in the case of one from Victoria, a singularity from which was argued the presence of palladium in this particular sample.

THE WEATHER.—Mr. F. B. Pilling of the Signal Service Corps, has furnished us with a table showing the monthly mean report which sums up as follows: Mean daily barometer, 30.09; thermometer 53; rainfall, inches, 0,436; prevailing wind, south-west; number of miles travelled by the wind since the 15th ult., 4,430 miles.

CORRESPONDENCE.

RESOURCES OF MONTANA.

[By Our Own Traveler.]

During a recent visit to Virginia City, the capital of Montana. I found it in a flourishing condition. The Daily *Montanian*, the official paper of the Territory, is printed by steam, and has the second steam press introduced into Montana. It contains all the late telegraphic dispatches and the current news of the day. One banking house in Virginia City received $90,000 in currency this fall, and paid the same out to miners in 90 days.

Mr. D. W. White, traveling agent for the Giant Powder Company of your city, made some experiments during my stay at this place, which resulted satisfactorily to all who witnessed them, and demonstrated its peculiar adaptibility for blasting purposes.

In November the wholesale rates of produce were as follows: Flour, XXX, $7.50 per sack; XX, $7.00; X; $6.50. Retailing from 50 cents to $1,00 higher. Wheat, 3½ cents per pound; oats, 2½ cents per pound; potatoes, 2 cents per pound; butter, 45 cents per pound; eggs, 65 cents per dozen; cabbage, 3 cents per pound; onions, 12½ cents per pound; dressed hogs, $18 per hundred pounds; chickens, $9 to $10 per dozen; hoef, 8 cents on foot.

Placer Mining in Alder Gulch

J. M. Knight & Co. have a large mining claim near the city, in this gulch, and have 4,000 feet of fluming, 22 inches wide inside, and employ 10 miners. The mining season is from April to November. They own 9,000 feet of ground up and down the gulch, which has averaged $400 per day. The gold is very fine *(oro fino)*. The gulch is 12 miles long. At the upper end I noticed very fine washed boulders. There are 12 flumes in the gulch, and each company employs about 12 men; and it is said that at the present rate it will be 12 years before the ground is worked out.

The next claim visited was that of the Cork Mining Company, situated a short distance from Knight & Co's claim. During the week, this company, with five men, extracted $1,260, or $50 dollars a day to the hand.

German Bar Fluming Company,

Owned by Sedman & McGregory, has 5,000 feet of ground, and employs seven men. This is one of the most valuable claims in the gulch, and yields, on an average, $400 a week. The banks are 22 feet deep to the bed-rock. By means of a very ingeniously constructed revolving wheel, invented by Mr. Sedman, the large rocks are caught and elevated, while the smaller ones drop through, and pass on down the gulch.

Wright, Pope & Lee have 1,000 feet of ground, and employ six men, and are taking out $50 a day to the man. John Donegan owns 5,000 feet of mining property, employs six men and has taken out upwards $4,000 this season. He has an underground water drain 200 feet long and 20 feet deep. He has also a water wheel, used for hoisting, and so constructed with a clutch, to throw it in and out of gear, that after the load of dirt is hoisted up on a platform, the water is turned off the wheel, and used for sluicing purposes.

McKee's Bar.

Mr. Daniel Emory has a claim on this bar, with a shaft 20 feet, and is drifting in gravel. The timbers used are nine by three and one-half feet, and $30 are extracted to each set of timbers.

Pine Grove Fluming Co.,

Is composed of Robert McAdams and others, who employ four men, and elevate the larger boulders to the surface by means of derricks. The fall of their flume is nine inches in twelve feet. This claim is paying handsomely.

Summit Mining District

Is situated at the head of Alder Gulch, 8 miles from Virginia City. The Keystone lode averages 2 feet in width, has 3 shafts, one 80 feet deep, one 125 and the other 170 feet deep. About $25,000 have been extracted from this lode. It has a good foot wall of limestone, and a hanging wall of granite, and bids fair to become one of the prominent ledges of the district. It is owned by E. B. Coverly & Bro. Mining picks made in San Francisco by Mr. Wright, have been introduced into this district and the miners assure me they give entire satisfaction, and they are well pleased with them. There is in this district one 15-stamp quartz mill, with two arastras and one Wheeler's pan, reducing ores from the Oro Cache and How lodes. These lodes belong to the owners of the mill, who occasionally crush custom ores from the Keystone. Oro Cache has two tunnels, one 550 feet long, running in to a depth of 200 feet from the surface; the other is three hundred feet long and strikes the ledge 500 feet from the surface. The upper tunnel has had about 200 feet of paying quartz, varying from $15 to $60 per ton. About 35 tons per week are now taken out, averaging $18 per ton.

The Keystone is being worked by Coverly Brothers, and they are taking out quartz for crushing at the How mill. The John How lode is also taking out quartz which is being crushed at the mill. This lode is opened by four shafts and a tunnel, which is 700 feet long and strikes the ledge 450 feet from the surface. It has widened from a 2-inch crevice to 7 feet, and the ore is estimated at $10 per ton. Peyton & Co. are at work on the Success lode, Aces on the Emma, and Masters on the Horn, and from appearances I judge this is a very prosperous mining camp.

Brown's Gulch

Is located a few miles from Virginia City. The True silver ledge, situated in this gulch, is the property of Mr. Poznainsky, and is now being worked by him. He has a tunnel run in on the vein about 175 feet, which shows a ledge about eight feet in width, filled with splendid silver sulphuret that will yield from $100 to $200 per ton. The bullion is worth $3 per ounce.

The Pacific True, and Black silver ledges have lately been examined by parties sent here from Salt Lake for that purpose, who expressed themselves highly pleased with their appearance. The Union Pacific Railroad mine assays $125 per ton, and ore has been sold on the dump at $65 per ton. The next district I visited was

The Meadow Creek Mining District,

Situated some 20 miles from Virginia City. The Mother Hendrix mine is located here, and is owned by F. R. Merk, Esq. It has three shafts, 60, 100 and 140 feet deep, respectively. The lode averages 20 inches in width, and contains good gold-bearing quartz, with free gold and a small quantity of sulphurets. Some 24 miners are employed. Mr. M. has invested considerable money in developing this property, which will no doubt yield him handsome returns. He has erected a 10-stamp quartz mill with a 20-foot water wheel, and has introduced Stevenson's patent mould-board amalgamating pan, which holds 5,000 pounds to a charge. Its operations have been entirely satisfactory. Mr. M. was induced to try this pan, from having seen an illustration of it in the Scientific Press. He claims that its grinding qualities are superior to those of any pan in use in the Territory. The mill has a California battery, and a bar of gold is shipped to New York every week.

Want of Reduction Works.

The great need in mining in Montana is proper reduction works, facilities for working ores, and machinery such as is used for reducing like ores in other States and Territories. The machinery necessary is Stetefeldt furnaces, stamp mills for dry crushing, and pans for amalgamation. Provide the quartz miners with works at which they can get their ore reduced, and in another year the country will present a different appearance from the present.

W. H. M.

Columbia District, U. T.

Eds. Press:—Having been a constant reader of your valuable paper for some years, and seeing so many districts represented, and the good results therefrom, I take the liberty of addressing myself to you, and if you think it worthy of publication please give it room in the columns of your paper.

Location,

Columbia is situated 35 miles southwest from East Cañon, 20 miles west from East Tintic, almost due north of West Tintic, and is that section of country that is known as West Mountain, commencing at the head of Rush Valley, and running thence to Point Look Out on the old Overland mail route.

The District was discovered last September, but the first locators were not overanxious to advertise the district till they had received titles to their mines. This having been done, winter closed in upon us and prospecting ceased for a time but work is being pushed vigorously upon six different mines, and will continue all winter.

There are at present writing 104 locations on the records.

Formation and Class of Ores.

The mineral belt as far as prospected is 2½ miles wide, and 4 or 5 in length. The country rock or formation, is porphry, quartzite, and slate. Nothing of any great importance has yet been found in the slate, but the largest and best defined ledges follow the quartzite principally.

The ledges crop out boldly and in nearly every instance, where much work has been done, argentiferous galena and grey carbonatas have been exposed; assaying from $25 to $125 silver, and lead enough for practical and profitable working—some of the ore carrying as high as 80 per cent. lead. Smelters are greatly needed for the reduction of these ores. There is wood and water convenient, and every furnace facilities requisite for cheap and profitable works. The ore in this camp is self-fluxing, and the expense of fluxing material will be dispensed with rendering smelting cheap and profitable. I have never seen a mining district possessing so many rare advantages as does Columbia.

The Washington,

On Liberal Hill, is being worked with good results. The lodge is nearly five feet in width, the foot-wall pitching to the south on an incline of 40 degrees. The mine is easily worked, being decomposed oxide of lead—soft carbonates—and intermixed with small bunches of galena assaying all the way from 48 to 75 per cent. lead, and from $30 to $86 in silver. This mine will be sunk to a depth of 100 feet in the discovery shaft this winter, which will pretty thoroughly prospect the mine.

The Gold Eagle

Mine on Liberty Hill is being worked vigorously and will commence shipping ore to Ophir City this month. The ledge is three feet wide, pitching to the west, and is well defined by two smooth walls. The ore is of carbonate and galena improving in quality and quantity as the work progresses.

Chimney Corner

Mine, situated on Montezuma Hill, is down twenty-five feet on an incline, dipping to the south, showing good ore from the surface to the bottom of incline, and a ledge two feet and a half wide, improving as it goes down. We have experienced but very little winter yet, and do not anticipate much snow. The miners are all comfortably situated in good log and rock houses, and some of them being 49ers, who manage to pass a pleasant and profitable winter, and will show up a district next spring second to none in Utah.

Miner.

Toole, Utah, Dec. 20, 1871.

Volunteer "Squibs."

Public Benefactors.—Under this head an appreciative correspondent referring to the stiff-bound monthly and quarterly editions of the Press, placed for free reading on the ferries, steamers, sleeping cars, in depots, etc., throughout this coast, writes as follows:—"It has been my good fortune to travel much in California and Oregon, and generally by public conveyance, stopping often at the traveler's home (the hotel), and no one thing has impressed itself so favorably upon my attention, as a source of pastime and pleasure, as well as having a saving influence from smoking, drinking and gambling, as good, selected, short articles of varied kinds of reading matter. Men become restless and uneasy very quick when the mind is unoccupied, and without thought or intention of doing wrong, fall into various vices to "kill time."

As diamonds are valuable from their superlative brilliancy, so your bound quarterlies become valuable from being generally the only fresh and really valuable reading matter given to the traveling public. While they ornament the tables of the steamers and hotels, their pages are ladened with descriptions of mountains of treasure, valleys of marrow, and markets filled with fruit and fattened upon the dew drops of Heaven. They make us anxious to save time and save money, and aid in spreading your valuable papers before the public. Yours is an expensive and a noble work, and a generous public will not fail to reward you well for your efforts to furnish the Pacific Coast with two such valuable journals as the Scientific and Pacific Rural Press.

E. P. H.

The twelve principal private picture galleries in New York are computed as being worth over $1,000,000.

Hybrid Animals.

It is interesting to note how facts crowd in on us of a nature so curious that a few years ago they would not have received the slightest credence, but which are now placed beyond all dispute. It is not so very long since that hybrids were considered absolutely sterile. The mule was taken as a type of all this class. Now it is pretty certain that, if not the only exception in sterility, it is nearly so, and even mules have been known to produce offspring. In other animals mules are getting a varied existence. Recently, at the Academy of Natural Sciences of Philadelphia, a bird was exhibited which was a hybrid between a Brahma hen and a Guinea fowl. It was a very unique and pretty bird, pure white, with more of the graceful in its outline than either of its parents. The *American Naturalist*, always careful of its facts, not long ago gave some authentic details of hybrids between the common house cat and the raccoon of the Southern States. All these undoubted cases prepare us for admitting the following from the *Poultry Bulletin*, as being within the bounds of probability. In this Mr. E. H. Rogers, of Tuscaloosa, Ala., sends a description of an interesting hybrid produced by mating a turkey cock to a common hen.

He writes: "I have twenty-one fowls, the result of this union. At hatching, they resembled the chickens in their form and their chirping, though somewhat larger. After feathering, they assumed the color of the turkey, and the tails, instead of being like that of the maternal parent, were square, resembling that of the turkey. The bill resembles that of a chicken and a turkey. Some of them have combs very prominent at hatching, resembling much those of the common cock, though turned a little to one side. The others have no combs at all on that part of the head where the comb grows. There is a smooth place at the upper end of which is a little projection resembling that of the turkey gobbler. They are now about three months old; they have changed hut little, and are as tall as common hens. I expect to show them in different States this year at the Fairs, and I am in hopes you will see them. I send you a feather from the wing of a three months' old fowl, that you may see its character for yourself."

The greatest interest to poultry-raisers is to know whether these hybrids can be perpetuated. We have already said that progeny from hybrids is getting to be the rule rather than the exception. It was at one time supposed that the buffalo and domestic cow produced together a sterile progeny, but this is now known not to be true.

Almost all persons who believe in the sterility of hybrids try no further after producing them; and we offer these suggestions to encourage those who have been fortunate in producing them to continue on in their experiments.—*Philadelphia Press.*

The World's Fair of 1873.

Americans should remember that Vienna is to have a world's fair in 1873. At the Paris exhibition of 1867 nearly everything sent from this country took a prize, and there is no reason why the same thing should not be repeated at Vienna in 1873. The exhibition will undoubtedly be the largest that has ever yet been seen. The park set apart for the exhibition contains four times as many square yards as has ever been similarly occupied, and the principal building alone will have a length of 4,650 feet. The committee having the matter in charge wish to have full display of the raw materials and manufactured articles of each nation, with statistical information in reference to the amount produced and the trade therein.

Special efforts will be made to have the art collections as complete as possible, and it is proposed to have a loan collection from all the German museums, similar to the celebrated one at Kensington. Another speciality will be a collection of articles used by different nations in their domestic affairs, kitchen utensils, furniture, dress, ornamental objects, in fact everything used about a house. As the Austrian nation has never had an exhibition of this character, they will undoubtedly work hard to make it a success. The opportunity ought not to be neglected by the manufacturers of this country.—*N. Y. Post.*

Cyclones.—Mr. Meldrum gives reasons for believing that the East India cyclones are produced by the meeting of the northern and southern trade winds.

MECHANICAL PROGRESS.

Steel for Locomotive Boilers.

The Railway Master Mechanic's Associaciation, at New York, recently sent ont a series of questions to the various master mechanics of the country, requesting answers. Eleven questions, in all, were sent out, the first of which was:—"Do steel boiler plates, as now manufactnred, have the proper degree of harduess, or should they be softer and more ductile?"

The answers to this query were, on the whole, unfavorable to the use of steel; the great objection being that when nsed in the form of fire-box sheets, such sheets are liable to crack. If they are to be flanged, much care must subsequently he taken in annealing them.

To the 2d question:—"Do you advise the substitution of steel plates for iron in the ontside shells of locomotive boilers?"

Very few favored the use of steel, because when it is so soft as to be suitable for such purposee it ie so little stronger than iron that the platee eannot safely be made thinner; and as eteel eosts twiee as much as iron there would be lose incurred in nsing it. Steel in tuhe sheets, however, appears to stand very well and to give good satisfaction. Steel rivets are never nsed.

The 8th query was as follows:—If maunfacturere will eupply material of the required size, would you advise making tho eylindrical part of the boiler in one piece, extending from the smoke-box to throat sheets?"

In answer to this, all the replies, with a very few exceptions were in favor of making the barrel of the hoiler of a single sheet, provided sound material of the neeessary size conld be furnished.

9th. "Have you used eteel flues; if so do you prefer them to copper or iron." No one appears to approve of the use of eteel hoiler tuhee. They are condemned for the reason that they will not eaulk as well as iron.

The above are the chief points of interest sought for. Thirty-three answers were received from the master mechanics of as many of the principal railroads of the country.

MINERAL COTTON.—At the last meeting of the Franklin Institute, says the *Journal of the Franklin Institute*, Mr. Coleman Sellers exhihited a sample of a material which is now for the first time to be mannfactured and applied to useful purposes in the arts.

The produet possesses a general resemblance to cotton, for which it may doubtless in certain eases be eubstituted with advantage, but on eloser examination seeme more like epun glass, which in reality it is. It is formed by allowing a jet of steam to escape through a etream of liquid elag, by which it is blown into the finest threads, sometimes two or three feet in length. These threads, though somewhat elastic, readily break up into much smaller ones, and, the color of the suhstanco being white, the appearance of a compacted mass of it makes the name under which it has been deecribed a very appropriate one. The admirable non-conducting property of the material for heat, as well as that of the great quantity of air which it retains in its interetices, would eeem to fit it very well for a non-conducting casing to eteamboilers and pipes, an application for which it is at present being tested.

ANTIFICIAL SAUSAGE SKINS.—During the recent war in Europe, so great was the demand for sausage ekins that reoourse was had to a snbstitute. The Berlin pea eausage factory for somc time coneumed daily a hundred thousand skins; hut soon the supply hegan to run short; parchment paper was suggested as a substitute. The difficulty in the use of this material was to paste the edges of the paper containing the eausage together, ordinary paste being uselese for this purpose. Dr. E. Jacobeen, however, prepared a paste which kept the edgee firmly united after several hours boiling, and of which 5,000 pounds were used for pasting sausages.

Sevoral layers of parchment paper united with this paste closely reeemble parchment in appearance and strength, and the material thus produced would be very valuable for many purposes, such as bookbinding and the like. Parchment paper may be firmly pasted to linen cloth with the eame paste, and the article thus prodneed is a water-tight paper-linen, very well adapted for packing purposes. The eomposition of the paste is unfortunately not disclosed,—*Manufacturer and Builder.*

Mechanical Puddling a Success.

The Iron and Steel Institute of Great Britaiu recently dispatched a special commission to this country to report upon Danks' puddling machine, which has for some time been in successful operation in the iron districts of Pennsylvania. The commission were so well pleased with the working of the machinery that they sent the following cable tolegram: "Danks' furnace successful. Construct furnaces for 10 ewt., squeeze or hammer single ball. Economy and quality satisfactory." This announcement will he received with considerable interest by the iron masters in this country.

The inventor of this deviee, in a paper recently read before the Iron and Steel Institute, claimed for it the following advantages: A great saving in the cost of labor, and also in the consumption of eoal, varying according to the size of the furnace; a superior and more regular quality of puddled iron from a given quality of pig; a yield of puddled iron much in excess of the charge of pig metal, instead of the usual loss, the extra yield heing ohtained by the reduetion of the rieh fettling used in tho machine; eight to ten heats, whether of from 5 to 10 ewt., are made in a day of ten hours wheu suitable metal is used; the refining process is very complete, the whole of the phosphorus and silica, and the sulphur to a large extent, being removed by the ehemical action of the lining mixture; the very heavy and exhaustive labor of puddling ie performed hy eteam power, therehy enabling one skilled man to attend to the working of a large quantity of iron; the hringing to nature and halling of the iron is eompleted hy the rotary action without the use of rabbling, except when the heat has to he divided into smaller balls; and the capaeity may he euited for heats of any weight from 5 ewt. upwards. The cost of the furnace, weight of product considered, is about the eame as that of the usual hand-puddling furnaces. We understand that Mr. Danks will charge as royalty 50 eents per ton.

A DOMESTIC STEAM ENGINE.—It is gratifying to observe that a more than usual amount of inventive talent is being directed to facilitating household and other light work about the shop and farm. We notice in this direction that a small domestic steam motor, has recently heen brought out hy a distinguished mechanical engineer of Paris. These motore are constructed to vary in capaeity from one to four-fifteenths of a horse-power. It is intended to drive a sewing machine, churn, lathe, small eaw, pump, ventilator, and in fact any and all machines now driven by hand or foot power. The engine is heated hy a gas jet, the hoiler beiug vertieal and of peculiar and most perfect construction for utilizing the largest amount of heat. It can he set anywhere in a room, where it can he connected with a gas-hurner. The boiler is large, so as not to require heing fed oftener than once in four hours, even when in constant use, and still holds only four gallons.

By a peculiar arrangement the speed of the machine ie made to enlarge or contract the volume of the flame, and thereby regulate the production of steam to the amouut of work done. When tho machine ie at rest, the flame ie so reduced as to merely koep the eteam at a low pressure. The same device also aets as a safety valve. Explosion would he next to impossiblo. The engine and boiler weigh only 200 pounds, is 33 inches high, and costs in Paris hut $100.

AN IMPROVED LAMP.—We notice tho following recent lamp patent which muet be a great assistanee in the awkward duty of lamp filling: The improvement embraces a guido arranged in the body of the lamp adjacent to the filling-hole, and adapted to guide a float within the lamp. Also, a bright cap on the float, so mounted in the lamp as to be conspicuously seen in looking down into the filling-hole, and to warn when the filling is nearly completed. Also, a perforated cylinder in tho hollow stock or shaft of the lamp, so arranged as to receive air freely below, and to discharge it gently into the space around, to be thence conducted upward through an annular space to the burner.

CUTTING THREADS BY PRESSURE.—Of late threads have been raised by forging instead of cutting. The red hot end of the holts is placed hetween dies, with a female screw thread cnt into them. The upper die bcing pressed down on the iron, the threads are instantly formed, and are much tougher than the old one.

SCIENTIFIC PROGRESS.

Encke's Comet.

This comet, a very insignificant object in itself, has elicited much interest among astronomers from the short duration of its orhit, its near approach to the suu—nearer than Mercury—and the apparent uniform retardation of its period. We made somewhat lengthy mention, last week, of its connectiou with the theory of a resisting medium in space, and hut lately alluded to the telegraphic report that Dr. Huggins, the English astronomer, had succeeded in obtaining the spectrum of the comet. A few days since we received an advance sheet from the forthcoming January number of the Bostou *Journal of Chemistry*, from which we learu that Professor Young, of Dartmouth College, had also obtained a spectrum which he has figured in the proof-sheet hefore us, and which we have here reproduced.

The comet itself as seen through a teleseope, is a rounded mass of nebulous matter, ahout 5′ in diameter, with no definite outline, and without any distinct nucleus. It ie considerably brighter in the center; but so extremely attenuated that a star even of the ninth magnitude may be seen through it, almost as distinetly ae when no obstruction ie intervened.

The spectrum, the bands of which, three in numher, herewith shown, are apparently identical with those in the epectrum of the vapor of earhon. The middle hand, near "*b*," it will he noticed is much brighter than the other two, and is the most positive of the three. It appears that Prof. Young was more successful than Huggins in fixing the position of the two outside bands.

The speetroseope, to say nothing of observation, indieates that the material of the comet is gaseous, and gaseous only; for

there is no trace of any continuous spectrnm such as must result from the presence of eolid or liquid dust, in a state of however fine division. Prof. Young obtained his epectrum observations on the 1st, 2d and 5th of Decemher. The observations of Dr. Huggine were made at intervals from the 8th to the 17th of Novemher. The Doctor says he could not discover with certainty any trace of polarization, and asserts that incontestahly there is no polarized light in that of the comet itself.

We were under the impression that this was the first spectrum obtained of a comet; but we are now reminded that Huggins ohtained one of Comet II, 1868, which corresponds exactly with the one here shown of Encke's comet.

Dr. Huggins calls attention to the fact that the longer axis of the comet was directed almost exactly towards the eun, and that its head and nucleus were turned away from that luminary. This, he remarked, appears to be the rule with nearly all the smaller class of comets. They carry their tails before them, and not until their smaller fanshaped appendages have heen well warmed by the eun's rays, do they hegin to ehoot out large tails in the other direction.

It ie an interesting fact that the eometary matter appears to be thue directed *towards* the sun, and that it has not as yet fulfilled, in appearance at least, any of the conditions requisite for tho maintenance of the theory that comets draw their sustaining matter from the eun.

Tho aspect of the eomet, accordiug to a drawing made hy Mr. Carpenter of Greenwich, was that of "a somewhat shuttlecock-shaped nehulous haze, with two wings of much fainter light, extending on either side, giving a flattened appearance to the head of the comet." A drawing made hy Dr. Huggins agreed quite closely with the above. He thought that he had detected a minute but distinctly marked nucleus in the head of the "shnttlecock."

ELECTRICITY AS A DENTAL AGENT.—The use of electricity as an agent in aid of dental snrgery is a novel scientific applieation. Dr. Bonwill exhibited, at a late meeting of the Franklin Institute, an electro-magnet, which was conetructed to drive a plugging tool for filling teeth. By its agency the work of dentistry is said to be greatly leesened, and the time of an operation considerably shortened.

DEPOSITING ALUMINUM ON METALS.—J. Baynes Thompson, of White Hall, Eng., writes to the editor of the *Chemical News* that for more than two years he has heen depositing alnminnm daily on iron, steel, and other metals, and driving it into their surfaces at a heat of about 500° Fahr., in the same way as he does silver and nickel. He also says that he can do the same thing with aluminum bronze, of variest tints from the palest lemou to the richest gold color. Some years ago, Dore of Birmingham, England, also claimed to be able to coat eopper, brass, and German silver with alnminum by means of electrolysis. As there is no reason to douht the veracity of these gentlemen, it would appear to be a fact that aluminum ean be deposited hy electro-galvanic action the same as nickel, copper, and other metals. We should be glad to be furnished with the details of the process.

GOLD IN THE EOZOIC OF WISCONSIN.—Prof. Roland D. Irving, of the University of Wisconsin, reports the discovery of gold in the Eozoic of Wisconsin. He has fonnd small quantities in the quartz veins of Clark county, a few miles to the northward of the junction of the Potsdam Sandstone with the great etretch of Eozoic rocks, which underlie the northern half of the State. The prevailing rocks in this section, are chloritic and talcose schists, interseeted hy numerous veins of quartz. Associated with the gold were small quantities of magnetic iron in ecalee, pyrite and mispickel, as neual, scattered through a harren lookiug, tough white quartz, presenting none of the reddish or rotten appearanee eommon to eurface gold ores of any value. He ohtained, by assay, a yield of 20 cents per 2,000 lhs.

NEW PRODUCTS FROM THE OXIDATION OF CARBON.—A most important investigation from Prof. Schultze hae just been announced, upon the produets obtained in the direct oxidation of carbon with permanganic acid in alkaline solution. Besides oxalic and other acide, which were thus obtained in considerable quantity, the savant just named has succeeded in ohtaining one which he called provisionally "anthraconic" acid, but which he at the time suepected, and suhsequently, with the aid of Dr. Carstanjen and Baeyer, proved to be identieal with mellithic acid. The importance of this splendid discovery to theoretical science will be duly appreciated by the laborers in the field of organic ehemistry, and at the meeting of the scientific association at which it was announced, it was received with enthusiaem; while as the pioneer research in a field now opened for fnture fruitful discovery, its value to applied chemistry ean hardly be over-estimated.

The mellithie acid was obtained from various forms of earhon (amongst which was the graphite), and yielded, on distillation with soda-lime, benzol, and this, npon nitration and suheequent reduction gave analine.

PENDULUM EXPERIMENTS.—A series of careful experiments for determining the gravity of the Earth are about to he made at the Mont Cenis Tunnel. They will he made first in a lateral chamber ahout the centre of the tunnel, and will be afterwards repeated at the corresponding vertical point on the mountain, the difference of level being about 1,600 metres. In addition to these ohservations they propose to determine the earth'e magnetism and the temperature of the strata to which they can ohtain aceess. By preliminary oheervatione they have ascertained that the movement of the traine will not to any serioue extent interfere with the precision of the observations. The different points of observation will be connected with telegraph wires for the purpose of chronographic regietration.

ELECTRIOAL INDUCTION.—P. Blaserma, having experimented upon the velocity of electrical indnction, estimated the rate of propagation in air at 550 metres, and in gum lac at not more than 330 metres per second. The latter velocity is about equivalent to that of sound in air. Dr. Helmnotz, euspecting that the results were affected by indnction within the apparatue employed, has recently reported some experiments which demonstrate a velocity of more than 195 milee per second, or more than 600 times as great as Blaserma's esti mate.

MINING SUMMARY.

THE following information is condensed mostly from journals published in the interior, in close proximity to the mines mentioned.

California.

ALPINE COUNTY.

GLOBE.—Monitor *Miner*, Dec. 23: This week the shaft has been re-timbersd the balancs of the way down to the old level and 5 ft. more in depth made. The black ore increases and indications are very flattering.

CALAVERAS COUNTY.

NUGGET.—Calaveras *Chronicle*, Dec. 23: We havo heen shown a nugget of pure gold weighing $85, found in the Jesus Maria creek.

DRIVEN OUT BY WATER.—The props. of the Corral Flat mine have been compelled to abandou it for the pressnt on accouut of the quantity of water.

GWIN MINE.—No rock is being taken out at present, it beiug found necessary to hail constantly to prevent the mine from filling.

INYO COUNTY.

ECLIPSE MILL AND MINE.—Inyo *Independent*, Dec. 16: The Co. is just beginning to get the new mill and things connected with the mine generally, in working order.

The mine presents the most encouraging aspect. For months past an immense hody of ore, gold and argentiferous galena has been uncovered in amount without further developments to insure an abundant supply for an indefinite numher of years. The tramroad is completed to a point within 2,500 yards of the lower dump. A large force are engaged and in a few days will have it finished, so that the teams now employed iu carrying the ore from the dump to the cars can he dispensed with, thereby effecting a saving of $1.75 on the transportation of each ton of ore, besides the extra handling. Measures are in course of execution to procure a light locomotive for use on the tramroad, which was constructed with that object in view. Fourteen cars and 4 horses are now engaged in transporting the ore, at the rate of 48 tons per day. The amount does not equal the capacity of the mill, so that it will have to be shut down occasionally for want of ore. Thirty stamps of the usual style are sst up and running, and 20 more to be in place. In addition to many other contsmplated improvements the long mill race is to be lined with growing willows to protect its banks and thereby increase its capacity. The steam hoisting works will, during next week, be put in place at the mine, and then as soon as the dump and tramroad connections are completed there will he no troubls in delivering ore enough to keep 100 stamps constantly in motion. Fifty additional stamps will be put in the mill as soon as the arrangements for delivering a sufficient quantity of ore are completed. A smeltiug furnace is in course of erection, and will soon be in runniug order.

NEVADA COUNTY.

TOWN TALK MINE.—Grass Valley *Union*, Dec. 24: The Town Talk gravel mine, working about a mile east from Grass Valley, had a clean up yesterday. A two weeks run gave $2,000 worth of gold dust.

NORTH BLOOMFIELD MINE.—The claims of the Co. are in the northern part of Nevada county. They own a gravel hed on the Bloomfield Ridge, known to he rich, and it only awaits development to he profitable. A tunnel about a mile long is to be run, and has heen commenced.

YOU BET.—National *Gazette*, Dec. 28: Mr. Stone the Supt. of the English Co.'s claima at You Bet informa us, that the late rains have filled all the ditches, and that they have 3 sets of claims running under full head.

BALTIC MINE.—Grass Valley *Republican*, Dec. 28: The owners have made arrangements to commence work immediately.

BLUE TENT.—The Sailor Flat Co., at Blue Tent, have heen at work hydraulicing in their claims for over a week. They use 450 inchea of water. The Enterprise Co., started up yesterday and used 400 inches. The Killam Co. E. Bond, Supt. will commence operations on their claims to-day. They will use 750 inches of water and employ about 15 men.

LITTLE YORK.—Goodspeed & Carney, at Hunta Hill, are running their 8 stamp quartz mill night and day, crushing about 50 tons of cement each 24 hours. They run their mill by water power, and employ 19 men in their mill and mine. Their cement paya well and with great evenness. A. G. Turner, in the Eastern cement claims, at Hunt's Hill, is also doing well. He is running his 8 stamp water mill in the daytime, and is making arraugements to crush night and day, when he will employ from 18 to 20 men. W. Duryea, at Buckeye Hill, is working 4 sets of hydraulic claims, and averages 3 pipes to each claim. At Quaker Hill, Jacobs & Sargent are running 6 ssts of hydraulic claims and altogetber 2,500 inches of water, and employ 30 men. At Little York, the English Co. that purchased ditch property and mining ground of E. Williams, last summer have an ahuudance of watsr, and are working their miue on an extensive scale. The season in Little York township opens favorahly, and the gold yield promises to he larger than it has heen since 1862.

LENGE OF ANTIMONY.— A ledge of what is supposed to bs sulphurets of antimony has heen discovered about 10 miles from Grass Valley. The ledge is ahout 3 ft. wide, in a hard syenite rock. An assay of some of the best looking pieces of rock yielded 75 per cent. of pure antimony. It also showed silver at the rate of $30 ton, and gold at $18 a ton. Steps will he taken to develop the mine immediately, and ascertain its value.

Nevada.

COPE DISTRICT.

LUCIN.—Elko *Independent*, Dec. 23d: The smelting works of Buel & Co. started up again on Monday, and were turning out at last accounts a tou of bullion every 2 hours.

EUREKA DISTRICT.

PHŒNIX RUN.—Eureka *Sentinel*, Dec. 29th: The Phœnix Smelting works commenced producing hullion at one o'clock A. M. Dcc. 21st; and at 2 o'clook P. M. about 20 tons had been run into bars.

UNCLE SAM.—A rich strike was made in the Uucle Sam mine Dec. 25d. The ore is represented as a very high order of gray carhonate, and the indications are that the ledge will develop into unusual size aud permanency.

STEAM UP.—The Cons. got up steam yesterday to dry the furnaces. The works will resume operation in earnest on or about the 5th of Jan.

NEW MILL.—In the southern part of town J. P. Jones & Co. have in process of erection a 5-stamp mill. The building is 25 by 40 ft., and in the main building thsre is a carpenter shop, assay office, with assay furnace attached, and in the rear the mill machinery is heing put up. It is intended to have 5 stamps, 3 pans, aud one large settler, driven by a small engine.

PINTO M. Co.—Located in Pinto Dist., on the survey known as the Dutchman's Ranch, ahout 7 miles from Eureka, is the mill of this Co. It contains 20 stamps, with a Stetefeldt furnace of the latest improved pattern, aud is capable of crushing and roasting 30 tons of ors per day. There are now 200 tons of ore on the dumps of the various mines of the Co., and the mill is well supplied with a sufficiency for running purposes. Work is steadily progressing, aud new and richer bodies of ore have been developed. The famous Basye property, adjoining the well known Geddes & Bertrand series; has lately passed into the hands of this Co., and the supply of ores will be ample for an indefinite length of time.

ELY DISTRICT.

BULLION.—Pioche *Record*, Dec. 24: W. F. & Co. shipped since Dec. 17th, for Meadow Valley Co. 19 bars consigned to New York, valued at $21,875.23; 11 bars from Raymond & Ely, consigned to N. Y., valued at $32,979.52; 7 bars from Meadow Valley M. Co., to N. Y., valued at $7,853.21.

NEWTON BOOTH.—This claim is on Panaca Flat, some 400 ft. northwest of the Panaca shaft. The upper portion of a ledge was run through at ahout 110 ft. deep. The shaft is down about 130 ft. A ledge the full size of the shaft has been struck. The ore shows chlorides of silver and some galena.

RAYMOND & ELY.—Owing to the burning of a hoiler sheet and the wearing out of some of the pans at the 20-stamp mill, the receipts of the Co. have fallen off; the last shipment being $33,000 (only $5,500 a day). The mill was stopped for 48 hours, on Monday, but has started up again. The mine is improving daily, the lower level showing over 240 ft. of ore in length, of good quality. The new 30-atamp mill will be atarted before the 15th of Jan.

PROSPECTING CLAIMS.—The Excelsior West Ext. of the Alps, Pacific Tunnel, No. 4, Caroline, Pioche, Champion, Silver Chief, Chief of the Hill, Gen. Moltke, Ivanhoe, Chapman and other claims are being atesdily worked. Some of the claims show good ore and justify further developments.

NEW STRIKE.—The Newark, on the Black Ledge. about 350 ft. east of the Lightner shaft, have struck fine ore at the depth of 125 ft.

GOOD SHOWING.—Recent assays from the ledge struck in the Newton Booth. show remarkably well for the futurc of the claim. Out of half a dozen samples taken from different portions of the ledge, the highest assay was $574.93, and the general average of the lot was $262.

THE Alps is hoisting the usual amount of ore per day. The character of ths ore in the east drift is improving rapidly. The galena has nearly disappeared at the depth where work is being carried on, rich chloride and horn silver, having taken the place of the hase metals.

PEAVINE MINE.—This claim is on the Peavine Mt. commmencing 1,500 ft. west of the Bowery mine and contained 1,000 ft. of mining ground. The ledge is traceable on the surface the entire claim. Three hundred ft. west of the east end of the claim a shaft has been sunk, following the ledge 50 ft. deep. At the 30-ft. level a drift was run west 18 ft., showing one foot of ore in the face of the drift. Throughout the entire works the ledge is well defined. The foot-wall is solid and has a fine selvage, showing it to be a true fissure vein. Forty tons of ore on the dump are as beautiful in appearance as it is in chlorides of silver, and contains some magnificent specimens of antimonial silver. The top rock is mostly argentiferous galena, and gives place to quartz containing large quantities of chlorides of silver. The average assays of the ore show it to contain $160 psr ton.

HUMBOLDT.

BULLION —Unionville *Silver State*, Dec. 30: Amount shipped from the Arizona mine, since our last issue, was $7,767.

DUN GLEN.—Sprague& Co.'s new quartz mill started up on ore from the Lang Syne mine, on Tuesday and is a decided success.

REESE RIVER.

GOOD YIELD.—Reese River *Reveille*, Dec. 27: Groves aud hrother have had another crushing from their mine. There were 3 lots. The first class ore (1½ tons) worked up to $903.54 per ton. The second class, cousisting of 11¼ tons, returned $215.58 per ton and the third class 9 tons—gave $62.44 per ton.

MOREY ORE.—Two lots of ore from Mr. Ogden's mine, Morey dist., have been worked at the Manhattan mill. One lot, of 3¾ tons, returned $369.00 per ton. The other worked lot, 2¼ tons, yielded $382.90 per ton.

SUMMIT CANON.—A lot of ore from G. Hall's mine at Summit Canñon amounting to 13¼ tons, recsntly worked at the Manhattan Mill, returned $160 20 per ton.

BELMONT ORE. —The Manhattan Co. have worked 11 tons of ore from the Arizona mine, at Belmont. It yielded $279 50 per ton.

THE Manhattan mill Co. run through 15 tons from their mine, the Oregon, this week.

One and a half tons returned $1,375 47 per ton, and 13½ ton yielded $436 65 psr ton.

LONE STAR.—This property is being worked by its owner, aud is turning out a large qnantity of splendid ore. For several months, a constant stream of splendid rock has been coming out of the mine and it still looks as good as ever.

MONITOR. The property of the Co. consists of hetween 1,500 and 1,600 ft., comprising the Monitor and Independencs locations. A tunnel taps the ledge at a distance of 250 ft. from the surface showing a well defined ledge from 3 to 15 ft. in width with well defined walls on either side. The ledge has been prospected a distance of 400 ft. in length hy drifts and winzes and to the depth of 50 ft. helow the tunnel, exposing a well defined ledge the entire distance, averaging in thickness as ahove stated; nearly all the rock being good milling ore, assaying from $50 to as high as $4,000 per ton.

One hundred and sixty tons of ore worked at the Manhattan mill within the the last 4 moutha yielded over $71,000, an average of $444,44 per ton.

WASHOE.

BULLION.—Virgiuia *Enterprise*, Dec. 29: A lot of 8 hars of hullion, worth $190,000, was yesterday shipped. For the past two days the shipments have been 162 bars, worth $365,000.

SHIPMENT FOR THE MONTH ANN THE YEAR. The bullion shipment for the month of Dec. from Wells, Fargo & Co.'s was 522 bars, 39,808 ℔s. valued at $981,188.96. The total bullion shipmeut for 1871 was 6,612 bars, 195,000 ℔s. (97¼ tons), and worth $10,921,412.06. The shipments from the Gold Hill office of Wella, Fargo & Co. are not included in the above; including the hullion sent from Gold Hill the total is $12,500,000. The shipment from this place for this year exceeds that of 1866 by $3,400,000,

SHUT DOWN.—The Kentuck mine is shut down for the present. There is no getting ore to the mills and no getting it crushed once it has reached there.

OPHIR SHAFT.—The new Ophir shaft was yesterday down 1,246 ft., leaving 54 ft. to go hefore starting the maiu drift for the lead. Before this drift is started a sump will he constructed and the pump put in place ready for action in case a largc deposit of water shall be struck in the drift.

SUTRO TUNNEL.—The Sutro Tunnel Co. have attacked their grsat adit at all points, with everywhere a strong force of workmcn. The main tunnel is in 2,550 ft., and is again in pretty hard rock. Shaft No. 1 is down 12 ft.. iu ground that works well; Shaft No. 2 is down 30 ft., in a species of conglomerate (trachyte); Shaft No. 3 is down 20 ft., ground all hard, blasting rock, No. 4 is down 18 ft.; ground hard. They are going ahead in good earnest with their work. Once they get the 4 shafts down to the tunnel level, they will be able to work in the tunnel itself at 9 different points.

CALEDONIA SHAFT.—The new Caledonia shaft is down 460 ft. The rock continues of a favorable character.

ITEMS.—Gold Hill *News*, Dec. 30: The Belcher still continues showing better and better as further developed. At the 1,100-ft. level the south drift is in 284 ft., the face showing good ore, assaying $100 per ton on the average. The southeast crosscut from it is in 30 ft., and the face shows a mixture of quartz and porphyry. The south winze is down 11 ft., with good ore at the bottom. The winze 80 ft. south of the north line is up 112 ft., and the face of it shows good ore. The north winze is down 80 ft., with its bottom in good ore. On the first floor the vein is stoped out 155 ft. south from the north line, and the breasts are still in good ore. The second, third, fourth and fifth floors are all looking finely. Good ore in all directions. At ths 900-ft. level the east cross-cut from the south drift is in 67 ft., and its face still shows good ore. Last week 700 tons of ore were taken from the Hale and Norcross mins, and 1,000 tons from the Savage mine, the latter assaying $27.20 per ton. The dump of both mines are full, therefore but little ore is being taken out. There is some talk of the Savage suspending operations for a while until ore can be again transported to the mills. There is plenty of good ore developed in the mine, but it is not expedient to take it out at present.

WHITE PINE.

BULLION.—White Pine *News*, Dec. 23: W. F. & Co. shipped to-day to London, for Eberhardt & Aurora M. Co., (limited) 7 bars of bullion.

SINCE last report, the Eberhardt & Aurora Co.'s mines have improved. In the South drift, running from the Lady's chamber, an immense hody of ore is in sight, and the size of the ore-body increases daily. A strike was made in the Iceberg—ore of the South Aurora Co.'s mines—of a highsr grade of ore than usually taken out. Work in the Original Hidden Treasure and South Aurora tunncls is steadily going ahead, to cut the mineral below ths workings.

NORTH AURORA.—The usual force of men are employed in the Risdale chamber breaking down ore and hoisting to the surface, for shipment hy tramway. There is already a large amount of ore on the dumps from the Risdale chamher. In the Lady's chamber the amount of ore in aight is immense. The south drift from the Lady's chamher shows the finest hody of ore ever developed in the State. There is a qnarter of a million of dollars in sight in the Lady's chamher and south drift aince the mine was last reported on; and there is no limit to the ore-body as yet—or, in other words, there is no wall either east or weat. It is expected that the Ward Beecher will connect with the Lady'a chamher in a few daya.

EMERHARDT.—The ore in the Keystone shaft has improved since last week in the grade and quantity. Work will uot be resumed in the open cut until the weather is favorable. Working the usual force of men.

EAST SHEBOYGAN.—Since last mentioned, connections have heen made from the different workings, and a force of men commenced atoping out in the original tunnel. The ore taken out during the winter will be piled on the dumps to he worked by the Company's mill, which is proposed to be erected in the spring.

SOUTH EX. OF HIDDEN TREASURE.—The drift running North from the Anchor incline is progressing rapidly, and the indi-

cations are favorable. The appearance in the main shaft (situated on the North end of the ground) is better than reported last week.

ICEBERG.—A strike of rich ore was made in the mine the past week. Heretofore the grade of the ore has been of a fair milling quality, but the great improvement in the quality of the ore since we last visited the mine astonishes us.

GREAT WESTERN.—Work is suspended for the winter. Since fall the amount of shaft work done is 150 ft. and the levels run will foot up 67 ft. There is a large body of ledge matter in sight, but the average assay will not go over $10 per ton. Operations will commence early in the spring, and we are of the opinion that a good body of ore will be opened out.

SLOW DROP SHAFT.—Fair headway is made sinking, and no change to report in the appearance of the rock. The foreman of the works is sanguine of opening out a large body of ore after the shaft is down to the proper depth.

NOONDAY.—The ore in the breast grades the same as to quality as reported last. The thickness of the ore-body has increased. The amount of ore hoisted daily is about three tons. The usual force of men at work.

WARD BEECHER.—The shaft in the east end of the mine is going down in ore of average milling grade. The object in view is to connect with the drift running east from the Lady's chamber.

ENGAN.—The parties working the mine are taking out ore that will mill better than the last lot crushed, and feel satisfied of opening out a still higher grade of ore in a few days.

SILVER WAVE.—Work progresses in the Lyford, Perkins, Chamberlain and No. 4 shafts as usual. The contractors are making good headway.

SOUTH AURORA.—Tunneling and shafting goes ahead as usual. The contractors are making good headway.

GEN LEE.—The Supt. informs us that work will be resumed in a few weeks by contract.

OUTSIDE DISTRICTS.—PIERMONT.—The mill shut down for repairs, but will start up again in a few days. Since we last made a note of the Piermont Co.'s mines the ore has improved in grade, and the ledge has increased in width. The ore-body is between 7 and 8 ft. wide, and there is a breast opened 150 ft. long. The whole underground force will be at work stoping out when the mill starts up.

SCHELL CREEK MINES.—The mill of the Ruby M. & M. Co. will start up on ore from the Cow & Calf, one of the best mines in the Schell Creek Range, and afterward will commence on ore from the Silver Bluff, lately leased by the Co. As far as heard from, the mines throughout the range are looking well. The McMahon shows the usual fine body of ore, and is represented to be second to no mine in the Dist.

SAN JUAN DEL RIO.—Work was suspended for a few days, on account of the stormy weather, but operations commenced again this week, and a seam of rich chloride ore was developed. The general appearance of the mine has improved since last reported. The Supt. informs us that he will commence shipping to mill immediately after the holidays.

PIOCHE.—The Panaca mine, belonging to the Raymond & Ely Co., is showing an extensive body of ore. The Pioché, Alps and American Flag mines come up to the expectations of the managers.

MILLS.—INTERNATIONAL.—Running on Company rock.

MANHATTAN.—Running on tailings; will shut down for repairs in a few days.

STANDFORD.—Running on tailings.

BIG SMOKY.—Running on Hidden Treasure custom rock.

SWANSEA.—Running on East Sheboyan ore.

British Columbia.

CARIBOO.—British *Colonist*, Dec. 21: On Williams Creek mining operations have been retarded by the severe weather, on account of which work has been suspended in the principal claims. The Ballarat has commenced washing underground, and the Cariboo Co. are preparing to do likewise. On French Creek the Ambrose Co. has found good prospects on the high rock. The Black Bull Co. are engaged in getting their steam engine to the claim. On Jack of Clubs Creek, the Two Sisters Co. had got into the channel and obtained excellent prospects. The First Chance Co., on the same creek continue to get average pay.

During Nov. gold to the value of $75,-415 was assayed at the Government Assay Office.

OMINECA.—The Gold Commissioner's report, dated Oct. 23d, says: "It is difficult to ascertain the amount of gold taken from the Omineca mines during the present season, but the returns that have been furnished to me by the foreman of the principal Co. show a yield of $300,000, and to this may be added not less than $100,000 more, taken away in the hands of which there is no return, making in all $400,000."

PAINE CLAIM.—*Standard*, Dec. 20: The Paine claim on Germanson creek produced to 3 hands this season $19,000 gold dust, and there was but little expense connected therewith. Besides this, specimens of nearly pure silver, copper and platinum have been taken out of this claim.

Idaho.

SHIPPED.—Owyhee *Avalanche*, Dec. 23: W. F. & Co. shipped from here yesterday 4 bars of bullion, valued at $8,069.50.

Nick Zapp and others have located 3,000 ft. square of placer mining ground between the Oro Fino mine and Cape Horn. Good prospects have been obtained and it is thought that the ground will pay well.

MINING RECORN.—The North Discovery of the Oro Fino is yielding a large amount of ore. It is reported that a very rich strike has just been made in that mine.

The South Oro Fino, is yielding from 25 to 30 tons of ore per day, which is being crushed at the Elmore mill. This mine is so well opened that about a ton of ore to the man is being daily taken out, at a cost to exceed $5 per ton. There are about 400 tons ahead of the mill.

During the past week a rich strike has been made in the 11th level of the Elmore 130 ft. north of the slip in the mine. Fifty or sixty dollar ore with a 2 ft. voin.

The Golden Chariot is yielding fine looking ore from both the 5th and 8th levels. Additional hands have been put to work.

The Minnesota is looking splendidly. The last contract for 100 ft. of shaft is completed which makes it 230 ft. deep. And now, 3 drifts are let to run from the main shaft—one north and two south: As soon as these drifts are in far enough; stoping will commence. There are already out at the mine over 100 tons of ore that will yield at least $40 or 50 per ton, and will be milled about the last of this month.

The Mahogany shaft is going down for the 5th level. About the first of next month the shaft will be down far enough to be out of the way of cutting the ledge at the 4th level, which will then be done.

The South Chariot is yielding fine ore from the 4th level lately struck by Pete Nick, who is running the drift. It is $35 or $40 ore, with a large ledge. The ore from the drift will he crushed during the coming week.

The War Eagle continues to yield a fine quality of ore.

GOLD SHIPMENT.—Idaho *World*, Dec. 21: During Nov. the bank of DuRoll & Co., shipped below, gold bars of the aggregate value of $100,892.17.

Montana.

QUARTZ.—Helena *Herald*, Dec. 21: Work on the gold quartz ledge "Red Bluff," below Sterling, in the Hot Springs Dist. is being vigorously prosecuted by J. Lounds who is obtaining good results. The ore, which is of a superior quality, is being worked in aarstras. The quartz yield is said to abundant, and the profit quite satisfactory.

SILVER STAR.—Deer Lodge *Independent*, Dec. 23: Porter, Harper & Ellis have bought the Iron Rod lode and mill, and intend starting it up immediately. The Green Campbell mill is shut down for the present, the Co. being engaged in putting a shaft in the mine for the purpose of erecting hoisting works. Tripp & Ainsly's mill is frozen up. Porter & Meagher's new mill has made one run from the Nugget lode, which proved successful. Quartz interests generally are looking well in Silver Star and Iron Rod dists.

PANNING OUT.—Helena *Gazette*, Dec. 25: The Pittsburg mill has been crushing on the Jaw Bone lode, in the vicinity of St. Louis with good success producing $1,200 from 50 tons of rock.

Utah.

BULLION.—S. L. *Tribune*, Dec. 27: W. F. & Co., received, Dec. 19 seven bars of bullion 786 lbs valued at $7,853.53, from Meadow Valley Co., consigned to New York. On the 26 they received from same place and Co., 6 bars, worth $6,638, also consigned to New York.

INAHO MINE.—This mine, discovered and developed near Corinne promises well.

LITTLE COTTONWOOD.—Cor. same: Among the most promising of the Little Cottonwood mines are the Last Chance and Hiawatha, which have consolidated, and are about 300 feet in a westerly direction from the Montezuma and about 1,500 ft. from the celebrated Emma mine. The Hiawatha was discovered in June 1870, by J. Despain; who with others, located 3,000 ft. thereon, but afterward sold out to the present owners who have since continued the discovery shaft to the depth of 125 ft. exposing a well defined vein of ore, of an average thickness of about 20 inches. Samples taken from the bottom of this shaft and assayed gave $282.76 silver per ton and 50 per cent. metallic lead; but the general average assay of ores from this shaft, of which about 40 tons are on the dump, although carrying about 50 per cent of lead, contains only 50 ozs. of silver to the ton. The course of the Hiawatha is nearly north and south, while that of the Last Chance is northeast and southwest, and possesses all the features of a true fissure running diagonally to formation, or country rock.

It is opened at 3 points by inclined shafts—one 90, one 45, and one 20 ft.—showing a continued vein of high grade ore for a distance of more than 200 ft. in length, and of an average thickness of about 2½ ft. 2,121 lbs. taken at the depth of 60 ft. sampled and assayed, gave 29 per cent. lead, and $308 in silver per ton. 15,-000 lbs. were sold at $52 per ton.

San Francisco Mining Stock Market.

THURSDAY EVE., Jan. 4, 1872.

Mining stocks were in active demand during the week. The sales at the Stock Board for the week ending December 27th were $1,780,000.

There was no meeting of the Board on Saturday or Monday.

The stockholders of the Daney Mining Company have unanimously voted to increase their capital stock from 2,000 shares of $60 each, to 24,000 shares of $100 each. As soon as the necessary papers can be prepared, holders will be presented with the new issue at the rate of three shares for one.

During the ensuing week, $50,000 is expected to be received from the Raymond & Ely mine. On the 29th December, $22,000 was shipped from the Chollar-Potosi mine. Thus far on December account, $101,700 has been received from the Meadow Valley mine. Only 78 tons ore were taken from the Hale & Norcross mine last week, and 450 tons from Savage mins, the latter assaying $31.26 per ton. During the past week, 133 tons ore were raised from the North Star (Grass Valley) mine. The quantity reduced was 208 tons, leaving 120 tons on the dumps. The Superintendent expects to "be able to make mouthly shipments large enough to make up for the time stockholders have been without divideuds."

B. F. Sherwood, William Sharou, and R. F. Morrow have been elected Trustees of the Central Mining Co.

The Board commenced operations in September, 1862. The annual sales compiled by the *Commercial Herald* are as follow:

1864	$25,832,715	1868	$115,943,119
1865	40,205,820	1869	69,989,731
1866	32,825,894	1870	51,186,450
1867	66,274,577	1871	127,191,631

The sales for the past year have been actually $20,000,000 in excess of the amount for the first three years. The nearest approach to the activity which has prevailed during the year just closed was in 1868. The monthly sales of the Board for the two noted years compare as follows:

	1868	1871.
January	$8,688,834	$7,686,934
February	9,716,596	7,256,645
March	11,471,830	12,758,146
April	9,770,363	9,770,363
May	10,162,336	12,511,546
June	9,078,063	13,470,665
July	8,474 988	9,744,269
August	11,612,901	10,536,471
September	10,578,561	11,197,375
October	10,519,442	14,762,764
November	6,148,601	9,104,458
Decembor	7,097,393	8,391,423
Totals	$115,943,119	$127,191,631

The months of August, September and October, in each year, were remarkably active.

THE HOG CROP of Ohio for 1871 is estimated at 1,008,571 hogs—an increase of forty per cent. over that of 1870.

The Sponge.

EDITORS PRESS:—Will you give through the columns of your valuable journsl some information about the preparation and bleaching of the eponge, snd oblige many of your resders bssides T. MEILINOS.

Ssn Francisco, Dec. 1871.

The recent discovery of sponge on the coast of Sants Barbars hss sttracted considerable attention to the possibility of adding the production of thst article to the numerous snd varied industries of Californis. There is a great rsnge in the form and relative fineness and softnese of the spongs, varying in the lstter psrticulsr all the way from the velvety and almost white sponges employed in the toilet, to those of so stiff and compsct texturs, as to crumhle essily when dry, their harshness rendering them entirely useless in the arts. The differsnt varieties are sometimes known as sheep-wool, velvet, glove, yellow, hard hesd and graes. Those found on the coast nesr Ssn Buenaventura, according to the *Signal*, are of very fine quality, and although cast up upon beach, bear every evidence of having their origin in that immediate vicinity. Some sponges live in very deep water, others in shsllow, and they greatly incresse in size and number from cold to warm lstitudes.

The eponges of commcrce are mostly ohtained from the Mediterranesn snd the Bshamas. At the port of Nassau about 30,000 pounds are gathered snnnally. The French and Austrian Governments have begun to raiss the sponge artificially, and the expsriment hss been pronounced not only successful but very profitable. The sponge may be se easily transplanted as the oyster. It ie propagated naturally by little hairy germs, carried out of the hody of the psrsnt by currente, which, after floating about awhile, much like the oyster, finally atsch themselves to a rock or some other convenient substancs and then commence their permsnent growth. If a young and vigorous eponge ie taken from its originsl location and transplauted—its roots being properly secured—it will continue to increase in growth, and also throw off germe for new individuals. The pores of the sponge are its mouths, through which it receives ite nourishment—its roots are merely the mesns of retsining it in place, not for receiving nourishment.

The sponge is considsred the connecting link between auimsl and vegetabls life. A jsllylike substsnce fills the pores of the living eponge, which msy he considsred its *animal* euhstsnce, while the fibrous materisl which remains after thst is removed—and which constitutes ths sponge of commercs—coustitntes its *vegetable* suhstance.

In the larger and cosrser varieties the animal matter is very ahundsnt, and of a sickish, disagreeable odor, and eoon enters into putrefaction when removed from the rocks and bronght to the eurface. Such sponges are buried in dry sand until ths animsl mstter hss hecome thoroughly pntrefied, when they are plsced in iron csges and suhjected to the action of the tides. The cslcareous matter, which is also more or less abundant in sll the varieties, is dissolved out by immersion of the sponge in very diluts hydrochloric acid. They are first thue soaked, then drisd and heaten until all esrthy mattere hsve been removed.

To bleach eponges, the finest ars selected, and aftsr the above treatment, thoroughly washed in clear water and then submitted to another bath (this time warm) of diluts hydrochloric acid, in which 6 per cent. of hyposulphate of sods has bsen diseolved. After remaining in this hath from 24 to 48 hours, the sponge, if of a fine variety, will be as whits as snow or "sheep-wool"—the uame hy which it is known.

Sponges ars found as far north as Great Britain, on ths shore of which, it is said, not less than 24 species have been noticed. The climate of the southern part of this State is prohahly as well adapted to the growth of this article ae are the French and Austrian shores of the Mediterrsnean. Experiments in their cultivation here would undoubtedly meet with much success and profit.

SENSATION IN HORSES.—The fact that horses and other animals with broken limhs do not appear to lose their appetites, have led some scientific men to raise the question whether these creatures suffer as much under the circumstances as men do; for a man could not sit quietly down to dinner just after hreaking his leg.

The Beet Sugarie at Sacramento.

We condense the following facts with regard to the Sacramento Beet Sugarie from the Saucelito *Herald:*

The success of this sugarie has more than ordinary interest, because the process is essentially diffsrent from that at the Alvarado. The two processes are in rivalry. The Gsrmans at Alvarado insist that their system is superior; while the manages at Sacramento, also Germans, proclaim their "Rohsrt, Diffusion process" cheaper hy thirty per cent. in cost of lahor and in cost of construction, and richer in yield of sugar.

The advocates of the Alvarado process, long in general use, say the sugaries of Germany which had heen changed to the Diffusion system, are changing hack again; while Sacramento has advices of opposite import. It is impossihle to convey an intelligent description of Robert's process without diagrams. But we may say that, while beets are *rasped* at Alvarado, and the juice extracted by centrifugals; at Sacramento the heets are *cut in thin slices* and macerated in cold water, dispensing with the use of centrifugals. It is claimed that the juice is thus more perfectly extracted, and requires less chemistry in pnrification. Certainly it saves much power and costly attendance, and it is equally certain that, by either process, sugar making in California is a success.

The *Herald* suggests that the Chamher of Commerce of this city invite Mr. Wadsworth, of Sacrameuto to give a puhlic lecture, with diagrams illustratiug both processes, and adds that while couuties and cities are giving aid to railways it should he remembered that beet sugaries also merit consideration. They return twenty-five per cent. yearly profit; they utilize 1,000 acres of land each; each gives employment to at least 125 hands, directly; and no population is more esteemed in Europe than that of sugar towns.

It may he added that the sugarie at Alvarado has inaugurated a system which ensures constant occupation. When the stock of beets are worked up, the mill is converted into a refinery of cheap imported sugars, which is also very profitahle.

The sugarie at Sacramento intends to prolong the season of sugar making hy planting melons. They yield sugar equal to heets, and the crop will add three months earlier milling. Besides, we can grow melons on soil not adapted to beets; and the melon eyrup is excellent for tahle use, while beet syrup is fit only for distillation.

AN IMPORTANT DISCOVERY IN TANNING.—It appears, from investigation, that Western Texas has, in inexhaustihle quantity two of the hest tanning materials known to the world. The wood as well as the hark of the mesquite. a species of timher that ahounds in great quantity, is found to be rich in tannic acid—nearly as rich as live oak. A remarkahle and importaut quality of the tan of the mesquite, however, is that instead of heginning on the surface, it strikes through and through, inciein‌g into the hide, revealing the fact that the process of tanning goes on in the centre equal with the surface.

The experiments made are said to have demonstrated that the wood of the mesquite is fully equal to black-jack, which stands among the richest harks we use although the live oak is much richer than either. A letter from Texas on the suhject says the discovery will have a very important effect in the supply of our country and the world with the necessary article of leather, the demand for which is constantly on the increase. The interest in this discovery and its value increases from the fact of the rapid exhaustion of the materials for tanning in our country, and in many other parts of the world.

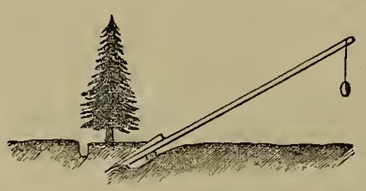
UTILIZING LEAVES.—Most of our readers are familiar with the late discovery by Mr. E. T. Bugbee, of Vermont, of the new use of leaves as a substitute for bark in tsnning. He finds that leaves and bark, in equal proportions, make better, more flexible, and smoother leather, than hark alone, while the work is done in less than half the time.

Some of the French economists are utilizing leaves in a different way; which, if the alleged discovery of Mr. Bugbee is as represented, is rather a waste than otherwise. It is said that the authorities of Paris are gathering up the leavee which fall from the trees in the parks of that city, pressing them, by machinery, into hard masses, and distributiug them among the poor for fuel.

Transplanting Large Trees.

The transplanting of large trees, which it is now well understood can he made a success hy proper care in moving with them a large mass of earth, would he much oftener practiced were it not for the great difficulty and inconvenience attendant upon their removal. A correspondent of a late numher of the *Country Gentleman*, however, has communicated to that paper a very convenient device, hy which the lahor of such work is greatly simplified. The trees on which he experimented were arhorvitæs, some fifteen feet high, trees which it is well known are extremely difficult to transplant with success. The weight of earth which he removed with the trses was as much as three men could lift.

The suhjoined diagram conveys a very distinct idea of the manner in which they were taken up. A cut should he made en-



tirely ronnd the tree, and two or more levers might he used, according as the size of the tree might require. After the lever is placed it should be raised up as high as possihle to insert the block or fulcrum, and the wedge upon top should be driven to its place after the fulcrum is adjusted. The wedge should be made quite hroad, and driven well under the roots. If properly adjusted and proportioned to the size of the tree, the latter will be easily raised.

The Air-Tight Stove.

The most economical and healthful stove which can be employed for heating rooms is the "air tight," and wood is decidedly the hest kind of fuel to be employed. In employing such etoves, however, care should he taken that a small vent he left opsn for the escape of gases up the flue, so long as the wood continues to *blaze*. Green and even dry wood, when first lighted, throws off large quantities of eteam and gases, incomhustihle in an ordinary "air tight," which must be allowed to pass off, else the gases will either gradually escape into the room, to the great detriment of health, or they will collect in the stove until sufficient heat is generated to fire them, when an explosion will come, attended with unpleasant if not disastrous consequences.

Moreover, so long as the wood continues to hlaze, whatever the quautity put in, the stove never throws out so mnch heat as it does after the wood has ceased to hurn with a large flame, and the dampers of the stove can he safely closed. In a sick chamber, especially, the dampers should never he closed so long as a small blue flame is observed burning over the hright embers.

Lighting the Fire in a Stove.

Many persous have often noticed the extreme difficulty encountered in lighting the fire in a stove especially in a still, damp morning. The stove at first won't draw, even vigorous "blowing" will not euffice; and then when it does start, it is with a sort of an explosion or outward rush of air which fills the room with smoke and gas, ofteutimes puffing the unpleasant fumes into the face of the operator.

This trouhle is caused by the difficulty encountered in overcomiug the inertia of the long column of air in the pipe or chimney, hy the small volnmn of air that can he forced up through the interstices of the wood and coal, at the hottom of which the fire is kindled. All this may be remedied hy simply putting a few shavings or hits of dry paper on the top of the wood or coal, and first lighting that, it immediately hursts into a hlaze, hecause the air has perfectly free access to it from all sides, the heated air forces its way into the chimney and establishes there an upward current. The match can then he applied to the kindling *under* tho fuel which will readily light and, if dry, hurst into a hrisk blaze.

BOY HUNTERS.—Two hrothers of Yreka, aged 16 and 17 years respectively, have, this season, killed seven hears, two of them grizzlies, a large numher of deer, and found thirty-seven hee trees, and attended school during term time.

The Movements of Insects.

In the sultry noontide, seated under the shadowy grapevine, I often admire the husy hlack ants marching up and down or pausing to milk their aphide cows that feast sumptuously on the delicate, juicy young tendrils of the vine. Then, as the day declines, I love to rest on the hillside and gaze on the myriad of ineects floating in cloud-like masses over the valley, and reflecting the light of the sun now fast sinking in the west. Almost simultaneously with their swarming, the evening birds dart suddeuly from secret recesses, and devour with wide extended jaws and unsuspended flight their hountiful evening meal. Why can I never see these hirds in the act of coming? Verily, the work of the fifth day of creation seems daily repeated, and "fowl fly above the earth in the open firmament of heaven."

The groups of gay insects that sported in the sunshine, their heads turned windward as though enjoying the draught of the warm summer hreeze or the aerial food thus wafted to them unsought, disappear with the setting of the sun. Then the sphinxes and the night heetles turn out in force, and the large hawkmoths hover round the phoix of the garden, and silently oxercise that "right to life, liberty and the pursuit of happiness," which the cricket, the katydid and their fellow musicians noisily assert.

The men of this generation rejoice in their conquests over time and space, in their iron horses and palatial cars. "The horrid things that crawl" and fly have no voice intelligihle to man, or they might advance just claims to the possession and practice of every kuown variety of locomotion in a degree of perfection that proud man, with all the aid of mechanism, can only rudely intimate. As larva, pupa or imago, the insect moves under the earth, upon the earth, ahove the earth—under the water, through the water, on the surface of the water—on tree and herh and grass—on insect, bird and heast—in living tissues and in the dead—psrhaps in the else all consuming fire.—*Lippincott's Magazine.*

BOILER INCRUSTATION.—From a recent discussion and interchange of views upon the snhject of the incrustation of hoilsrs, hy many of the master mechanics of the railroads through the conntry, it was very generally asserted says the *American Manufacturer*, that the hest method of keeping hoilers clean is to wash them out once a weck—not hlow them off, as the heat required for this purpose hardens the paste deposit and forms the scale, whereas if hoilers were washed out after cooling, with water in them, this paste can he almost entirely removed. The testimony of some parties who practice this plan seems to show that boilers can he so nsed for many years without being troubled with scale. It was found that many parties practice the removal and renewal of tuhes, in locomotive boilers, quite frequently to remedy the scale difficulty, and that the hlow-off effected little else hut the removal of mud. The washing process recommended, seems like a rational and practical one.

ANCIENT MUSIC.—The Egyptian flute was only a cow's horn with three or four holes iu it, and their harp or lyre had only thrse strings, the Grecian lyre had only seven strings, and was very small, heing held in one hand; the Jewish trumpets that made the walls of Jericho fall down wers only rams' horns; their flute was the sams as the Egyptian; they had no other instrumental music but by percussion, of which the greatest hoast made was the psaltsry, a small triangular harp or lyre with wire strings, and struck with an iron needle or stick; their sachut was something like a hagpipe; the timhrel was a tamhorine, and the dulcimer was a horizontal harp, with wire strings, and struck with a stick like the psaltery. They had no written music; had scarcely a vowel in their language; and yet (accordiug to Josephus) had two hundred thousand musicians playing at the dedication of the temple of Solomon. Mozart would have died in such a concert in the greatest agonies.

THE FIRST CHINESE PATENT.—A Chinaman of Canton, China, named Lee Ping, and another of San Francisco, named Pon Jih, doing business together in the latter city, have made application to the Patent Office for a patent on a trade mark for their tea. This is the first application from the "Heathen Chinee" to the Patent Office.

THERE are 78 railroads in Germany owning 19,145 miles of road.

Useful Information.

The Gloss on Silk.

The method of giving an artificial gloss to the woven pieces of silk was invented in 1663. The discovery of the method was purely accidental. Octavia Mey, a merchant of Lyons, being one day deep in meditation, mechanically put a small bunch of silk threads into his mouth and began to chew them. On taking them out again in his hand he was struck by the peculiar lustre they had acquired, and was not a little astonished to find that this lustre continued to adhere to the threads even after they had become dry. He at once saw that in this fact there was a secret worth unravelling, and being a man of ingenuity, he applied himself to the study of the question. The result of his experiments was the "glossing method."

The manner of imparting the artificial gloss has, like all other details of the weaving art, undergone certain changes in the course of years. At present, it is done in this wise: Two rollers revolving on their axes are set up a few feet from the ground, and at about ten yards, in a straight line, from each other. Round the first of these rollers is wound the piece of silk, of 20, 40, or 100 yards in length, as the case may be. Ten yards of the silk are then unwound, and fixed by means of a brass rod in a groove on the second roller, care being taken to stretch the silk between the two cylinders as tightly as possible. A workman with a thin blade of metal in his hand, daintily covers the uppermost side of the silk (that which will form the inside of the piece) with a coating of gum. On the floor under the outstretched silk is a small tramway, upon which runs a sort of tender filled with glowing coals. As fast as one man covers the silk with gum, another works the tender up and down, so as to dry the mucilage before it has had time to permeate the texture.

This is a very delicate operation; for if, on the one hand, the gum is allowed to run through the silk, or if, on the other, the coals are kept too long under one place, the piece is spoiled. In the first instance, it would be stained beyond all power of cleaning, and in the second, it would be burned. None but trusty workmen are confided with this task; and even with the most proved hands there is sometimes damage. When ten yards of the piece have been gummed and dried, they are rolled around the second cylinder and ten more are unwound. This is repeated to the end. But the silk, with its coating of dry gum, is then stiff to the touch and crackles like cream-laid note-paper when folded. To make it soft and pliant again, it is rolled anew, some six or seven times, under two different cylinders, one of which has been warmed by the introduction of hot coals inside, and this is sufficient to give it that bright new look which we all so much admire in fresh silk.

Spiders' Silk.—Speaking of the silk produced by a certain species of spider, Dr. Wilder says: "If you can picture to yourself a mass of pure yellow gold, which not only reflects the light as from a smooth and polished surface, but which has all the depth and softness of liquid amber, you may realize in some degree the wonderful appearance of a sheet of spider's silk as seen in the sunshine; and even in the shade its lustre is greater than that of gold. But to compare the silk to gold is to tell only one-half the story; for the same spider yields silver as well, so that you may draw from its body a thread of silver, or both threads together; their union giving silk of a light yellow color."

A Chinese Wind-Barrow.—One of the strangest sights in China is their wind wheel barrow; it is drawn by a donkey, and when the wind is fair a sail is set. The wheel turns in the middle of a wooden frame, sustained by iron bars. Upon the frame are hung all kinds of utensils. The donkey is generally mounted by the paterfamilas, the son and heir is at the stern assisting all he can, while the mother and younger ones ride on the vehicle.

The Brain.—It is said that the brain of an idiot contains about one per cent. of phosphoric matter, that of persons of sound intellect, 2½ per cent., while that of the maniac contains 3½ per cent. If this be so, it would seem that in a maniac the brain appropriates an undue proportion of phosphoric matter from the rest of the system, whereby its functions are materially impaired.

Scientific Amusement.

The *Pall Mall Gazette* conveys to its readers two delightful little experiments in vivisection. We reproduce them, as tending to afford both amusement and occupation for leisure moments:

No. 1.—Insert in the back of a rat the end of its own tail, having first pared it raw with a bistoury; it will heal and take root. As soon as the graft is complete, amputate the tail about one third of an inch from the old root. The rat's tail will thenceforward grow the reverse way and out of the back. During the first three months the rat will evince very feeble signs of feeling when the tail is pinched. At the end of six or nine months, the sensitiveness of the part will have much increased, but the animal will not yet be able to guess where it is pinched. After a year, he will, however, be completely up to the trick, and will turn to bite the pinchers.

No. 2.—If you amputate the paw of a young rat, partially skin it, and introduce it through the skin of another rat's side, it will engraft, take nutriment, grow and acquire all the ordinary parts of its structure, as if it had remained with its former proprietor.

The latter experiment is decidedly ingenious, reflecting great credit on the inventor for his originality. Possibly, the rats may object.

Ancient and Modern Workers in Wool.—Under this caption the "Bulletin of the National Association of Woolen Manufactures" for April, copies the letter of our correspondent, Mrs. B., of Minneiska, Minnesota (telling how she worked up with a knitting machine some 250 pounds of wool, and pronounced it not only "a recreation," but profitable withal), with the following handsome preface:

We have often vainly sought for a worthy parallel for the ancient Romen matron whose tomb in the Eternal City bears the epitaph commemorative of her domestic virtues; which were to "stay at home," and "work up wool."

Domum mansit,
Lanam fecit.

We find the parallel at last in the Minnesota lady, who penned the following article for the *Western Rural*. But if there is a parallel, there is a contrast. Who,—that compares the Roman woman peinfully toiling with her distaff all day for a feeble product, with the American matron, by aid of modern invention, running off in mere sport her 1,500 stitchee a minute, and turning out at odd moments a product which meets most of her family expenses, — can say that the material science of modern times has done nothing for domestic happiness.

Dust Everywhere.—There is dust on the sea, on land, in the valley and on the mountain-top; there is dust always and everywhere; the atmosphere is full of it; it penetrates the noisome dungeon, and visits the deepest, darkest caves of the earth, no palace door can shut it out, no drawer so secret as to escape its presence; every breath of wind dashes it upon the open eye, and yet that eye is not blinded, because there is a fountain of the blandest fluid in nature incessantly emptying itself under the eyelid, which spreads it over the surface of the ball at every winking, and washes every atom of dust away. But this liquid, so well adapted to the eye itself, has some acidity, which, under certain circumstances, becomes so decided as to be scalding to the skin, and would rot away the eyelide were it not that all along the edges of them there are little oil manufactories, which spread over their surface a coating as impervious to the liquids necessary for keeping the eyeballs washed clean as the best varnish is impervious to water.

Gold Pen Points. — Gold pens are dipped with iridium, making what are commonly known as "diamond points." The iridium for this purpose is found in small grains in platinum, slightly alloyed with the latter metal. In this form it is exceedingly hard, and well adapted to the purpose of the gold pen maker. The gold for pens is alloyed with silver to about sixteen carats fineness, rolled into thin strips, from which the blanks are struck. The under side of the point is notched by a small circular saw, to receive the iridium point which is selected by the aid of a microscope. A flux of borax and a blow-pipe secures it to its place, and the point is then ground on a copper wheel with emery.

Good Health.

SALIVATION.

[Written for the Press.]

Selivation is literally an unnatural flow of saliva or spittle. As the seliva is secreted by the parotid, submaxillary and sublingual glands, salivation is the result of unusual irritation of those glands, caused by the presence of some poisonous substance introduced into the system. It is the first symptom of the action of the peculiar poison; but unfortunately not the only one, and is only the introduction to more serious consequences as will be shown hereafter.

Several drugs are capable of producing salivation; yet it is my purpose to speak of but one in this article, which stands preeminently in the front rank.

Mercury

Has been used as a medicine since the 15th century, and owing to its uniform and certain effects upon the glandular system, it has been called the "great alterative."

Its action, however, is not confined to the glandular system, for all the tissues, even the bones are affected, and in time destroyed by it.

The condition produced by mercuriel poisoning is technically call *hydrargyrosis*.

How it is Introduced.

To produce its effects upon the organism, it is not, by any means, necessary to pass it into the stomach, for the skin and mucous membranes are capable of absorbing it, and often do so, sufficiently to produce its most violent and destructive constitutional effects. By experience this fact is too well known by those whose business requires them to handle it frequently or almost constantly—miners for example. Heat will evaporate it rapidly; but like water it will evaporate at a low temperature, even when undisturbed. Place a quantity of it in an open vessel in a house, and it will vaporize sufficiently to salivate the inmates of the house. Amalgam left exposed to the action of the atmosphere and moderate warmth, will do the same thing, only in a less degree. Agitation favors its evaporation, as is well known by those who work around quartz mills.

Inhaling the fumes which sometimes are carelessly allowed to escape from a retort, and working with the hands in contact with the metal are the quickest and most common ways in which the poison is introduced into the system, by accident.

Its Effects.

The first noticeable effect of mercury is upon the salivary glands (salivation); then follows soreness and ulceration of the gums and inside of the mouth. If this is extreme, the teeth loosen and fell out, or else decay rapidly. It then attacks the throat, producing fearful ulceration, and sometimes mortification and destruction of the soft parts. Accompanying these conditions there is a very offensive odor of the breath. Its destructive effects frequently extend to the stomach and bowels, producing inflammation and ulceration, with, sometimes, fearful hemorrhage (bleeding).

Its effect upon the blood is to decompose it, make it thin and dark-colored, and in a great measure deprive it of the power to coagulate when exposed to the air.

Hemorrhages may occur from the nose, the throat, the lungs, or the stomach or bowels; or the blood may ooze out of the blood vessels into the cellular tissues in spots under the skin.

Its effects upon the bones are, first, *periostitis*, or inflammation of the covering membranes; and secondly, *caries*, literally, rottenness of the bones.

Its effects upon the skin are to produce perspiration, and also to produce eruptions and ulcerations. With the lax and soft condition of the skin and constant perspiration, there is great liability to take cold; while, at the same time, all mercurial affections are greatly aggravated by taking cold.

Mercury also produces *ozena*, ulceration of the nose; *iritis*, inflammation of the iris of the eye; neuralgia (nerve pain); rheumatism, gout; falling off of the hair, trembling of the limbs, and even paralysis,

It produces swelling and induration of the liver, testicles, mesenteric, parotid, cervical, axillary and inguinal glands.

The above are only a part of the poisonous effects of mercury; but enough has been enumerated to show clearly its terribly destructive tendency, and its positively destructive effects whenever introduced into the organism by whatever means soever.

Shun the Danger.

The terribly destructive effects of mercury upon the body, as already shown, have had the effect to lessen its use very materially as a medicine, and as a knowledge of the action of medicines increases, it is believed that the time is not distant when it will be looked upon as a criminal act for a physician to salivate his patients, ever so little.

My words of warning, however, are addressed particularly to miners, mill-men, and all others who use mercury largely in their business.

If the adage, "An ounce of

Prevention

Is better than a pound of cure," ever had any force in any case, it does most emphatically in this; for it is a hundred fold easier to keep it out of the system, than to get it out after it has found a lodgment there. To accomplish this the following precautions cannot be too closely observed.

1st. Neither mercury nor amalgam should be kept in the house, and especially in the sleeping apartments, without being bottled and closely corked.

2d. Persons working at quartz-mills, or those employed in retorting or handling mercury in any way, where fumes from the mercury are liable to arise, should avoid them by keeping on the windward side as much as possible.

3d. Clothing, worn through the day, should never be worn at night, nor should it be allowed to remain in the sleeping apartment at night.

4th. The strictest cleanliness should be observed. A thorough bath once a week, at least, is almost indispensable. The clothing worn at work should also be thoroughly cleansed at least once a week. It should also be hung out and exposed to the action of the wind and rays of the sun quite frequently. By so doing the particles of mercury which have found lodgment there, will be liberated and driven off.

5th. The mercury should never be allowed to come in contact with the hands or any other part of the body, for wherever it does, some of it is almost sure to be absorbed.

6th. Fumes of mercury should never be allowed to escape from the retort, but should be condensed with particular care.

Cure.

Unfortunately in hydrargyrosis as in almost all other affections, no single remedy can be relied upon as a specific in all cases; but it has to be treated as the condition indicates. I will, however, enumerate some of the most important remedies for that purpose:

For violent bone pains, ulcere of the mucous membrane, and congestive symptoms, nitric acid.

For periostitis, phosphoric acid.

For caries and necrasis, asafœtida and phosphorus.

For ozena, aurum muriaticum.

For mercurial rheumatism and gout, glandular enlargemens, cutaneous eruptions, tubercles and ulcere, indurations of the liver, parotid, cervical, axillary and inguinal glands, iodine and iodide of potassium.

For ptyalism, chlorate of potassa, and creosote.

Other most excellent remedies, frequently used in the treatment of hydrargyrosie are sarsaparilla, conium, sulphuret of lime, sulphur, sulphate of zinc, galvanic electricity and cinchona; but it would be impossible to give their special indications in an article of this kind, as the affections arising from the same are so varied, and so often associated and complicated with the scrofulous, syphilitic and sycotic dyscrasias.

My advice to all is, first, avoid by all means the absorption of the poison; second, if the poison has already been absorbed get rid of it as soon as possible.

E. J. Fraser, M. D.
No. 102 Stockton street.

Extreme Old Age.—A farmer lately died in East Prussia who is said to have attained his 130th year. Down to the time of his death he was in the enjoyment of the best possible health. He was six feet one inch in hight and served as bodyguard under Frederick the Great. His son, who lives on his father's property, is 109 years old. He takes long walks every day, can read without spectacles, and is an excellent companion. The nephew of the old man is employed on the East Prussian Railway, and, though he is 72 years of age, he is able punctually to perform his duties.

With 1872

Commences volume XXIV of the SCIENTIFIC PRESS. Its life of nearly 12 years, we verily believe, has saved more to the PACIFIO States, aud imported more profitable and practical knowledge to personal readers than any other journal in this new and still developing field. We wish to increase our usefulness. We want more subscribers added to our already large list. The publication of such a first-class paper is expensive. We shall make the PRESS worthy of double its present circulation this year.

Every old subscriber who can feel the value to himself and the community of a journal that seeks its patronage through articles iustructive, elevating, and interesting, and without trash or sensation, we earnestly solicit to renew his own subscription and to speak a good word for the PRESS to others. The commencement of a new year and volume is a good time to

SEND US YOUR SUBSCRIPTIONS.

Mining Accidents.

On Dec. 26, a mass of rock in the 600 ft. level, east of the Idaho mine, at Grass Valley, caved upon Tobias Mitchell, breaking his right thigh and otherwise seriously injuring him.

On Dec. 23, a miner named Dennis Hays was badly hurt in the North Star mine, Grass Valley, by being caught in the shaft by an ascending car.

On Dec. 23, both the car and cage in the Hale & Norcross mine, at Virginia, fell a distance of 1,300 ft., severely injuring a miner named Wm. McCleery.

Harry Howarth, a miuer employed in Moser's claim at Mokelumne Hill, was badly bruised a few days since hy a rock falling upou him.

HOME MANUFACTURE.—An iron rope, weighing 9,500 lhs. has just heen completed at Hallidie's Wire Rope Works, in this city. It is five inches wide, one-half inch thick, and 2,000 ft. (nearly half a mile) long. One hundred and fifty miles of 15½ guage wire was used in its construction. It is the first rope manufactured entirely of California-made wire, and the largest ever turned out in America. It will be immediately shipped to Virginia City, Nevada, for use in the Empire-Imperal shaft of the Imperial Mining Company. This Californiu Wire Rope Company are the ouly mauufacturers of flat iron rope in the United States. They have now on the way from Europe, improved machinery for making what is termed flexible wire rope. It will run 13 bobbins, and lay up a rope of 144 wires, with 19 wires in the straud.

The State Geological Survey.—No. 1.

An Important Question.

Prominent among the questions which the present Legislature will be called upon to decide, is that of the further continuance or the discontinuance of our State Geological Survey.

This work was commenced in 1861, and continued without intermission until the close of 1867. It was then discontinued for two years, owing to the fact that the Legislature of 1867-8 made no appropriation for it. But it was again taken up by the Legislature of 1869-70, and has been carried on during the last two years under the appropriation of $2,000 per month, then made for its continuance.

It thus appears that the work of the Geological Survey has extended through a period of about nine years; and the questions very naturally arise, what is the character of this work; what have been its results in the past; what are they likely to be in the future; and what is their practical value to the State at large?

If, as some believe, the Geological Survey is doing nothing and producing nothing but elaborate pictures of extinct shell fish and minutely scientific descriptions of hugs, then we may well be excused for believing that "the play is not worth what it costs." But if, on the other haud, it shall appear that it is in reality an earnest investigation hy able hrains and skillful hands of the material resources of the State, and especially of her mineral wealth, as well as of the history of the formation of her mountain ranges, the cutting out of her tremendous cañons, the growth and extinction of her immense volcanoes on a scale of grandeur far exceeding anything the continent now shows, the extent of her mines of coal and quicksilver, the distribution of the gold in her rocks and veins, the character, extent and origin of her vast masses of auriferous gravel, the formatiou of her broad and fertile valleys, the capacities of her soil, the laws which govern her kaleidoscopic climates, in a word, the whole physical structure of her frame;—if the money hitherto devoted to this work by the State has heen wisely and economically expended in the gathering of reliable information upon subjects such as these, and if the Chief of the Snrvey is husily employed in sifting and classifying the mass of information so ohtained, deducing order from what has hitherto heen chaos, gradually solving the difficult problems of our peculiarly complex geology, and presenting as rapidly as possible in systematic and intelligible shape, the results of all this work in his reports and maps, for the benefit of the people at large, and for their guidance in important practical questions of agricultural and mining industry,—then the matter assumes an altogether different shape, and the question is rather, can a State like California afford to stop a work like this before it be completed?

We have recently been investigating with considerable care the work of the Geological Survey and the present status of its affairs, and propose to give to our readers the results of our investigation.

The General Character of the Work.

Before entering into details, however, we will give a short sketch of the general character of the work, its purpose and its aims. And in doing this, we shall make the freest use of an article which appears in the January number of the *Overland Monthly* from the pen of a writer who is evidently well acquainted with the suhject, and knows of what he spcaks.

The object of the Geological Survey may be best made intelligible by stating that it is taking au inventory of the "natural resonrces" of the State, and hy the term "natural resources" is meant the innumerable good things which she has inherited from mother Nature,—her soil, valleys, mountains, plains, rivers, lakes, the treasures of mineral and metallic wealth which lie beneath her surface, the oreatures which live upon her soil and in her waters, the plants which grow within her borders, these all need to be cataiogued just as a merchant ueeds to have his stock of goods inventoried, or a farmer the boundaries and the quality of his fields determined.

That the Legislature which in 1860 set this survey on foot took this comprehensive view of the subject is clear euough; for the Act authorizing the work calls for "an accurate and complete geological survey of the State, with proper maps thereof, and a full and scientific description of its rocks, fossils, soils and minerals, and of its botanical and zoölogical productions." This was the language of the original Act, and it has not only never been repealed, but it has been confirmed again and again by successive Legislatures. Such therefore is the work which it has been the duty of the State Geological Survey to accomplish, so far as the means which have been placed at its command would permit.

Topography.

It seems hardly necessary to point out the desirability of a geographical basis for the geological work, or the impossibility of any accurate delineation or intelligible description of the geological features of a country without a correspondingly accurate knowledge of the situation, extent and outlines of its mountain ranges, their altitudes above the sea, the courses of its streams, the location and extent of its valleys; in a word, of just such features as those which are shown upon good topographical maps. Geological determinations, in fact, unless made available and permanent by being recorded upon suitable maps, are of little value, and of hardly any accouut for practical use. To be available, the informatiou must be accurately located. As well might one attempt to paint a picture on the air, or put a roof on a house before the walls were built, as to convey geological information without a map on which it can he embodied.

Physical Geography.

Closely allied to the topography proper, is the physical geography of the State, or tho study of the geographical facts from a generalized point of view; for iustance, as related to the climate, and thus as bearing directly ou the agricultural and sauitary condition of the people. Consider for a moment how important even one class of simple facts in this department may become. We refer to the determination of hights above the sea-level, by which the relative differences of elevation are determined and the form of the surface made out. This kind of information is of the greatest practical value in its bearings on all questions of drainago, irrigation, road building and the like. There is hardly any great branch of industry in the State which may not he in some degree benefitted hy this part of the work.

Geology.

It is popularly supposed that the geological part of the Survey moans merely "prospectiug" the ground for the purpose of making new discoveries of valuable deposits of ores or minerals. This is by no means the case. There are prospectors enough already in the field. It would be difficult to find a gulch in California iuto which some indomitable individual had not already penetrated; neither would it be easy to find any kind of worthless rock, which had not been supposed by some one to be of value. The object of the Geological Survey is something very different from mere prospecting. It is, rather, to examine everything which has been already discovered, and from the accumulation of such observations to combino the experience and knowledge of all, so that general results may be obtained which shall be of great value as tending to put a stop to wasteful expenditure and misdirected explorations; while iucidentally of course a large amount of information is gained which is of essential service in properly guiding the active exploration and development of our mines. The Geological Survey makes no pretensions to the kind of knowledge that is claimed by the charlatans of the "diviniug rod" and the "goldometer."

It is folly to suppose that the geologist should always be able to tell beforehand precisely where a shaft must be sunk or a tunnel driven to strike rich pay. No man can see through fathoms of solid rock. No good geologist or mining engineer ever pretends to do it. But he ought to be able after a careful examination of the ground to understand and weigh the *probabilities* of the case with a sounder and better founded judgment than a man of less experience and information can do. And with reference to the mines it is precisely those facts of observation and practical experience combined with a proper knowledge of the character and distribution of rocks and ores upon which the judgment of a reliable mining engineer is always based, that it is the province of the Geological Survey to gather, and systematize, and publish to the people for their better guidance in the ever-hazardous work of mining enterprise.

Having thus briefly touched upon a few of the most salient points iu the broad field which a geological survey of a State like California should cover, we propose in our next issue to give some definite account of what the survey has actually heen doing, and then to enquire in how far it has met or has failed to meet the requirements of the original Act which ordered it, and the legitimate expectations of the people.

Our Borax Deposits.

Within the past two years large deposits of the Borate of lime and the Borate of Soda have been discovered at various poiuts in the State of Nevada, the most extensive being those of the Columbus and the Fish Lake Valleys, situated in the southern part of Esmeralda county. At Rhode's Marsh, 15 miles north of Columbus, the quantity is also represented to be quite large. The other localities where this material has been found in considerable abundance, though not always sufficiently concentrated to render it readily available, are near the Hot Springs on the Central Pacific Railroad, a short distance northeast of Wadsworth; at Sand Springs, on the old overlaud stage route, 12 miles east of Carson Lake; at Double Springs, 10 miles east of Burgess' old, now Campbell's station, on Walker River, as well as on the large alkali plain, 30 miles still further east; at Teal's Salt Marsh, 10 miles west of Columbus; in Death Valley and about the siuks of the Amargosa and the Mohave.

In some of these localities the Borate of both lime and soda are met with, while in others but one of these suhstauces is found. There is, for example, but little of the latter at the Hot Springs, while at Saud Springs, Teal's Marsh and Double Springs, the deposit consists chiefly of the Borate of lime. At Rhode's Marsh and in Columbus and Fish Lake Valleys, the two substances occur intermixed and in great ahundance. So little soda is there in the Hot Spring deposits that parties experimenting in the manufacture at Wadsworth, with raw material from that locality, are ohliged to seek the requisite amount of soda elsewhere, obtaining it for the present from a small pond in the vicinity of Ragtown, 30 miles distant.

Owing to this and other ohstacles these parties have not yet met with much success, but little merchantable borax having thus far been turned out from these works at Wadsworth. At Ragtown, J. V. Lewis is producing some 200 pounds of refined horax daily. He procures the crude suhstance from Sand Springs, 25 miles distant, being unable to carry on the refining process at a nearer point for want of wood and water. He is said to make a good article, though operating on a small scale, and laboring under some disadvantages.

These two are the only points in the State of Nevada at which the manufacture of borax or even the concentration of the crude article has yet been attempted. A considerable amount, not less; perhaps, than sixty or seventy tons of the Borates, has been shipped to this city, where it was subsequently worked and disposed of through local dealers, whose customers gave it a preference over the imported article, it having been found of greater purity and strength than the best English borax.

There seems now no question but we have the native product in great quantities on this coast; a late careful examination made in the interest of the Nevada Consolidated Borax Company estahlishing the fact that they have several hundred thousand tons of the Borates within the limits of their survey in the Columbus and Fish Lake Valleys. This company have, however, without any doubt, not only the most extensive, but in every respect the most valuable deposits to be found on this coast, or perhaps, elsewhere in the world. The quantity covered hy their claim is ample to meet all the requirements of

commerce, the substance here existing under the most favorable conditions, save only the cost of transportation to market. These beds are 150 miles from Wadsworth, the nearest point on the Central Pacific railroad, the intermediate country being sandy, hilly and barren, rendering the road a hard one to freight across.

This company, however, having ample means, propose to obviate this trouble by the construction of an improved wagon road, and possibly of a railroad at an early day. Meantime, they will erect works and proceed to concentrate the Borates on the ground, preparatory to their shipment to market. The members of this company are mostly residents of Sacramento, and, besides being men of large means, have an excellent standing in the business community, and who having embarked earnestly in this enterprise, will be likely to make it an early and an entire success.

While the Borates exist so plentifully at a few points in the State of Nevada, it is, nevertheless, the case, that their distribution is by no means so general as was at one time supposed; it having transpired through numerous tests lately made of material obtained from different localities, and supposed to be rich in boracic acid, that it contained but little, and in many instances not even a trace of that substance. In consequence of this determination thousands of acres of land that had been taken up in that State, the locators having mistaken the carbonate of soda and the chloride of sodium for the Borate of soda, will have to be abandoned.

But while the supposed Borate fields of Nevada are thus likely to suffer curtailment, rumors come to hand of important discoveries of this material having been made in Del Norte county;—a quantity rich in this valuable salt having lately been brought to this city, said to represent a large deposit existing in that quarter of the State. How much there may be in fact, or what would be the cost of hauling to a shipping point, we have not been able to ascertain, though there is reason to believe that the quantity reported, has, as is usual with the first announcement of mineral discoveries, been somewhat exaggerated.

The Rainfall.

The late storm has been one of the most remarkable which has occurred since the advent of the Americans on this coast. For over two weeks, with slight interruptions, it rained more or less of the time, day and night, until the 2d instant. Now, however, the storm seems to have fairly passed away, and at this present writing the sky is beautifully clear and pleasant.

The amount of rain which has fallen has also been remarkable—probably the largest amount which has been recorded in so short a time since 1849—and when added to that which had previously fallen during the season, makes the largest total on record up to December 31st. It may also be added, as another remarkable fact, that no great storm, with an equal rainfall, has done so little damage, or, so far as present appearances show, been productive of such a vast amount of good to the State at large.

The temperature has been exceedingly favorable for both grass and grain—the thermometer in this city marking the high average of 53° for the month of December. The rain has also been general—all over the State—and has fallen so moderately, that the thirsty earth has been able to drink it up to a much greater extent than usual.

It is with unfeigned pleasure, that, in the light of these facts, we look forward to the ensuing year as one of unparalleled productiveness and prosperity. Everybody looks smiling and happy, and the customary salutation of the season, as passed around on Monday last, was no unmeaning word; but was uttered with the almost certainty that we all should indeed be happy.

The miners are also rejoicing in view of the abundance of water for mining purposes. The Territorial *Enterprise* says that even though no more rain or snow should fall for the winter, water would be abundant in that vicinity for a year or two to come—a good store of water being laid up in the hills, all of which are great natural reservoirs.

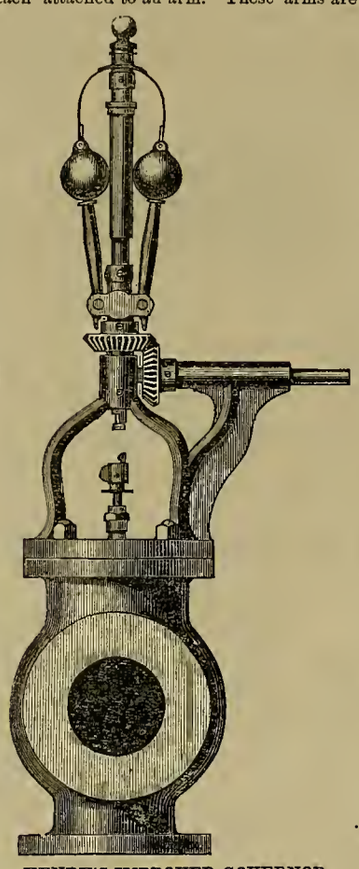
The fall in this city to January 1st has been 20.29 inches. The highest previously noted was in '51 and '52, when 19.31 fell. The fall at other localities is reported as follows:

Sacramento	to Dec.	31	12.42
Stockton	"	31	10.80
San Andreas	"	23	10.89
Turlock (Stanislaus Co.)	"	31	8.52
Los Angeles	"	30	8.21
Shasta	"	26	30.25
Nevada	"	29	36.00

Hendy's Improved Lamont Governor.

A great necessity in any establishment using steam power is a good governor to the engine. The great difficulty with governors has been that they were not sensitive enough to changes of load on engine to prevent too much speed. Beside being very sensitive, a governor should possess the property of being able to stop the engine in case the governor belt breaks or slips its pulley, or any accident happens which would stop the govern from working properly. When this happens the engine frequently "runs away with itself," so to speak, as was the case a short time since with one in Stockton, in which, by some disarrangement the governor, stopped and the fly wheel, by reason of increased speed, broke, a portion going through the roof, and the machinery was damaged to the extent of some $3,000.

By referring to the accompanying cut it will be seen that there are two balls, each attached to an arm. These arms are



HENDY'S IMPROVED GOVERNOR.

pivoted to short cross pieces which are secured so that the revolution of the spindle turns the whole. The arms extend below their fulcrum so that there is no tendency for them to spread too far for the proper opening of the valve, for the lower ends will strike the sleeve and arrest their separation. A hollow pipe passes up through the cross piece and extends into a sort of sleeve which has its upper end closed, and the rod is fastened to the upper end of the sleeve, which is attached to the valve. A spring is curved into an elliptic yoke or any other convenient from and its ends firmly secured to the halls. The central portion of the spring stands considerably higher than the ends, and at this point it is secured to the top of the sleeve or the valve stem.

The operation is as follows: When the engine begins to move the governor rotates and the balls are separated by centrifugal force. This increases the tension or strain on the spring by partially straightening it. Any decrease of speed allows the force of the spring to overcome the centrifugal force, and the balls are drawn nearer together, the valve being correspondingly affected.

There is a small button formed on the lower end of the rod as shown in the cut, that, when it is connected to the catch, raises and lowers the valve by the expansion or contraction of the halls. When the halls come close together by the governor stopping, the catch is drawn up against the sleeve which disconnects it from the upper part of rod allowing the valve to drop, which shuts off the steam. By reversing the catch or turning it half way round it may be attached to the stem so that in shutting down with the throttle valve it will not disconnect.

At the lower end of the rod is a screw working in the valve, which, by turning the catch round will increase or diminish the speed of the engine as desired, without the necessity of stopping the governor. As will be seen from this description, if the governor belt breaks, the balls immediately close, the catch is unfastened, the valve drops and the engine is stopped. Over 200 of these governors have been sold by Mr. J. Hendy, from whom further information may be had by addressing him at 32 Fremont street, in this city.

United States Signal Service.

There being considerable interest at present concerning the Signal Service Corps, some slight sketch of their extended system of meteorological reports, which is so invaluable to agriculture and navigation and the people generally, may be interesting. A short time since the War Department issued a circular for the purpose of giving the public at large some general idea of the workings and object of the Signal Service Corps. The circular is entitled "The Practical Uses of Meteorological Reports and Weather Maps;" and our information is principally derived from its pages.

In pursuance of the duty imposed upon the Secretary of War by the law providing for the announcement by telegraph and signal of the approach and force of storms, and under his direction the office of the Chief Signal Officer of the Army, at the War Department, causes meteorological observations and reports to be made daily and nightly at 62 stations. The Office Division of Telegrams and Reports, for the benefit of commerce, is organized for the preparation, receipt and use of these reports.

At every station three observations are taken daily, at the same moment of actual (not local) time for all stations, by the Observer Sergeants of the Signal Service. The reports are immediately telegraphed to the office of the Chief Signal Officer at Washington.

Use of the Telegraph.

By a carefully arranged system of telegraphic operations, copies of the full reports of all stations thus transmitted to Washington, or of portions of them, are sent at the same time to many of the Signal Service stations in principal cities and towns. At each station so receiving a tabular report, one or more bulletins are published. The observations are made synchronously at the different stations at the exact hours, 7:35 A. M., 4:35 P. M. and 11:35 P. M., Washington time.

Reports.

The full reports from all stations are telegraphed to and received at Washington, translated from cipher and published in the form of bulletins of reports by the hours of 9 A. M., 6 P. M. and 1 A. M. respectively (Washington time). The bulletins wherever published, at Washington or elsewhere, exhibit the following particulars, viz: Hight of barometer; change since last report; thermometer; change in last 24 hours; relative humidity, in per cent.; direction of wind; velocity of wind, in miles per hour; pressure of wind, in pounds per square foot; force of wind, reduced to Beaufort's scale; amount of cloud; rainfall since last report, in inches and hundredths, and state of weather.

Weather Maps and Bulletins.

At the more prominent stations and those in large cities, Weather Maps are posted conspicuously every morning, showing, by means of variable symbols, the morning reports of the different stations. The midnight report is gratuitously furnished to morning newspapers that are published in a city where a station of observation may be, and the morning report is also delivered to the afternoon papers in time for publication.

In addition to these bulletins, a table of Synopses and Probabilities is prepared at the office of the Chief Signal Officer and issued thrice daily, at 1 A. M., 10 A. M. and 7 P. M. A weather map is also issued, showing the condition of the weather in all places which are in communication with the Corps. We shall give to the readers of the PRESS a *fac simile* of one of these maps in a future issue, so that they may be able to judge of their efficiency and completeness.

Instruments Used.

The observations taken three times a day by the observers at their respective stations and telegraphed to Washington, are made by the use of the following instruments: the thermometer for ascertaining the temperature of the atmosphere; the barometer for the weight; the hygrometer for the humidity or amount of moisture; the pluviometer or rain gauge for the amount of rain which has fallen; and the anemometer to tell the velocity of the wind. All these observations are taken simultaneously, and a result is easily reached and predictions made from deductions drawn from the data thus collected at one point.

Utility of the System.

As we remarked in a former issue, the verification of the prediction of the Signal Service Corps by our last storm has caused more general attention to be drawn to its benefits on this coast, although the system has been thoroughly inaugurated throughout the East, and is now in good working order. The maps and bulletins are consulted by merchants, ship owners, farmers, and in fact, by all who are enlightened enough to appreciate them, and have almost become as necessary as town clocks. When the entire system has become thoroughly organized in our part of the country it will be of great advantage to all classes who may be at all interested in meteorological changes.

The science of meteorology is still, so to speak, in its infancy and it cannot therefore be expected that the exactness of more favored sciences can be attained, and until more data and generalizations are procured, the public should make due allowance for any discrepancies which occur between weather prognostics and the weather following. The Chief Signal officer of the army has just issued from his office a small pamphlet, entitled "Cautionary Signals" which fully describes the signals to be employed by his corps of observer sergeants at the various stations and points throughout the country and he says that "aware of the immense difficulty of attaining unerring and uniform accuracy in the display of signals, and anxious to aid the citizens as much as possible in forming a correct estimate of coming changes, great pains are taken to state clearly that wherever a signal is hoisted it is simply *cautionary*, and is only designed to forewarn of probable danger. Disastrous and extensive storms rarely fail to give premonition to every one who carefully observes the daily rise and fall of mercury in the barometer. The cautionary signal, combined with weather reports from which it is deduced, cannot fail to convey to all who are really concerned to know the future weather a necessary warning of the danger that is probably approaching."

Signals.

The signal is a square red flag, with a square center of black for denoting danger by day, and a red lantern to denote danger by night. The official text says that this observance of the cautionary signal calls for frequent examination of local barometers and other instruments, by those interested, and the study of local signs of the weather, as clouds, etc. By this means those who are expert may often be confirmed as to the need of the precaution to which the cautionary signal calls attention or may determine that the danger is overestimated or past.

We will give in a future issue some details in regard to laws already known respecting storms, and will continue to furnish weekly for the benefit of those who are interested in meteorological science, the result of the daily observations of the Signal Service Corps for those particular localities which will be of interest to persons on this coast. Of course these figures will come to our subscribers too late for them to make any satisfactory predictions, but they will be of value as recording the various changes, rainfall, etc., of stations mentioned.

Domestic Economy.

Hard Beds.

The preference for hard beds as being more healthy than soft ones, is worthy only of those who have settled down into a Diogenes-in-the-tub life. It is true a tired person will sleep soundly on a hard bed, and habit may make such a bed acceptable; but whoever has felt the almost human kindliness and warmth of a soft hair mattress, cannot go back to husks and straw without a pang. Let us look at the matter physiologically. The spinal column is composed of 24 pieces of bone fastened together by cartilage, with a little cushion of highly elastic cartilage nicely fitted in between each to prevent friction and permit perfect freedom of movement. The spine is not straight but curves in, as every body knows, at the small of the back and curves out again. In a perfect bed every part of this vertebral column will be supported, but in a hard, unyielding surface this is not possible. One portion of the body rests firmly on the bed beneath it, while another in a line with it receives no support. Sleep on such a bed will not restore the wearied frame nearly so well as repose on an elastic couch where every part of the body is equally supported. We do not recommend softness but *elasticity*.

Feathers, except in very cold weather, are unwholesome, because they retain an excess of warmth about the body, and also because they absorb the insensible perspiration thrown off by the pores, and permit the body to re-absorb the excrementitious matter. A bed of soft, fresh straw, evenly distributed and covered with a thin cotton or woolen mattress, may be a good resting place, and furnish sweet sleep. But how can man or woman rise refreshed from a couch of straw or a shuck mattress which has been in nightly use without renewal for a series of years? Yet there are portions of this very land of plenty where travelers are put to sleep upon just such beds as this.

Every man in grazing districts may own a dozen or two coarse woolen sheep. These and their increase will in a short time give him wool mattresses than which none are more pleasant, more wholesome, or durable. The tag-locks washed and carded should be hoarded by every farmer's wife for this purpose. In cities and villages, and in the more populous parts of our country, those who can afford good sleeping places generally have them. The degree of refinement and cultivation, as well as wealth one has attained, may be easily read by one glance at their sleeping apartment.

How to Cook a Beefsteak.—A beefsteak is always best broiled; but the following method is recommended by a lady writer, when broiling is not convenient:

The frying pan being wiped dry, place it upon the stove and let it become hot. In the meantime the steak—if it chance to be a sirloin so much the better—pepper and salt it, then lay it on the hot, dry pan, which instantly cover as tight as possible. When the raw flesh touches the heated pan, of course it seethes and adheres to it, but in few seconds it be comes loosened and juicy. Every half minute turn the steak; but be careful to keep it as much as possible under cover. When nearly done lay a small piece of butter upon it, and if you want much gravy add a tablespoonful of strong coffee. This makes the most delicious, delicately broiled steak, full of juice, yet retaining the healthy, beef flavor that any John Bull could require. The same method may be applied to mutton chops, or ham, only they require more cooking to prevent them from being rare. An excellent gravy may be made by adding a little cream, thickened by a pinch of flour, into which, when off the fire and partially cool, stir the yolk of an egg well beaten.

Importance of Cookery.—The preparation and cooking of food should receive its proper share of attention, if the greatest amount of benefit is to be derived from its introduction in the system. Blot, the professor of this art, says that green vegetables, such as cabbage, spinach, etc., should be put in boiling water, but dry vegetables, as beans and peas should be put in cold water to cook, after having been previously soaked in lukewarm water. In the case of potatoes, the eyes or germs are to be cut out, and the skin rubbed or scraped off, then steamed or roasted. He thinks that fish, although containing twenty per cent. of nutritious matter, ought to be partaken of at least twice a week, as it contains more phosphorus than any other food, and serves to supply the waste of that substance in the system, and particularly of the brain.

Prevention of Dampness.

Dampness in walls is often a great annoyance to housekeepers, and in moist climates good precautions should be taken to keep it out of the walls and buildings. It may be prevented from rising in brick or stone walls by a thorough application of asphaltum to the upper portion of the foundation, or to several of the lower tiers of bricks. Asphaltum thoroughly applied to the outside of brick work will also prevent the ingress of dampness. The walls may be painted over the asphaltum, if desired.

Another method is also recommended by by a leading scientific paper as follows:—Three-quarters of a pound of mottled soap are to be dissolved with one gallon of boiling water, and the hot solution spread steadily with a flat brush over the outer surface of the brickwork, taking care that it does not lather; this is to be allowed to dry for twenty-four hours, when a solution formed of a quarter of a pound of alum dissolved in two gallons of water is to be applied in a similar manner over the coating of soap. The operation should be performed in dry, settled weather. The soap and alum mutually decompose each other, and form an insoluble varnish which the rain is unable to penetrate, and this cause of dampness is thus effectually removed.

Alum is also a valuable prevention of mildew. Cloths or other fabrics dipped into strong alum water, are proof against mildew, no matter how much they may afterwards be exposed to damps or other causes favoring the growth of this disagreeable fungus.

About a year ago, says a correspondent of the *Journal of Chemistry*, I was filling up a large scrap-book, and in the course of my work used, in connection with a goodly amount of paste, a small quantity that had alum in it. A spell of wet weather coming on before my book was dry, caused it to mildew badly throughout, except where the alum paste had been used; there, no trace of mildew was to be seen. Upon observing this, I began trying various experiments with alum as a mildew preventive, all of which succeeded, though put to the most severe tests. I therefore feel that I have, by the merest accident, made a valuable discovery, and as such I take pleasure in offering it to the public.

The Roast Turkey.—Here is the New England method: Select a fine, plump, yellow-skinned turkey, weighing from ten to twelve pounds. Examine it thoroughly to see that all the pin feathers are taken out; hold it over a blaze to singe any fine hairs that may remain; wash it thoroughly inside and out, and rub it over with salt. Take the gizzard, heart and liver, put them into cold water, and let them boil until tender. When done, chop them very fine. Take stale bread, or the large Boston crackers, and grate or chop them. Add salt, pepper, and some sweet herb, if liked, to the bread crumbs; after which beat up two eggs with which to moisten the crumbs; add and mix thoroughly with this the chopped "inwards," not forgetting to put in salt and butter. Fill the inside of the turkey with the dressing, taking care that the neck and crop is made to look plump, and sew the openings, drawing the skin tightly together. Then rub a little butter over your turkey, and lay it upon the grate of your meat pan. Cover the bottom of the pan well with boiling water. After a half hour baste the turkey by pouring over it the gravy that has begun to form in the pan. Repeat the basting once in about fifteen minutes. In an oven of average temperature a 12-pound turkey will require at least three hours; but every oven has its own way of baking, and the cook must be governed by it.—*Hearth and Home.*

The Roast Goose is to be prepared in the same manner as the turkey. The dressing should be made of mashed potatoes, seasoned with salt, pepper and sage, or onions, if according to the taste of the family. Make giblet sauce by boiling the "inwards" until very tender, chopping them fine, and adding them to a gravy made by using the liquor in which they were boiled, thickened with flour, and to which has been added one ounce of butter, and pepper and salt to suit the taste.—*Hearth and Home.*

Mechanical Hints.

The Use of Screws.—Mechanics generally drive screws into wood without any precaution. But in cabinet and all other fine work, especially, it would be well to use certain precautions which are given as follows in the *Manufacturer and Builder*:—When the wood is very hard, it may ease the labor of getting the screw home when you grease it; and when you expect that the screw will some time have to be taken out, it is well to grease or oil it, to prevent it rusting. Also when the object is exposed to dampness, screws should be protected in this way. When the wood is very soft, or when some strain may cause the screws to work loose, warm them, dip them in melted glue, and also put a few drops of glue in the hole. The latter is useful when in repairing an article it is found that the holes are rather large. If you cannot get other screws large enough to fill the hole, use a wooden plug inserted with glue, and make a new hole in the plug or next to it. If the objects are exposed to dampness, apply powdered resin, the only precaution being to heat the screw sufficiently to melt the resin. If you want the screws to stick so fast that they can not be got out without breaking, put some vinegar or other suitable acid in the hole, which will rust them in.

Colored Cements.—A writer in *Comptes Rendus* states that colored cements which harden rapidly may be made as follows: He takes a solution of silicate of soda (sp. gr., 1,298) and adds to it, while stirring, first pulverized and previously washed, lixiviated chalk, so as to form a thick mass like butter, to which are added, for coloring purposes, the following substances: Finely pulverized sulphuret of antimony for black, iron filings for gray, zinc dust for whitish gray, carbonate of copper for bright green, oxide of chromium for deep green, cobalt blue for blue, red lead for orange, vermillion for bright red, and carmine for a violet blue. This cement hardens within from six to eight hours, and may afterward be polished, becoming like marble.

Alloy of Copper and Cast Iron.—The alloy of equal parts of copper and cast iron, introduced by Soret, is not as well known as it deserves to be. It has the appearance of zinc, is much harder than copper, and tougher than cast iron. In casting it does not adhere to the forms; it does not rust in the air; and it may be used successfully for many parts of machinery, statues, etc. After casting, it may be easily electroplated, or the copper may be exposed by dissolving the iron from the surface with a suitable acid.

The Way to Succeed.

Fortune, success, position are never gained but by piously, determinedly, bravely striking, growing, living to a thing till it is fairly accomplished. In short, you must carry a thing through if you want to be anybody or anything, no matter if it does cost you the pleasure, the society and the thousand pearly gratifications of life. No matter for these. Stick to the thing and carry it through. Believe you were made for the matter, and that no one else can do it. Put forth your whole energies. Be awake, electrify yourself, and go forth to the task. Only once learn to carry through a thing in all its completeness and proportion, and you will become a hero. You will think better of yourself, others will think better of you. The world in its very heart admires the stern and determined doer. It sees in him its best sight, its brightest object, its richest treasure. Drive right along, then, in whatever you undertake, and consider yourself amply sufficient for the deed. You will be successful.

Building Character.—There is a structure which everybody is building, young and old, each one for himself. It is called *character*, and in every act of life is a stone. If day by day we be careful to build our lives with pure, noble, upright deeds, at the end will stand a fair temple, honored by God and man. But, as one leak will sink a ship, and one flaw break a chain, so one mean, dishonorable, untruthful act or word will forever leave its impress and work its influence on our character. Then let the several deeds unite to form a day and one by one the days grow into noble years, and the years, as they slowly pass will raise at last a beautiful edifice, enduring forever to our praise.

We should never throw out against a man broken hints and dark inuendoes, which would leave the hearers to suspect anything and everything that ill-nature can suggest.

The California Powder Works

No. 314 CALIFORNIA STREET,

SAN FRANCISCO.

Manufacturers and have constantly on hand

SPORTING,

MINING,

And BLASTING

POWDER,

Of SUPERIOR QUALITY, FRESH FROM THE MILLS. It being constantly received and transported into the interior, is delivered to the consumer within a few days of the time of its manufacture, and is in every way superior to any other Powder in Market.

We have been awarded successively

Three Gold Medals

By the MECHANICS' INSTITUTE and the STATE AGRICULTURAL SOCIETY for the superiority of our products over all others.

We also call attention to our

HERCULES POWDER,

Which combines all the force of other strong explosive now in use, and the lifting force of the BEST BLASTING POWDER, thus making it vastly superior to any other compound now in use.

A circular containing a full description of this Powder can be obtained on application to our Office.

16v20-3m JOHN F. LOHSE, Secretary.

A Delightful Hiss.—There is the hiss of ridicule, the hiss of scorn, the hiss of snakes in the grass; but the most delightful hiss is that of

Tarrant's Effervescent Seltzer Aperient

In the sparkling goblet, giving assurance to the invalid that his thirst will be deliciously assuaged; that his stomach will be refreshed and purified; that if he is feverish, his body will be cooled by healthful evaporation; that if he is constipated, the difficulty will pass away without a pang, and that if the condition of his general health is impaired, it will be speedily restored. Of course, he will take care to procure none but the genuine.

SOLD BY ALL DRUGGISTS.

AMBLER'S BLOWPIPE FURNACE,

For Roasting Rebellious Ores.

This new roasting furnace is the CHEAPEST AND BEST yet offered to the public. By furnishing an ample supply of oxygen to the ore while roasting, thorough oxydization of the sulphurets is secured at a small cost.

It is Adapted to All Kinds of Ores.

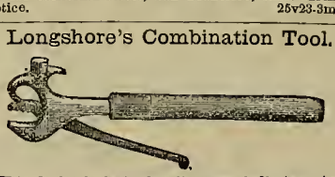
A description and illustration of this Furnace was given in the Scientific Press of November 25th.

For terms, circular, and further information, address the agent of the inventor,

MONROE THOMSON,

At 444 California street, San Francisco, until further notice. 25v23-3m

Longshore's Combination Tool.



This device is just what its name indicates. As a Kitchen Tool it is indispensable. It will fit and lift with perfect safety, any Stove Lid, Frying Pan, Pie Pan, Pot, Kettle, or any other vessel or dish used about a stove. It is a complete tool for stretching carpets, driving tacks, pulling tacks, &c., &c. It answers the double purpose of hammer and pincers, and is also a good Nut Cracker. It is made of the best malleable iron, and the Hammer, Pincers and tack puller, are all hardened so as to stand the roughest usage. An Agent is wanted in every town on the Pacific Coast to sell this valuable little implement. Retail price fifty cents.

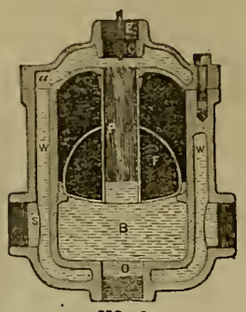
CRAIG & BREVOORT'S
Patent Condenser for Steam
PUMPS, &c.



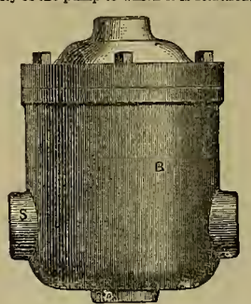
NO. 1.

The annexed engravings represent a Condensor intended to be attached to the ordinary steam pump, thereby bringing it within the class of low pressure, or more properly speaking, of condensing engines; the steam, when it has done its work in the cylinder, instead of being exhausted into the atmosphere, is conducted to the condenser, on its eutry into which, it meeta the water drawn by the pump, and is immodiately condensed.

The Cut No. 1 represents a vertical section of the Condenser, and No. 2 an elevation.

The flange D is bolted to the suction orifice of the pump, and the flange S to the pipe leading to the well, or whatever source of supply the pump may have; W is a water jacket surrounding the main chamber of the condenser, B, and with which the suction pipe, S, communicates, permitting a free circulation of water within the jacket and into the hollow cover or top through the serics of openings, one of which is shown at A, and from thence into the body of Condenser, B, through pipe P, carried hy float F; the pipe P also acts automatically as a valve to enlarge or contract the space through which the water enters it, hy which means the possibility of the condenser being at any time flooded is avoided. The pipe P, it will be observed, also acts as a guide to float F.

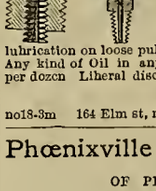
The valve, C, (shown in Cut No. 1), which is raised or lowered hy means of screwed stem—shown coming through elhow in Cut No. 2—is for the purpose of increasing or decreasing the flow of water according to the capacity of the pump to which it is attached.



NO. 2.

The exhaust pipe from steam cylinder is screwed into cover at E; the exhaust steam is thus thrown directly into contact with the water entering the condenser on its way to water cylinder of pump through D. A vacuum being of course immediately formed, acts on the exhaust side of the steam piston, aiding it in its work. If at any time it is desirable to run the pump without the condenser, it is only necessary to turn the three-way cock, which is placed in the exhaust pipe, into such a position as to cause the steam cylinder to exhaust into the atmosphere; when this is done the pump is perfectly free from the condenser, and acts as if it were not attached. This condenser is specially useful for pumps running in mines, or any other position where trouble is experienced in getting rid of the exhaust steam. Address H. L. BREVOORT,
6v23eow1y 128 Broadway, New York City

SELF-OILERS.
WATERS'
SELF-OILERS.



PATENTED October 21, 1862; July 6, 1867; July 23 and Sept. 22, 1868, and June 20, 1869.
Glass reservoir, with white metal coupling cast on.
Substantial brass stem, with graduating plug—V slot on one side, as shown in magnified cut—in the top.
The best and cheapest OILER in the market; perfect lubrication on loose pulleys and all kinds of bearings. Any kind of Oil in any kind of weather. Price, $4.50 per dozen Liberal discount to agents and to the trade.

RAIN TABLE.

We publish below the monthly rainfall at Sacramento, from the year 1849, including 1871. The average rainfall at that point is about 20 inches, and it will be seen from the table that up to Jan. 1st, of this year, within 7¼ inches of this total had fallen. As the mean amount of rainfall for January is 3½ inches, and the maximum 15 inches, we may calculate with a degree of certainty of having more than the average quantity of rain this season.

We give this table that our readers may use it for reference, and will republish it with additions, at some future time.

RAIN TABLE FOR SACRAMENTO.—PREPARED BY DR. T. M. LOGAN.—FOR THE PRESS.

Arranged according to the seasons, showing the amount in inches of each month, during twenty-two years, and for each rainy season, including the present, to January 1st.

MINERS, READ YOUR MINING JOURNAL.—Mr. George Bower, Superintendant of the Bower mine, on the Mokelumne River, as we stated last week, was severely injured the week before, by the explosion of a cartridge which he had placed on a stove to dry. The doctor would have missed a fee and Supt. Bower saved an eye and several fingers, probably, if he had read au article on the proper way to dry these cartridges, in the SCIENTIFIC PRESS of Dec. 9th, 1871. We sympathize, however, with Mr. Bower, or any miner who is suffering from an accident, many of which are of course unavoidable. We advise all our friends in mining communities to read their paper and they will surely be able to glean some information which will be of either immediate or ultimate benefit to them in one way or another.

A MEETING of the Academy of Sciences was held on Tuesday evening, the proceedings of which we will give next week.

WE call the attention of miners generally, to an article on "Salivation," on the 7th page.

METEOROLOGICAL REPORTS.

SAN FRANCISCO.

The following is the meteorological report of the month as computed by Mr. Thomas Tennent of this city:

BAROMETER.—Mean hight at 9 A. M. 30.17; Mean hight at 12 M. 30.16; Mean hight at 3 P. M. 30.14; Mean hight at 6 P. M. 30.13; Greatest hight on the 4th at 9 A. M. 30.42; Least hight on the 21st at 12 M. 29.69.

THERMOMETER.—In the shade and free from reflected heat. Mean hight at 9 A. M. 54; Mean hight at 12 M. 57; Mean hight at 3 P. M. 58; Mean hight at 6 P. M. 56; Greatest hight on the 20th, at 3. P. M. 62; Least hight on the 11th at 9 A. M. 46.

SELF-REGISTERING THERMOMETER.—Mean hight during the night, 42; Greatest hight on the morning of the 19th, 64; Least hight on the morning of the 11th, 33.

RAIN GAUGE.—2d, 0.16 in.; 17th, 0.63 in.; 18th, 3.22 in.; 19th, 3.49 in.; 20th, 0.62 in.; 21st, 0.93 in.; 22d, 0.32 in.; 23d, 3.48 in.; 26th, 0.15 in.; 27th, 0.74 in.; 28th, 0.23 in.; 29th, 1.04 in.; 30th, 0.13 in.; 31st, 1.60 in. Total (during the great storm in December), 16.74 in 14 days. Total for the season, 20.60 in.

WINDS.—North, NE and NW on 12 days; South and SE on 17 days; West on 2 days.

WEATHER.—Cloudy on 18 days; variable on 8 days; clear on 5 days.

STOCKTON.

[Reported by G. A. SHURTLEFF, M. D., Superintendent State Insane Asylum.]

NOTE.—1857 to 1866 inclusive, not taken.

The above has been sent us by solicitation, in order that the readers of the PRESS may compare the rainfall of Stockton with that of other points. It is reported to precisely 12 P. M., December 31st, 1871.

SACRAMENTO.

[By T. M. LOGAN, M. D., Secretary State Board of Health.

Dec. 25, 1871. Rainfall for the season to date..9.050 inches
" 31, " " " " .....3.371 "

Total for the season up to Jan 1, 1872.....12.421 inches.

REMARKS.—The average annual rainfall at Sacramento, is about twenty inches. It will be seen from the above statement that we have received within seven and one-half inches of this total, as the mean amount of rainfall for January is three and one-half inches, and the maximum for this month fifteen inches, we may calculate with a degree of certainty of having more than the average quantity of rain this season.

CENTERVILLE.

Amount of rainfall at Centerville from December 15th, 1871, to January 3d, 1872.

Aid to Inventors.

EDITORS PRESS:—The *Manufacturer and Builder* mentions a very useful institution now being organized in New York. San Francisco would, I believe, derive equal benefits from similar associations. It is designed to assist inventors, by giving them a place and the use of tools. There will be committees, to whom inventors may refer their ideas or their models. If the report be favorable, the Society will, in consideration of an interest in the patent rights, advance means to develop them. There will be lectnrers and artists skilled in drawing designs and making models; workshops and other apartments, with conveniences for the use of inventors.

The aim will be to enlist all mechanics in the scheme, and to hold regular exhibitions, having the character of Fairs.

This movement has its origin in the widespread dissatisfaction given by the awards of the last Fair of the American Institute.

There is, in the climate of California, something that stimulates invention; but, between high rents, dear money and expensive steam power, inventors find unusual obstacles to the exploitation of new conceptions. We know no institution which would be of more profit to the State, considering its cost, than an inventors' aid association; and I believe there would be little difficulty in getting up such an organization. D. R.

Real inventors are often poor and modest, and need cash assistance. Suoh men, however, know the merits of their inventions better than committeemen. If liberal and honest men in this city will devote sufficient money and time for the organization and perpetuation of such an association, we hope to see it established. Several small associations with a similar object, however, have been attempted here and failed. One, in 1869, was termed the S. F. Inventors' Association. We shall look with interest for and report any success this New York organization meets with.

SCRIBNER'S MONTHLY.—The January numher is a rare publication, and its numerous engravings are finely executed. The publishers apparently aim to raise the reputation of American magazines for beautifnl wood engravings, in which effort they are eminently successful. Printed on superior paper with artful impressions, pleasing and attractive delineations form pictures indelible in the memories of the most cultivated readers. Scribner's views of the Yellowstone, in volume second, and Yosemite in the present numher we have never seen excelled. No one will he disappointed who rcads this new and first class monthly. We append a snmmary of the table of eontents for January:

The Orphan's Christmas-Tree — Poem—Illustrated; The Wonders of the West—No. 1; The Big Trees and the Yosemite—Illustratcd; Song—Poem; A Christmas Carol—Poem—Illustrated; Stephen Skarridge's Christmas—Illustrated; A Christmas Symphony—Poem—Illnstrated; The Last Man of Mexican Camp; The two Mrs. Scndamores—Concluded; Christmas—Poem; Hunting Adventures in India—Illustrated; The Oak Tree's Christmas Gift; The Great Sea-Serpent; A Day of Scottish Games; Some Kinds of Spiritual Qnackery; Wilfrid Cnmhermede; Assault of Antinous upon Ulysses; At His Gates—Chapters I.-III—Illustrated; Topics of the Time; The Old Cahinet; Home and Society; Culture and Progress Abroad; Culture and Progress at Home; Etchings—Christmas in Ole Virginny.

Published by Chas. Scribner, 654 Broadway, $4 per annum. Bound volumes from its commencement, Jnly 1, 1870, can he obtained, and will he highly prized by those who desire an excellent magazine.

A Valuable Work.

The Explorers', Miners' and Metallurgists' Companion, by J. S. Phillips, M. E., recently published by DEWEY & CO., San Francisco, is a work which will commend itself to the public, not only for the completeness and clearness of the information it supplies, but for the practical assistance it affords to men not scientifically educated, to do their own assaying. It is a handsome volume of 640 pages with 81 engravings. The work is divided into five sections, treating severally of Geology and Mineralogy, Explorations, Assaying and Discriminations, Mining and Engineering, and Metallurgy. We know of no work on these subjects in the English language at once so comprehensive, practical and intelligible.—*Golden Era, Dec. 17th.*

UNIVERSITY OF CALIFORNIA.—The Preparatory Department is under the charge of five Professors of the University, and six tutors.

Besides the studies of the public schools, Algebra, Geometry, Latin, Greek, German, French, Spanish and Book-Keeping are taught.

Terms: Board and tuition, 4 weeks, $30. Students received at any time. GEORGE TAIT, Oakland, Master Fifth Class. se9bptf

$5 TO $20 PER DAY AND NO RISK.—Do you want a situation as salesman at or near home to introduce our new 7-strand White Wire Clothes Lines, to last forever. Don't miss this chance. Sample Free. Address Hudson River Wire Works, 75 William street, N. Y., or 1 Dearborn street, Chicago, Ill. 23v1-12mbp

LADIES DESIRING TO PROCURE A FIRST-CLASS SEWING Machine against easy monthly installments may apply to No. 294 Bowery, 157 E. 26th, 477 9th Ave., New York Good work at high prices if desired. 21v1-12mbp

A TEA CULTURIST wants a situation. Zamba, a young Japanese, now stopping at 614 Pine street, San Francisco. Can also do ornamental hair work.

CONTINENTAL Life Insurance Co., 302 Montgomery street, corner of Pine.

Our Agents.

M. B. STARR—Pacific Coast.
A. C. KNOX, Oity Soliciting and Collecting Agent.

Mining Companies

Should advertise their Meetings, Assessments, and Sales, in the SCIENTIFIC PRESS. Rates more than one-half less than daily publications. Stockholders should take the hint and request their managers to truly economize by advertising in a MINING JOURNAL, where all noticemay be seen by cheaply purchasing and examining a weekly. You will thus save money and uphold a journal which upholds your intereste.

FOR 25 CENTS we will send, postpaid, four sample copies (recent numbers) of the PRESS. This, we believe, will induce many to subscribe who have not yet read our paper. It is a cheap and valuable favor to send a friend anywhere.

MARAVILLA COCOA.—No breakfast table is complete without this delicious heverage. The *Globe* says: "Various importers and manufacturers have attempted to attain a reputation for their prepared Cocoas, but we doubt whether any thorough success had been achieved until Messrs. Taylor Brothers discovered the extraordinary qualities of 'Maravilla' Cocoa. Adapting their perfect system of preparation to this finest of all species of the Theobroma, they have produced an article which supercedes every other Cocoa in the market. Entire solubility, a delicate aroma and a rare concentration of the purest elements of nutrition, distinguish the Maravilla Cocoa above all others. For homœopaths and invalids we could not recommend a more agreeable or valuable heverage." Sold in packets only by all Grocers, of whom also may be had Taylor Brothers, Original Homœopathic Cocoa and Soluble Chocolate Steam Mills—Brick Lane, London. Export Chicory Mills, Brugee, Belgium. fe25-1y

The Fruits and Fruit Trees of America, or the Culture, Propagation, and Management, in the Garden and Orchard, of Fruit Trees generally, with descriptions of all the finest varieties of Fruit, Native and Foreign, cultivated in this country. Mining and Other Companies.

Owing to the time necessary to mail the present large edition of the Scientific Press we are obliged to go to press on Thursday evening—which is the very latest hour we can receive advertisements.

Alhambra Hill Mining Company—Location of works, Alhambra Hill, Pinto District, White Pine County, Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the 9th day of December, 1871, an assessment (No. 1) of 50 cents per share was levied upon the capital stock of said company, payable in United States gold coin, on the 13th day of December, 1871, to Henry G. Langley, 612 Clay street, San Francisco, California. Any stock upon which said assessment shall remain unpaid on the 13th day of January, 1872, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the 5th day of February, 1872, to pay the delinquent assessment, together with costs of advertising and expenses of sale. HENRY G. LANGLEY, Secretary.
Office, No. 612 Clay street, San Francisco, Cal. de16

Eagle Quicksilver Mining Company—Location of mines, Eagle Mining District, Santa Barbara County, California.

NOTICE.—There are delinquent upon the shares of the following named persons, on account of assessment levied on the 30th day of October, 1871, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. Certificate.	No. shares.	Amount.
Bush, A F.....unissued		1	$40 00
Hawley, E R.....unissued		1	40 00
Pioche, F L A.....unissued		2	80 00
Pearson, H H.....unissued		1	40 00
Sinclair, Peter.....unissued		1	40 00
Williams, Mrs Sarah unissued		1	40 00
Townsend, Jas B...unissued		2	80 00

And in accordance with law, and the articles of agreement of said company, and an order of the Board of Trustees thereof, made on the 30th day of October, 1871, the whole or such undivided part of each delinquent share in said mines as may be necessary to pay said assessment upon each, will be sold to the highest bidder at public auction, for cash, in United States gold coin, at the office of the company, Room 5, No. 302 Montgomery street, San Francisco, California, on Monday, the 8th day of January, 1872, at the hour of 2 o'clock, P. M. of said day, to pay the said delinquent assessment thereon, together with costs of advertising and expenses of sale.

WM. H WATSON, Secretary.
Office, Room 5, No. 302 Montgomery street, San Francisco, California. jan6-1t

Kincaid Flat Mining Company—Location of works, Tuolumne County, State of California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 11th day of December, 1871, an assessment of two dollars and fifty cents ($2.50) per share was levied upon the capital stock of said company, payable immediately, in United States gold coin, to the Sec'y, at his office, No. 220 Clay street, San Francisco, Cal. Any stock upon which said assessment shall remain unpaid on Wednesday, the 17th day of January, 1872, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Wednesday, the 7th day of February, 1872, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees. R. H. CORNELL, Secretary.
Office, 220 Clay street, San Francisco. de16-4w

Nevada Consolidated Borax Company—Location of works, Columbus and Fish Lake Valleys, Esmeralda county, Nevada.

Notice is hereby given, that at a meeting of the Trustees of the above named company, held November, 29th, 1871, an assessment of five(5)cents per share was levied on the capital stock of said company, payable on and after the 30th day of November, 1871, in U. S. gold coin, to the Secretary, at the office of the company, No. 420 Montgomery street, San Francisco. Any stock upon which said assessment shall remain unpaid on Wednesday, January 10th, 1872, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold at public auction on Monday, January 29th, 1872, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

J. L. SANFORD, Secretary.
Office—Room 1, 3d story, No. 420 Montgomery street, San Francisco, California.
San Francisco, December 6th, 1871. d9-5t.

Pocahontas Gold Mining Company—Location of works, Mud Springs, El Dorado County, State of California.

Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the 29th day of November, 1871, an assessment of Five Dollars per share was levied upon the capital stock of said company, payable immediately, in United States gold and silver coin, to the Secretary, at the office of the company, Room No. 26, Hayward's Building, No. 419 California street, San Francisco, California. Any stock upon which said assessment shall remain unpaid on Saturday, the 6th day of January, 1872, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before will be sold on Tuesday, the 30th day of January, 1872, to pay the delinquent assessment thereon, together with costs of advertising and expenses of the sale. By order of the Board of Trustees. D. A. JENNINGS, Secretary.
Office, Room No. 26, Hayward's Building, 419 California street, San Francisco, Cal. de2-5w

Quail Hill Mining and Water Company—Location of works, Salt Springs Valley, Calaveras County, Cal.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 19th day of December, 1871, an assessment of Five Dollars per share was levied upon the capital stock of said company, payable immediately, in United States gold coin, to the Secretary, 409 California street (up stairs), San Francisco, Cal. Any stock upon which said assessment shall remain unpaid on the 23d day of January, 1872, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Tuesday, the 13th day of February, 1872, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

T. F. CRONISE, Secretary.
Office, 409 California street, San Francisco, Cal. d23-4w

Silver Wave Mining Company—Location of works, White Pine Mining District, White Pine county, Nevada.

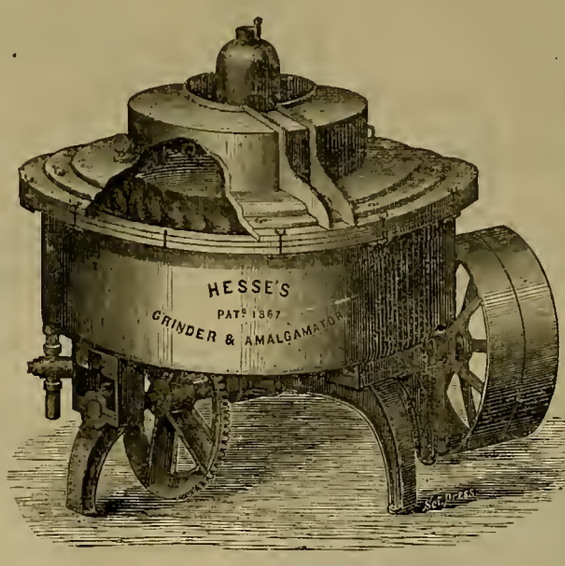
Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 9th day of December, 1871, an assessment of Three Dollars per share was levied upon the capital stock of said Company, payable immediately, in United States gold coin, to the Secretary, at the Company's office. Any stock upon which said assessment shall remain unpaid on Thursday, the 25th day of January, 1872, shall be deemed delinquent, and will be duly advertised for sale, at public auction, and unless payment shall be made before, will be sold on Friday, the 23d day of February, 1872, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees. J.W. CLARK, Secretary
Office, 418 California St. San Francisco. De30-4w.

Tecumseh Gold, Silver and Copper Mining Company.—Location of works, Gopher District, Calaveras County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 5th day of December, 1871, an assessment of Three ($3) dollars per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, F. J Herrmann, at the office of the company, No. 516 Kearny street, San Francisco, California. Any stock upon which said assessment shall remain unpaid on the 9th day of January, 1872, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Tuesday, the 30th day of January, 1872, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

F. J. HERRMANN, Secretary.
Office 516 Kearny street d9td.

THE HESSE GRINDER AND AMALGAMATOR.



This machine is the most complete and desirable grinder and amalgamator now in use. Owners of Quartz Mills and Sulphuret Works will find it greatly to their interests to use this machine. The following are some of its many advantages, viz: The comparatively little power required to run it; the small wear of metal in comparison with other grinders; the large amount of work that may be accomplished in a given time, being about three times the amount usually performed in ordinary pans; the continuous working process, whereby the labor of handling the ore is avoided; the peculiar arrangements and action of the currents in the machine, whereby all the particles of ore are brought in contact with amalgamating surfaces, and are discharged as soon as ground to the required degree of fineness, thus saving an unnecessary waste of power and metal.

IN THE REDUCTION OF SULPHURET ORES,

this machine is especially valuable, the particles are ground exceedingly fine and uniformly sized, which greatly facilitates the concentration of the sulphurets, and leaves them in the best condition for roasting. The Hesse machines are successfully working in several important quartz mills and sulphuret works in this State. For further particulars send for Circular, or apply to

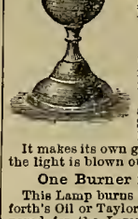
THE CALIFORNIA Safety Gas Lamp.



This New Gas Lamp takes the place of the Candle, the Coal Oil Lamp and Coal Gas, and costs only

One-Half Cent per Hour.

Any person who will take the trouble to examine this Lamp carefully, will see that it WILL NOT EXPLODE.

The flame is as white and brilliant as coal gas, and produces neither Smoke nor Smell. No CHIMNEY IS REQUIRED.

It makes its own gas as fast as it is required, and when the light is blown out the gas ceases to be generated.

One Burner is Equal to Six Candles.

This Lamp burns Refined Petroleum, Gasoline, Danforth's Oil or Taylor's Safety Fluid. Oil expressly prepared for the Lamp furnished by the undersigned in quantities to suit. WIESTER & CO.,
17 New Montgomery street, Grand Hotel, S. F.

BETTS'S CAPSULE PATENTS.

To prevent INFRINGEMENTS, NOTICE IS HEREBY GIVEN, that BETTS'S NAME is ON EVERY CAPSULE he makes for the principal merchants in England and France, thus enabling vendor, purchaser, and consumer not only to identify the genuineness of the Capsule, but likewise the contents of the vessel to which it is applied. The Lord Chancellor, in his judgment, said that the Capsules are not used merely for the purpose of the ornament, but that they are serviceable in protecting the wine from injury, and insuring its genuineness.

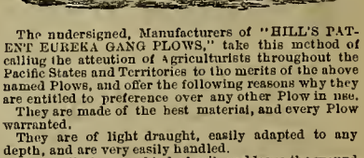
24v23-tf JOHN TAYLOR & CO.

HILL'S PATENT EUREKA GANG PLOW,



The undersigned, Manufacturers of "HILL'S PATENT EUREKA GANG PLOWS," take this method of calling the attention of Agriculturists throughout the Pacific States and Territories to the merits of the above named Plows, and offer the following reasons why they are entitled to preference over any other Plow in use.

They are made of the best material, and every Plow warranted.

They are of light draught, easily adapted to any depth, and are very easily handled.

They will plow any kind of soil, and leave the ground in perfect order.

FIRST PREMIUMS!

These Plows took the First Premium at the State Fair in Sacramento, in 1870; at the Northern District Fair in Marysville, 1870 and 1871; and at the Upper Sacramento Valley Fair, Chico, 1870 and 1871. At the Mechanics' Fair, held in San Francisco in 1871, a Silver Medal was awarded these Plows; and the State Agricultural Society, at the last Fair, offered a premium of $40 for the best Gang Plow. The committee was composed of practical farmers from the agricultural counties, who, after a fair test and thorough competition with the leading plows of the State, awarded the premium to the Eureka Gang Plow. From this it will be seen that these celebrated plows still maintain their reputation over all competitors. Patented Sept. 7, 1869.

Champion Deep-Tilling Stubble Plow,

which took the First Premium over all competitors at the State Fair, 1871. It turns a furrow 14 inches deep and 24 inches wide.

This Gang Plow combines durability with cheapness, being made entirely of iron by experienced workmen, of the best material. Over three hundred are now in use, and all have given entire satisfaction.

Manufactured and for sale at the corner of Third street and Virgin Alley, Marysville, by

HILL & KNAUGH.

And also by most leading Agricultural Dealers in the State. All others are invited to apply at once for Circulars, prices, etc. 16v23-tf

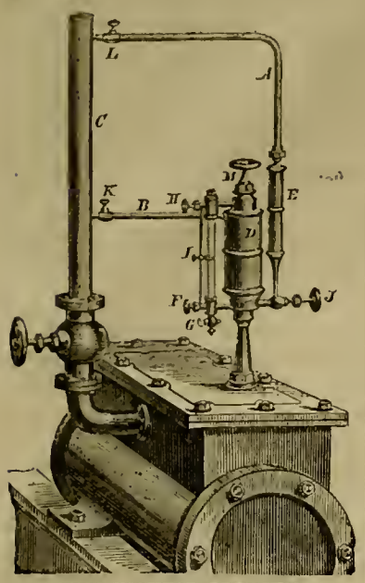
N. Seibert's Eureka Lubricators.



THE HIGHEST PREMIUM

Awarded by the Mechanics' Institute Fair, San Francisco, and State Fair, Sacramento, 1871.

These Lubricators are acknowledged by all engineers to be superior to any they have ever used; feed constantly by pressure of condensed water, supplied by pipe A, regulated under the oil by valve J, and forced out through check valve and pipe B into the steam pipe C; it t en becomes greasy steam, passes to all the valves and cylinder at every stroke of the engine; glass tube I indicates amount used per hour. Packing on rod and stems lasts longer, and the rings on the piston will not corrode. One pint of oil will last from three to six days, according to speed and size of engine; I, sliding gauge; K, valve to shut off when engine stopps; H, F, valves to shut off in case of frost; steam does not enter the cup; it is always cool; warranted to give satisfaction. Patented February 14, 1871. Manufactured by California Brass Works, 125 First street, S. F. 24v23tf

Varney's Patent Amalgamator.

These Machines Stand Unrivaled.

For rapidity pulverizing and amalgamating ores, they have no equal. No effort has been, or will be spared, to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the apperture and between the grinding surfaces.—Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Setlers made on the same principle excel all others They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill-men are invited to examine these pans and setlers for themselves, at the office, 229 Fremont Street, San Francisco.

The Scientific Press for 1872 Still Marching Onward!

Our careful system of compiling, judiciously condensing, and conveniently arranging into regular departments, has been heartily endorsed. It renders the paper worth more to readers, who can find handily that which interests them most. This plan will be continued in Volume XXIV.

The weekly issues of the PRESS will contain reliable

Information for Practical Miners,

Treating on the Opening of Mines; Mining of Ores; Milling of Ores; Smelting of Ores; Separation and Roasting of Ores; Amalgamation; Saving of Gold and all precious Metals; New Processes of Metallurgy; New Discoveries of Mines; Mining Engineering and Hydraulics.

For Inventors, Mechanics and Manufacturers.

All new and important developments in Scientific and Mechanical Progress; Patents and Inventions of the Pacific States; Progress of Home Industries; Hints for Local Manufacturers; Illustrations of New Machinery; Reports of Popular Scientific and Industrial Lectures.

Our Mining Summary

Gives the progress of mining work from week to week in the various counties and districts throughout the principal mining regions of the United States, arranged in alphabetical order. It is the most extensive record of mining operations published in the world. It affords the intelligent miner a rare opportunity to know and profit by the work and experience of his neighbors. Miners have few sources of practical information in their calling, and should embrace every reliable means for improvement. Mining Operators and Shareholders, at home and abroad, weekly examine our Summary with increased interest and profit.

For Self-Improvement,

Every issue of the PRESS abounds with articles of an elevating character, to stimulate the higher virtues and natures and progressive intellects of both men and women.

Our "Domestic Economy"

Embraces new and important facts which should be known in every cabin and household. Short and interesting—the articles under this heading are freely read and practiced with profit and improvement to the readers.

The PRESS is not strictly a "paper for professional, scientific men," but rather a

Liberal and Popular Scientific Journal,

Well calculated to make practically scientific men from our intelligent masses. This is our stronghold for accomplishing good. Plain, correct and pleasing language, easily comprehended by all, confined mostly to short articles, is our endeavor.

The New and Novel Developments

In the progress of this comparatively new section of the Union, but recently settled and now rapidly increasing with a population of the most intelligent and venturesome people, attracted from nearly every quarter and clime on the globe, enable us, with due enterprise, to display vigor and freshness in our columns not met with in similar journals elsewhere. The same circumstances also render such a paper more especially valuable to its readers in a new, and to a certain measure, untried field, where the best methods and processes of industry are not so well established or traditionally known as in older communities. Published experiences often save costly experiments and disastrous results.

Hundreds of Dollars

Are oftentimes saved to the readers of this paper by a single hint or article of information in its columns; such instances have been repeatedly reported to the editors and proprietors during their long connection with the PRESS. Our paper presents

A Great Variety of Industrial Information,

In brief and fresh form, suited to the wants and tastes of the readers of this coast, which is not obtainable otherwise so timely, or in so cheap and convenient form. As an industrial publication, meeting the wants of so many kindred industries, this journal stands preeminent and without a precedent.

Our community is not so numerous or our field so thickly settled as the Eastern States and Europe, consequently we wish each friend of our enterprise to bear in mind the greater importance of his individual patronage, and also the value of

Speaking a Good Word

For the SCIENTIFIC PRESS to those who are not, by personal acquaintance, familiar with its more than ordinary value and merits.

No intelligent reader will regret sending his subscription without delay. A trial is not expensive.

Subscriptions, payable in advance—$4 per annum. Single copies, post-paid, 10 cents. Address

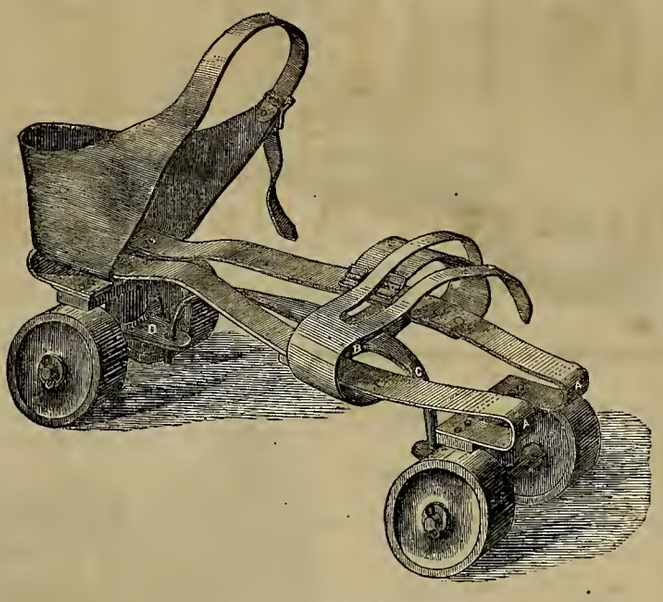
THE C-SPRING ROLLER SKATE,

PATENTED 1871.



Rights and Skates for Sale.

This superior Skate is now beginning to attract the attention of Rink Owners, it being the only Cramping Skate now before the public (except the Plympton Skate) that can run without infringing a former patent.

This Skate is Positively no Infringement

of anybody's patent. It is made in the most substantial and workmanlike manner, and possesses the following points of merit: Beauty, Elasticity, Ease of Movement, Strength, Lightness, and does not injure the skating floor as much as the ordinary skate.

Every pair Warranted to be just what it is represented. Parties intending to

START A RINK,

Should examine and test this Skate. Samples pairs sent C. O. D. on application.

☞ For City, County or Rink Rights, call on or address **WIESTER & CO.,**

21v23-tf No. 17 New Montgomery street (under Grand Hotel), SAN FRANCISCO.

THE GIANT POWDER COMPANY

Are now manufacturing besides the famous regular

GIANT POWDER, A NO. 2 GIANT POWDER,

Somewhat slower in its Explosion, which we recommend for

BANK BLASTING, COAL MINES,

AND FOR ALL SUCH WORK WHERE THE ROCK IS NOT VERY HARD

It is fully as safe as the other and evolves neither smoke nor noxious fumes when exploded.

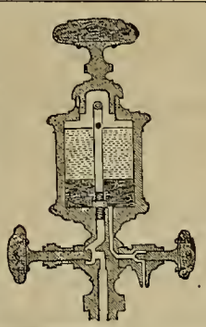
Price. 50 Cents per Pound.

The sales of both grades increase very fast, which is the best proof of their superiority over other explosives.

BANDMANN, NIELSEN & CO.,

20v22-3m16p General Agents, No. 210 Front Street.

STEAM CYLINDER LUBRICATOR.



NATHAN & DREYFUS'

PATENT SELF-OILERS

And Cylinder Cups

Save from 75 to 95 per cent. of Oil. No better investment for the amount can be made by any person having machinery or running shafting. They are so well known as to need no description. All the trouble of "oiling up" is avoided. There is no waste of oil, and no cans are needed. A single trial will prove their value.

We will put them into any mill, and if not perfectly satisfactory, they may be returned at our expense, and the price will be refunded. We have a large stock on hand, of all sizes, adapted to all descriptions of boxes.

Send for Price List and Circular.

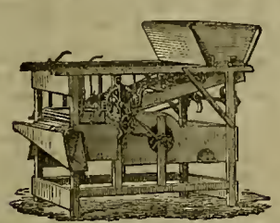
VOLUME XXIV. Number 2.

Freeman's Grain Separator.

The accompanying illustration represents Freeman's improved grain separator, which belongs to a class of machinery in which our local mechanics excel Eastern manufacturers in producing for this Coast. It is intended for farmers and warehouse use, and will be found especially useful to the latter in cleaning seed grain. The grain is fed into the hopper and passes over a wire sieve to which is imparted a peculiar tossing motion and at the same time moves forward and back rapidly. It then drops on to the perforated zinc plates of which screens there are three, and while dropping through, a blast of air from the fan below, blows off the chaff and other impurities. These plates may be lowered by thumb-screws so as to stand at any desired incline. They have a lateral shaking motion so as to facilitate the passage of the grain through the holes.

The cheat and other deleterious substances drop through the sieve into the cheat box below and the cleaned grain into



Freeman's Grain Separator.

its proper receptacle. The different boxes have separate outlets and are so arranged that the contents may easily be sacked without the necessity of anything falling on the floor. The machine is run by hand and can be easily moved from place to place. It will be found especially useful in cleaning grain of the *Silene Gallica*, or French catch fly, a sort of pod which troubles the farmers in many parts of California.

The screen may be removed and attached to any threshing machine, doing away with the chaffing screen and performing the work at one operation. There are three sets of zinc plates and screens for different kinds of grains and they can be changed in a few moments without trouble. This improvement is the invention of a practical man and one who has had great experience with threshers. Right of use may be had by applying to W. H. Freeman, Tomales, Marin county, Cal., who will also give further information to those desiring it.

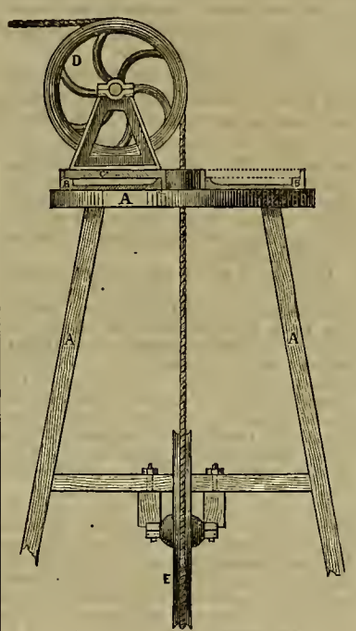
NEW DAM PROJECT.—Certain parties contemplate purchasing Bear Valley of its present owners, says the Grass Valley *Republican*, and constructing a dam 50 or 60 feet high at the lower end. Such a dam would overflow several hundred acres and furnish a large amount of water for mining purposes. Bear Valley is about 4,000 feet above sea level. Water from the valley could be taken to the mines at Dutch Flat, Little York, Quaker Hill, or even down the Washington Ridge to Omega, or Nevada City.

Hoisting Works of the Eberhardt & Aurora Co.

In the issue of the SCIENTIFIC PRESS of Dec. 23, 1871, we gave a discription of the mines of the Eberhardt & Aurora Co., in the illustration of which several shafts were shown, and promised at that time to give a view of the manner in which the hoisting was done so that only one engine was required for hoisting from the entire number of shafts. Our special correspondent, Mr. Murray, obtained for us at the time of his visit a sketch of the gear from which our engravings were made.

The arrangement consists of a pulley mounted upon a turn-table on a suitable frame, so that it can be turned upon a

Fig. I.



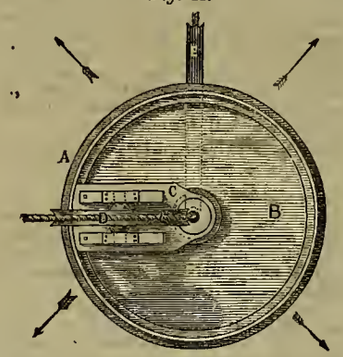
Hoisting Apparatus.

swivel to face in any desired direction. The rope passes round a drum which is revolved by the engine and passes under the pulley marked *E* in Fig..1.. *A*, *A*, *A*, is the frame work for supporting the turn-table and pulley, and is made stationary also; the rope passing under it and up through the centre of the turn-table over the pulley, *D*. *B* represents the turn-table upon which the pulley, *D*, is supported in a frame-work so as to be carried around by the revolution of the turn-table in order to face it in the desired direction. The plate or turn-table, *B*, is made of the best of iron and is three feet and one inch from rim to rim. The outside rim is half an inch thick and the groove is 1½ inches wide. The rope comes up through the center of the turn-table and passes over the pulley, as shown. *E* shows the manner in which the rope may come from the drum and passing up through the hole over the pulley, *D*, transmit the power in a direction at right angles. The arrows indicate the direction to the various shafts that can be operated by the hoisting gear.

A stationary frame with a pulley over which the rope passes is placed over each of the ore shafts; this is raised enough to bring the level of the rope on a line with the revolving pulley, *D*. When it is necessary to hoist from any particular shaft, the rope is detached from the bucket, the end taken to the proper shaft, passed over the pulley and the revolving pulley regulated so as to point in that direction, and it is ready for use. The contrivance is said to give general satisfaction and answer all the requirements.

In this mine there is a very large deposit of ore and several shafts are necessary in consequence; this ingenious arrangement has been contrived so as to re-

Fig. II.



remove the necessity of a hoisting engine at each shaft. The mountain on which the mines are situated is a very high one and there is a great scarcity of wood, what is used being carried up on mules' backs, making it expensive. The water used for the engine, which is of 20-horse power, is obtained from the White Pine Water Co., by whom it is forced to the top of the hill.

The Paul Process.

We have from time to time called the attention of the mining community to this radically new system for the working of ores. We say radically new, as while other modes gather the precious metals by wet amalgamation, this is by electro-galvanic dry amalgamation. Connected with this process is also a new plan of pulverization of the quartz, which is done by a self-feeding and self-discharging pulverizing barrel whereby quartz is made to reduce quartz, thus turning all wear and tear of pulverization to a profit, instead of a tax.

We are informed that the new six-ton mill recently erected at Dun Glen, Nev., by Messrs. Sprague & Co., and where this process and machinery is in practical operation has demonstrated the process to be all Mr. Paul has claimed for it. We have been shown some of the ore as first reduced and passed through a No. 10 wire cloth; also the pulverized ore, and the pulverized amalgamated ore containing 20 per cent. of mercury, without a particle being perceptible to the naked eye, so finely disseminated is it through the ore, and lastly, a bottle containing gold as amalgamated, which is infinitesimal in fineness, that we are satisfied cannot be collected by water in motion. We have also seen a bar of gold worth several hundred dollars, one of several already extracted, and which is estimated at .980 fine.

There is one thing in connection with this process which seems to be of peculiar value, and that is no base substances such as lead, zinc, antimony, copper or arsenic appear to enter into combination with the precious metal or vitiate the mercury. To use Mr. Paul's expression:—"They are placed in antagonism during the process of amalgamation, the mercury having an affinity only for the precious metal."

We are glad to know that Mr. Paul, after so many years of labor to develop this system, is likely to be amply rewarded, and the great interest of mining on this coast to be also substantially benefitted. We shall keep our readers posted on the process as substantial and reliable data presents itself.

Academy of Sciences.

The Academy of Sciences held their regular meeting on Tuesday evening, Jan. 2d; 24 members present. Professor Ehrenberg and Professor Darwin were elected honorary members. The President stated that according to the revised constitution the Trustees were empowered to propose annually the names of two ordinary members for life membership in consideration of important services rendered the Academy. The names of H. G. Bloomer and W. G. Hartford were proposed to be acted upon at the next meeting.

In accordance with the usual custom, President Blake read an interesting address, reviewing the condition of the Academy, speaking of its prospects, and commenting forcibly on the general advantage of the diffusion of scientific knowledge. He spoke of what science had done and what it will do, made some interesting remarks on science being necessary to health; the need of scientific teachers; the natural advantages of San Francisco for scientific study; the scientific education of women, and closed his address with some reference to the State Geological Survey.

Mr. H. G. Bloomer, the curator of the Museum, read his annual report, showing a growth of both the cabinet and library. Mr. H. G. Hanks also presented his report as curator of minerals, etc. The Treasurer, Mr. Elisha Brooks, showed by his annual report that the total receipts were $1,279.35; disbursements, $1,166.50; balance on hand, $112.85.

The result of the election of officers for the ensuing year, was as follows: President, Prof. George Davidson; Vice President, Dr. John Hewston; Recording Secretary, Dr. George Hewston; Corresponding Secretary, Henry G. Hanks; Treasurer, Elisha Brooks; Director of Museum, H. G. Bloomer; Librarian, C. M. Ellinwood; Trustees: Dr. C. M. Hitchcock, Dr. James Blake, Gen. John Hewston and Gen. David Colton.

CORRESPONDENCE.

Mill and Mining in Plumas Co.

EDITORS PRESS:—The recent heavy rains coming as they did upon a considerable body of snow, ensures plenty of water for mining operations during the next twelve months, and indeed gives to mining matters generally in this county a more favorable aspect than for many years past.

During the past two years some very important discoveries have been made in various portions of the county, both in the way of quartz and placer mines, but have lacked development in a great measure for the want of water.

Mills.

A number of new quartz mills have been, and are being erected, and will be ready to commence operations with the opening of spring. At the Indian Valley mine, recently purchased by Messrs. Applegarth and Drake, of San Francisco, a thirty-two stamp mill is being erected which will be ready for work in a few months. Of the old twelve-stamp mill, six stamps are now running, the rock yielding an average of about $15 per ton. I learn that the new proprietors purpose to push operations rapidly, and to thoroughly prospect and develop the mine during the coming year. The

Greenville Mining Co.

Are at work upon rock from the Union ledge located near to, and supposed to be an extension of the Indian Valley ledge. This company have a twelve-stamp mill running upon rock paying from $15 to $28 per ton. Mr. H. C. Bidwell, the Supt., informs me that upon the completion of the new tunnel, now being run at a depth of 460 feet, the mill will be removed to a point very near the mouth of the tunnel, the only trouble now being the expense of hauling the rock over a mile from the mine to the mill. At

Round Valley

The new mill of J. D. Compton is crushing some twenty tons of rock per day, the returns being from $15 to $18 per ton. This mill, although of only six stamp capacity is one of the new patents, being a double battery with a double discharging apparatus, and crushes as much rock as the ordinary twelve-stamp mill.

Mr. H. Gregg is running the old Batchelder mill on rock taken from the Grass ledge, but with what result I did not learn. The

Crescent

Mill has been idle for some months, only the pumps are kept running to keep the water out of the mines. The Supt., Capt. Brentford, informs me that the mine has been sold to a company of English capitalists, who are now on their way out to commence operations. The Crescent has proved itself to be one of the richest gold-bearing ledges in northern California, the yield up to the time of the suspension of work, being nearly one million of dollars.

Placer Mining

Is not carried on very extensively in this portion of the county, though there are some claims on Indian Creek that are paying moderately well.

Around La Porte, Port Wine, Gibsonville, Saint Louis and Howland Flat extensive preparations are being made for next year's mining, and more gold will be taken out than for some years past.

At La Porte a tunnel is being run under Bald Mountain, lying to the northward of the town, and a rich gravel bed discovered.

This deposit has been prospected at various points and found to extend all the way to Gibsonville, a distance of some nine miles. Dr. Brewster showed me his claim on Slate Creek, which he proposes to work next year. The doctor has at a very heavy expense, run a tunnel under a point of rocks, changing the course of the stream, and gaining some 26 feet of fall. He is now putting in sluices for the purpose of sluicing out the tailings in the bed of the creek, that have accumulated there since '49 and '50. He is very sanguine of success and no man better deserves it.

Other claims are to be mined on a more extensive scale than heretofore, of which I shall speak in my next. W. M. A.

Crescent Mills, Dec. 22, 1871.

The Succession of Seasons.

EDITORS PRESS:—Following is the rainfall in this locality for December, 1871. With the exception of a shower on the 2d, the month continued so dry until the night of Sunday, 17th, that many and grave were the predictions of "another dry year."

Since then, we have had our share of the abundant rains which have fallen throughout our State, to make glad the hearts of our people. The heavy rains commenced between 7 and 8 P. M. the 17th. The result for the month is as follows:

DATE.	INCHES.
Dec. 2—Showers between 5 and 9 A. M.	0.04
" 18—To 7 A. M.	2.66
" 19—To 7 A. M.	1.93
" 20—To 7 A. M.	0.58
" 21—To noon	0.12
" 23—To 8 P. M.	0.54
" 24—Showers to 7 A. M.	0.02
" 27—Between 7 and 12 A. M.	0.17
" 28—To 7 A. M.	0.11
" 29—To 8 P. M.	0.44
" 30—To 8 A. M.	0.11
" 31—To midnight	0.47
Total for December, '71	7.19
Add for October and November, '71	1.33
Total to date for the season	8.52

This makes an *inch* and a *quarter* more than fell all last season; the entire amount then being 7.24 inches. In December, alone, we have had almost as much as fell in the season of '70 and '71.

If those who have a complete copy of Dr. Logan's Rain Table giving the rain for each month, at Sacramento, since '49, will compare the amount of rain this December, with the number of inches each December succeeding a dry year, they will find another remarkable agreement that tends to confirm the principle of a regular succession in our seasons, which was pointed out in the RURAL PRESS for November 11th. Attention has already been called to the fact that as far as past observations go, the Sacramento rain-table answers very well for our valley.

That table gives for Dec., 1851 ....7.07 inches
" " 1857.....6.63 "
" " 1864.....7.86 "
Now we have for Dec., 1871.....7.19 "

That is, for each December immediately after a dry year, our valley has had a little more or less than 7 inches of rain. Is this not a striking correspondence in seasons, to say the least?

It is very easy to say, "It just happened so." But does it not look as if there is a principle of succession here that has its origin in the laws of nature which produce the seasons in our valley? And does it not tend to confirm the inference that we may confidently expect a rainfall this winter ranging *at least* from 17 to 22 inches?

While speaking of these agreements, notice another, though not an important one, between the seasons of '64 and '71.

Whole rain at Sacramento in winter of '63 and '64.....7.86 inches
Whole rain at Sacramento, Dec., '64.7.86 "
Whole rain here, winter of '70 and '71.7.24 "
Whole rain here, Dec., '71 .....7.19 "

Close race that, between these December rains and the preceding seasons.

Turlock, Stanislaus Co., Jan. 1, 1872.

Unfermented Juice of the Grape.

EDITORS PRESS:—I have recently seen it stated that Dr. B. F. Headen of Santa Clara, has invented a process by which the juice of the grape may be preserved sweet or without fermentation any length of time. What the invention consists of I do not know.

I will give you, however, and the readers of the PRESS our mode of preserving the juice of the grape, or the juice of any other fruit, free from fermentation for any length of time. The process, as practiced by my wife, is original with her. She has so preserved the juice of the grape for the last ten or twelve years. That is to say, she has put up more or less of it every year for that length of time. It has not kept so long, however, because it is too good to keep. She has it now two years old, and I think some that is three.

You, and more particularly those "making inquiries as to where this unfermented juice is manufactured," will perhaps be a little surprised to learn that the process is identical with the one practiced by almost every housekeeper in the land in the preservation of fruit in tin cans, glass jars, bottles—that and nothing more. Both depend for success on the same principle—the exclusion of the air.

Any one who can put up, and preserve, without fermentation, a bottle of grapes, hulls, seeds and all, can, in the same way, preserve the juice *without* the hulls and seeds. Why not? It is a temperance drink, pure and wholesome, and contains not a particle of alcohol.

That none may fail who desire to try it, I give the mode in detail:—Gather clean, ripe grapes; strip them from the stems; put them into a stew kettle and bring to the boil; turn them into a sack, press out the juice; put the juice back into the kettle and bring it again to the boiling point; then set it off and with a funnel, fill it into bottles—champagne bottles are best—till they are full. My wife's mode of sealing is as follows:—Have some strong muslin cut into pieces two inches square, as many as there are bottles to be filled; then melt some resin in a convenient vessel; add thereto sufficient tallow to render it slightly elastic, so that it will not break or crack in cooling and admit air. With this melted resin cover one side of the two-inch square cloth; lay it over the mouth of the bottle and with the hand press it down around the neck of the bottle; tie a little string around it, then put a little more resin over the top. If the work is properly done I will guarantee it to keep from one to a thousand years—if not sooner drank. HIRAM POMEROY.

Milpitas, Dec. 25, 1871.

Reproduction of Forest Trees, Etc.

EDITORS PRESS:—I noticed sometime since an article in your paper in regard to the reproductiveness of certain native timber. I have been a resident of this State twenty-two years, during which time I have had ample opportunity for observing the growth and reproductive qualities of our different forest trees.

Redwood—Which is the principal material used for nearly all ordinary building purposes in this State, and which is being so rapidly used for the purposes mentioned, that the day is not far distant when it will be among the scarcest of our timber trees, reproduces itself by suckering, which process is so slow that it can only become beneficial to generations in the very distant future.

In proof of this I will mention a stump from which the tree was cut 18 years ago. This stump is six feet in diameter, and has put forth three suckers or shoots—the largest of which has attained a hight of about twenty feet, and is ten inches in diameter at the base. Now, if we cut this eighteen-year old sapling down, we will discover that the solid wood part is only about one-fourth the thickness of the whole tree, and the balance, owing to its spongy nature, is unfit for any use, and will decay a short time after being cut.

The Oaks—Of which we have several varieties, including what is known as white oak, black oak, red oak, live oak, and tan-bark or chestnut oak, are all, with one exception (white oak), reproductive by suckering; but none of which thus far—owing perhaps to climatic influences—have to any great extent been utilized, except for fuel and for tanning purposes.

The chestnut oak, is a very beautiful evergreen, much resembling the European chestnut in foliage. It is a rapid grower and can easily be raised from the acorns which are found scattered in abundance beneath the trees, in the months of September and October. I think when this tree becomes better known it will take the place of many other sorts now planted for shade and ornamental purposes.

The California Laurels also sends up shoots from the stump when the old tree is destroyed. Of this tree too much can not be said to encourage its propagation among husbandmen throughout the State. It is well known that the wood of no tree in the world takes a finer polish, and none that can be converted into more beautiful articles of cabinet work than this laurel. It is bound to become one of our most valuable forest trees.

This tree is also easily grown from the nut, which can be procured in any quantity from the old trees in the fall of the year.

The laurel flourishes best in moist places, though often seen on high ground. It is most frequently met with along the banks of all the perennial brooks of our State, where it rejoices in the fullness of its glory, its sweet, aromatic fragrance reminding us of its presence before we behold its glossy beauty.

CLEMILIUS KAMP.

San Jose, Jan. 3, 1872.

Eureka Lakes.

Were the reader traveling in Nevada County, climbing up the hills and pausing in the gorges to take a drink from a dancing streamlet, then on again up among the increasing boulders and cañons, a surprise would burst upon him in the shape of a group of Lakes—twenty-four in all—clustering around each other like the setting of a cluster-ring, and more beautiful in appearance than all the diamond clusters in the world.

Twenty-four—the largest only three miles long and scarcely a mile wide—all sizes and shapes, set in the hills with such a variety of scenery that one hardly knows where to look first, or what particular point to admire most. Pines and oaks ornament the strips of land between them, while a numerous variety of gorgeous flowering-shrubs, such as the wild lilac and manzanita, perfume the clear air with an exquisite fragrance. There is nothing particularly marked about any one of these Lakes, but the entire group of waterlets (if we may coin the word) presents a remarkable scene to the eye. They are situated in the eastern part of Nevada County, and ought to be one of the fashionable resorts of the State.

Nothing so really lonely and unique can be found elsewhere on the coast as this group of twenty-four pure-water Lakes; at a distance some of them look as if one's arms could span them—

"So wondrous wild, the whole might seem
The scenery of a fairy dream."

From any approach they seem to smile a welcome, and they really possess the look of "intelligent nature." If "the air hath voices," Eureka Lakes have smiles, and countenances that seem to change in a variety of sweet expressions as one changes position.

The smallest appears from a distance like

"A narrow inlet, still and deep,
Affording scarce such breadth of brim
As served the wild duck's brood to swim;
Lost for a space through thickets veering,
But broader when again appearing."

Another, but a trifle larger, hemmed in with flowering shrubs, its quiet face reflecting the shadows of the clouds; then still another, sparkling with glimmering rays of sunshine that rest in silver lines across it from shore to shore. And so we may spend days among them, hardly knowing which to admire the most, and wonder if other lands can have anything more lovely.—*Lisle Lester.*

APPLES WITHOUT BLOSSOMS.—Some time last spring there was considerable talk about apple trees that never bloom, and which have been very productive. During the summer Mr. Ely, of Norwich, Conn., sent some of these apples to the Farmers' Club of New York. The apples came originally from the farm of Mr. Ely's father, in Litchfield county, of the same State. The original tree has borne for over 50 years and still has never shown a perceptible blossom. The shape of the blossom end is very peculiar, and Mr. Fuller was requested to dissect one, and make such remarks as he might see fit and which might be of interest to all who participated in the former discussion or read about it in the papers.

Mr. Fuller remarked that Mr. Ely had not examined closely, or he would have found that his trees do bloom. We have in these specimens the proof that these are blooms—not perfect, however, because there were no petals, and this is why the man thinks there are no blossoms. The petals in almost any flower is merely an ornamental organ and not essential to the production of fruit or pulp. These apple blossoms had a calyx, for it is now upon them; they had also pistils, for they contain seed and probably stamens, as I find the dried up fragments of the same within the calyx. If our correspondent will examine his apple trees very carefully he will find that they do really bloom, although the flowers may be inconspicuous on account of an entire want, or deformed petal.

FINE CHROMOS.—The chromo lithographic art has now been brought to such perfection in America by Mr. J. Hoover, of Philadelphia, that lovers of beautiful pictures can supply their homes with "perfect counterfeits" of the rarest touches of the most gifted artists of both old and modern days. The popular pictures are unmistakably cultivating a new and elevating taste for fine arts in the American community. Mr. Hoover is constantly adding to his already long list of home prints. We have examined those mentioned in his advertisement in the PRESS and can say they are among the most attractive and popular of any yet published in this country.

Mechanical Progress.

The Durability of Timber.

A late edition of *Tredgold* on carpentry furnishes the following interesting and useful facts with regard to the durability of different kinds of timber:

In regard to the durability of different woods, the most odoriferous kinds are generally considered to be the most durable; also woods of a close and compact texture are generally more durable than those that are open and porous, but there are exceptions, as the wood of the evergreen oak is more compact than that of the common oak, but not nearly so durable.

Sir H. Davy has observed that, "in general, the quantity of charcoal afforded by woods offers a tolerable accurate indication of their durability; those most abundant in charcoal and earthy matter are most permanent; and those that contain the largest proportion of gaseous elements are the most destructible. "Amongst our own trees," he adds, "the chestnut and the oak are pre-eminent as to durability, and the chestnut affords rather more carbonaceous matter than the oak. But we know from experience, that red or yellow fir is as durable as the oak in most situations, though it produces less charcoal by the ordinary process. The following table of the quantity of charcoal afforded by 100 parts of different woods is added, for the information of the reader:

Oak, dry	22.6	Pine	20.0
Chestnut	23.2	Scotch Pine	18.4
Mahogany	25.4	Ash	17.9
Walnut	20.6	Norway Pine	19.2
Elm	19.5	Sallow	18.4
Beech	19.9	Birch	17.4
Fir	15.6	Sycamore	19.7

But it does not appear that the proportion of charcoal is a satisfactory criterion of the durability.

An experiment to determine the comparative durability of different woods is related in Young's "Annals of Agriculture," which will be more satisfactory than any speculative opinion; and it is much to be regretted that such experiments have not been oftener made.

"Inch and half planks of trees from thirty to forty-five years' growth, after ten years' standing in the weather, were examanined and found to be in the following state and condition:

Cedar, perfectly sound; larch, the heart sound, but sap quite decayed; spruce fir, sound; silver fir, in decay; Scotch fir, much decayed; pinaster, quite rotten; chestnut, perfectly sound; abele, sound; walnut, in decay; sycamore, much decayed; beech, sound; birch, quite rotten.

This shows at once the kinds that are best adapted to resist the weather; but even in the same kind of wood there is much difference in the durability, and the observation is as old as Pliny, that "the timber of those trees which grow in moist and shady places is not so good as that which comes from a more exposed situation, nor is it so close, substantial, and durable;" and Vitruvius has made similar observations.

Also split timber is more durable than sawed timber, for the fissure in splitting follows the grain, and leaves it whole, whereas the saw divides the fibers and moisture finds more ready access to the internal parts of the wood. Split timber is also stronger than sawed timber because the fibers, being continuous, resist by means of their longitudinal strength; but when divided by the saw, the resistance often depends on the lateral cohesion of the fibers, which is in some woods only one twentieth of the direct cohesion of the same fibers. For the same reason whole trees are stronger than specimens, unless the specimens be selected of a straight grain, but the difference in large scantling is so small as not to be deserving of notice in practice.

Of the durability of timber in a wet state, the piles of the bridge, built by the Emperor Trajan across the Danube, are an example. One of these piles was taken up, and found to be petrified to the depth of three fourths of an inch; but the rest of the wood was little different from its ordinary state, though it had been driven more than sixteen centuries.

The piles under the piers of old London Bridge had been driven about 600 years, and, from Mr. Dance's observations in 1746, it did not appear that they were materially decayed; indeed they were found to the last to be sufficiently sound to support the massy superstructure. They were chiefly of elm.

Also, in digging away the foundation of old Savoy Palace, Loudon, built nearly 700 years ago, the whole of the piles, consisting of oak, elm, beech, and chestnut, were found in a state of perfect soundness; as also was the planking which covered the pile heads.

On opening one of the tombs at Thebes, M. Belzoni discovered two statues of wood, in good preservation; the only decayed parts being the sockets to receive the eyes. The wood of these statues is probably the oldest in existence that bears the traces of human labor.

Mechanical Progress in the United States.

There is nothing which brings the material progress of the United States into more prominent light than a retrospective view of the condition of affairs forty years ago, in regard to the capacities of our mechanics to produce machinery. In 1828, the first locomotive was imported from England, to draw the coal-cars on the Carbondale and Honesdale Railroad, Pa.; the second in 1830, to run passenger-cars on the Mohawk and Hudson Railroad. The first American locomotive was built in 1830, in the United States Foundry, at West Point, for the South Carolina Railroad, and the third in 1831, for the Mohawk and Hudson Railroad, which road was soon abandoned and broken up for want of patronage.

In the same year Baldwin, of Philadelphia, made a miniature locomotive, which could draw two little cars with four persons; he exhibited it in Peale's Museum, in Philadelphia, and this exhibition laid the foundation for his fortune, and the large machine shop in that city, still bearing his name. In the following year, he received an order from the Germantown Railroad Company to build a large locomotive. It would have frightened any other man of less pluck, as in the whole city there were only five men who were able to help him, and no proper tools at all. He therefore commenced at once to make tools and patterns, and, incredible as it seems, in six months the locomotive was ready. It appears to have been a very delicate affair, as the advertisements in the Philadelphia papers of that day prove. They say, "Passengers to Germantown will go with a train of cars drawn by the new engine, when the weather is fair; when it rains, the horses will draw the cars."

Notwithstanding this, Baldwin's reputation was settled; before the end of 1834, he had finished five locomotives. He was then able to finish two small ones in a year; now the same shop finishes one of large size, with tender, etc., *every day*. The first small locomotives could run with a velocity of ten miles an hour, and draw one or two tons; the present locomotives have a speed of 40 miles per hour, and draw 1,000 tons.

A business commenced in 1831, with five men, without proper tools, in a small shop, (which still stands,) has increased in 1871 to a large manufactory grown around it, occupying a quarter of a million square feet, employing 2,000 men, and manufacturing four million dollars worth of locomotives per year, which are sent to California, Canada, South America, Europe, etc., in spite of European competition, of cheap labor, and cheap material.—*Manufacturer and Builder.*

Experiments with Lubricators.

A very elaborate series of experiments were recently made in New York to test the relative value of different lubricators. The experiments were continued during a period of fourteen months. The following were the general results and inferences: The consumption of oil varies with its temperature when applied.

Winter sperm oil, sustained the heaviest pressure, and was taken as the initial of comparison for all others, and their per cent. of lubricating value determined by it. The tests of mineral oils and mixtures of animal and fish oils with them would not sustain an equal pressure with the sperm, when equal quantities of the oil were applied, without rapidly increasing the temperature of the journals, and producing an abrasion of their surfaces.

When the pressure on the bearings were made equal with winter sperm, it required from 100 to 400 per cent. increase of oil, to keep the temperature of the journals below 100° Fahr.

Experiments were made at varied velocites, with the same oils. The results proved that as the velocity was reduced the pressure could be increased, and the relative consumption of oil, applied at equal temperatures, was decreased in almost equal ratio.

Scientific Progress.

Meteorites—Their Orbits, Etc.

Much attention has of late years been given to that erratic class of heavenly bodies known as meteors, or, as they are sometimes called, *shooting stars*. In rare instances these bodies reach the earth, and when they do, they are usually called aerolites, or meteoric stones, from the character of their composition. Those which reach the earth are not supposed to be in any way different from those which merely blaze out for an instant, or shoot across a portion of the heavens, leaving a bright train of light behind.

When they fall to the earth, their direction is such as to lead to an unavoidable collision; those which become visible, for a moment only, and do not fall, enter into and pass through the upper and more rarified portions of the atmosphere. If their direction is such that they enter deeply into the atmosphere, but not pointed directly to the earth's surface, their motion is so much retarded by the friction of the air, that their direction is sufficiently changed by gravitation to bring them to the earth, and thus end their existence as separate and distinct bodies in space.

Meteors are of all sizes, from those of a few grains in weight to those of many pounds or even tons. The former, on entering deeply into the atmosphere, are rapidly dissipated by the great heat which is created by their friction, and the consuming effect of the oxygen with which they come in contact. The larger ones are usually fractured by the great heat produced upon their surface, and fall in fragments to the earth. Their fracture is usually attended by concussion, which often sounds like the report of distant cannon. The continued, subdued roaring which is often heard during their flight across the heavens in their approach to the earth, is produced by the rushing past them, laterally, of the air, which falls rapidly in behind them, to fill the partial vacuum caused by their motion.

It has been calculated that not less than an average of seven millions of meteors might be seen from all parts of the earth, every twenty-four hours, provided the earth should move during that time through a clear sky, without any light from the sun or moon. If all the meteors which so pass the earth within the time specified could be brought into the field of a telescope, it is calculated, on reliable authority, that the number would reach fully four hundred millions!

All these bodies move around the sun, and late observations have established the fact that many, if not most of them, move in approximately concentrated orbits, like the asteroids; but unlike the asteroids, in extremely elliptical orbits, like comets. The path of the "November meteors" has its aphelion just beyond the orbit of Uranus, and its perhelion at or near the earth's orbit, and inclined about 17 degrees to that of the earth.

Careful observations have led to the supposition that there are at least fifty different rings of meteors, such as the November ring, of which, however, that is by far the most extensive. Chemical analysis has revealed the presence of at least twenty-three different elements in these meteors, out of the whole number of sixty five thus far discovered as composing the earth's substance. The names of these elements are as follows: Oxygen, hydrogen, nitrogen, sulphur, phosphorus, carbon, silicon, nickel, chromium, tin, aluminum, magnesium, calcium, potassium, sodium, cobalt, manganese, iron, copper, titanium, lead, lithium and strontium. The presence of these elements, found also in the earth, suggests a common origin.

The asteroids probably compose a "ring" very similar to the November meteors; but its great distance from the earth will not admit of any except its larger component parts being seen, even by the telescope. No doubt a closer view would reveal an almost illimitable number, even down to bodies not greater than the larger asteroids. These bodies are supposed to be either the fragments of an exploded planet, or a planetary body thrown off from the sun in the form of a ring, and aggregated into a great number of small bodies, instead of into one large body, like the earth and other planets.

From the eccentrity of the orbits of the meteorites, we might perhaps suppose them to be fragmentary portions of a cometary body, widely scattered in space, instead of being concentrated into a single body, as are the bodies known as comets.

The spectrum, that wonderful instrument of comparatively recent discovery, which is just beginning to be employed in the observation of comets, appears to indicate that these erratic bodies are composed of gases at a very elevated temperature. A careful microscopic study of many of the asteroids which have fallen to the earth, shows most conclusively that these bodies have at some time been in a state of vapor—as the comets now are—and that proximately they are made up of small rounded globules, which have accumulated and been more or less fractured by mutual impact, and finally consolidated. These supposed facts would seem to indicate a common origin for comets and meteors.

Action of Sulphurous Acid on Phosphates.—B. W. Gerland has been making some important experiments on the action of aqueous sulphurous acid upon phosphates, which have developed some points of great practical importance, especially in their bearing on the manufacture of artificial composts and soluble phosphates. He finds that aqueous sulphurous acid does not, like the strong acids, wholly decompose the phosphates, but transforms them into soluble modifications. The ordinary bone phosphate, called tribasic, is easily soluble in sulphurous acid, and if the solution be hastily boiled and evaporated in open vessels, a crystalline double salt, a mixture of trihasic phosphate with a sulphate of lime, will separate. This new acid remarkable body is said to be quite permanent, and in reference to its use as a disinfectant, and upon farm land it is certainly deserving of special notice. If we can by means of sulphurous acid decompose the phosphates, we shall avoid the expense of sulphuric acid, which must first be made from sulphurous acid, and obtain a product not so difficult to handle, and capable of a greater variety of uses than the superphosphates made in the old way. Mr. G. has studied the behavior of sulphurous acid towards other phosphates, the results of which, however, being purely theoretical we omit them.

Bromide of Potassium.—The increasing use of bromide of potassium, another of chemistry's contributions, would have been impossible, were it not for the extraordinary discovery of an apparently evaporated sea water bed in Germany. The amount of bromide consumed in medicine is now enormous, and most of it is derived from this source. The same mines have also completely changed our sources of potash; they produce far more than all the other sources of England and France put together, and have so reduced the price that carbonate of potash is now largely made in England at a price which competes most favorably with American pearlash, and will ultimately drive it out of that market. Bromide of potassium is an instance of a substance long used in medicine before its valuable properties were discovered.

Inhalation of Dust by Workmen.—The injurious effect of exposure to the dust of various manufacturing establishments has not unfrequently been dwelt upon with more or less force; but we are hardly prepared for the result of certain specific investigations on this subject. It has long been a disputed point whether the particles of iron, silica, etc., merely lodge within the air-cells of the lungs, or penetrate through their walls into the tissue between them. But Professor Zenker informs us that, on examining the lungs of a woman who had been exposed to the dust of iron oxide, used in preparing books of gold-leaf, he found the powder in the tissue between the air-cells and in their walls, as well as in their cavities. From less than two ounces of this lung over twelve grains of iron oxide were obtained by chemical methods; so that, if equally distributed through both lungs, there must have been at least three-quarters of an ounce inhaled. In another case—that of a workman exposed to the dust of a mixture used in preparing ultramarine substances—he found a quantity estimated at fully an ounce.—*Harper's Magazine.*

M. Devergie, a French chemist, finds that water containing only one four thousandth of its weight of carbolic acid sufficed for the disinfection of the Morgue in Paris during the hottest weather, when it contained six or seven bodies,

Mining Summary.

The following information is condensed mostly from journals published in the interior, in close proximity to the mines mentioned.

California.

AMADOR COUNTY.

Jackson Ledger.—Jan. 6: The recent storms do not seem to have affected quartz mining throughout the county, as we learn all our quartz mills are busy crushing rock, and the mines worked without any interruption caused by the storms.

Good.—Jackson *Dispatch*, Dec. 30: D. Worley informs us that his recently discovered claim, near Drytown, still continues to yield as brilliant prospects as ever—he being able to get sometimes as much as $8 or $10 to the pan.

CALAVERAS COUNTY.

Gwin Mine.—Calaveras *Chronicle*, Dec. 30: Operations have been resumed in the upper mine at Lower Rich Gulch, the shaft having been freed from water on Thursday last. Rock has constantly been taken from Alexander shaft, water not proving an obstacle.

What Cheer.—A very good quality of gravel is being taken from the What Cheer mine. In consequence of the storm but a small working force is at present engaged.

Good Hope.—After running a tunnel 350 ft. through solid rock the owners have "struck the lead" and paying quartz at the same time. Scarcely a piece of rock can be taken from the lead that does not carry free gold. The ledge is about 3½ ft. wide and has every appearance of being a permanent one. The Good Hope is an extension of the celebrated San Bruno mine, and there is every reason for believing that it will prove equally as valuable as the latter.

Petticoat.—The main shaft in the Petticoat mine at Railroad Flat has reached the depth of 350 ft. A fair quality of ore has been struck, and levels are to be commenced immediately.

Rich Rock.—Calaveras *Citizen*, Dec. 30: We were shown yesterday about a ton of quartz from the claim of B. K. Thorn, about one mile from town, which surpasses in richness any quartz heretofore found in this part of the county. It was taken from a depth of 240 from the surface, and gold is visible all through it. The lead at this depth, from hanging to foot wall is 12 ft. wide, about 4 ft. of which shows the above kind of rock, which will yield at least $300 per ton.

INYO COUNTY.

At Work.—Inyo *Independent*, Dec 23: Work on the big tunnel from the lower town of Cerro Gordo, to tap the Front at a depth of 1,000 ft., is being energetically pushed by the projectors, Messrs. Brady & Simpson. Two years will be required to complete the work.

NEVADA COUNTY.

Locations.—Nevada *Transcript*, Jan. 3: During the past year 178 instruments, locating claims or water rights for mining purposes, have been entered upon the books of the County Recorder. The number of claims is not so large, but the extent of ground covered by each Co., is much greater than formerly.

The Hibernia Co. in Grass Valley township, have located 1,200 ft. of mining ground near the tunnel of the Ural Co.

Banner Mine.—Grass Valley *Republican*, Jan. 5: Rich ore has been discovered in the south drift of the fourth level of the Banner mine.

Daisy Hill.—The storm has delayed the owners of the Daisy Hill mine in getting their pumping and hoisting machinery into operation. If the weather continues fair the machinery will be in working order in four five days.

Branch Mint Tunnel.—The owners of the Branch Mint tunnel, this side of Pittsburg mine, have at last struck the ledge in their tunnel, which is in the hill or ridge, a distance of 700 ft. The ledge is about 14 inches wide, and prospects well. A contract has been let for taking out a crushing of 25 or 50 tons of rock for a test.

Items.—Grass Valley *Union*, Jan. 4: The mill at the Greenhorn mine started to work on the 1st inst. after months of idleness. There is plenty of rock on hand to keep it running while water lasts. The shaft of the mine is down 227 ft. and levels have been started. The ledge is from 3 to 5 ft. wide and shows well in free gold. The Schuylkill mine, in Mary's Ravine at the foot of Hueston Hill, has a tunnel in 315 ft. to the ledge. The Co. have 230 ft. of backs. The ledge averages a foot in thickness and contains splendid sulphurets. Drifts are being run both ways on the ledge. The Co. has been 2½ years running their tunnel. The ground is very hard some of the work in running, cost $24 per foot. The Fillibneter Co., operating in Gravel on the Washington Ridge 8 miles above Nevada city, has been successful. On Saturday before Christmas miners struck into gravel which prospects from $2 to $3 to the pan. The Co. has run 800 feet.

PLUMAS COUNTY.

La Porte.—Quincy *National*, Dec. 23: Kirk, McClellan, Hiland, and Hersom have taken the contract to run, the Bordwell & Co. tunnel. It will take 2 years to finish the contract.

The members of the Illinois. G. M. Co. held a meeting on the 11th inst., and organized.

SAN DIEGO COUNTY.

Bullion.—San Diego *Union*, Dec. 21: There was shipped by W. F. & Co. on the steamer California, bullion amounting to $1,100.

The Mines.—The news from the mines in our county continues to be most encouraging. Nearly every lead is being worked, and many improving in richness as they go down. The mills are steadily employed night and day in crushing rock and the only trouble with the miners is that the facilities for taking out the gold are not sufficiently extensive. The addition of the new mill to those already in operation will remove this trouble in a measure. The work done by the mills at present gives satisfaction to the owners of quartz ledges, as they are run in good style. The mills of Gunn, Reynolds & Co. and De Frees & Co. are both engaged at present on rock from the Owens lead. They commenced crushing quartz from this mine 2 weeks since, and both mills have been steadily at work night and day ever since on the ore. The clean up, which will take place in a day or two, will be the largest yet made in the mines. The Whitney & McMechan mill has been running for some days on ore from the Golden Chariot mine. As the ore is of the same character as that crushed some time since, which yielded $153 per ton, we may expect a large result at the clean up.

SAN LUIS OBISPO COUNTY.

The New Quicksilver Mines.—San Luis Obispo *Tribune*, Dec. 23: Capital mines have been discovered in the new diggings. The croppings of quicksilver ore are very extensive, and have been followed for a distance of 5 miles northwesterly from the Pine mountaine, and southeasterly, in the direction of Santa Rosa creek, a distance of over 10 miles. The most promising locations are those of the Pine Mountain Co. the Little Almaden, the Garibaldi and the Occidental. The latter is considered one of the most promising locations in the mineral range.

YUBA COUNTY.

Oregon Hill—Marysville *Appeal*, Jan. 4: The miners in this section are all at work excepting those who have creek claims. These claims are lying idle, owing to the water, which is higher than it has been since the winter of '61 and '62. It is supposed that this season will be the best for mining purposes of any since the winter mentioned.

Nevada.

ELKO COUNTY.

Lucin.—Elko *Independent*, Jan. 6: The Buel & Bateman furnace will start up again on Wednesday next. The mines generally, are looking well. The Iron Clad, No 1, has an incline down 40 ft., showing a ledge from 7 to 10 ft. wide, of carbonate of lead ore, which assays 50 per cent. in lead and about $20 per ton in silver. New ledges are being struck almost daily, some of which present flattering prospects. About 100 men are now burning coal for the smelting works. Ore is being shipped from the dist. to Reno for reduction.

EUREKA DISTRICT.

New York Canon.—Eureka *Sentinel*, Jan. 3: Much work is being done in the mines in the neighborhood of New York Cañon. The South Eureka M. Co. are prosecuting work on their mine (X. Y. Z.), and have more ore than they can find room for on their dumps. J. Drieshach is working the Fourth of July mine with gratifying prospects. A splendid vein has been disclosed, which is continually increasing in size as depth is attained. The Golden State has fine prospects. The main shaft is down 70 ft., and a splendid body of ore has already been developed.

ELY DISTRICT.

Bullion.—Pioche *Record*, Dec. 31: W. F. & Co. shipped since Dec. 24th, bullion valued at $182,041.72, of which amount $33,060.23 was shipped by the Raymond & Ely.

Rich Strike.—A rich strike is reported to have been made on the divide between Pioche and Highland.

Our Mines.—On the Page & Panaca, work has been commenced at the lower level to sink a shaft an additional 100 ft. before drifting to the ledge. The shaft of the Newton Booth has been sunk through the ledge, now sinking in very hard quartzite. The American Flag is looking very well and shipping the usual quantity of ore. The Chief of the Hill is rapidly developing into a first class mine. The ledge improves in solidity and richness of ore as depth is attained. The Hermese, Newark, Ingomar, Oneida and other claims on the Panaca flat are being worked steadily with good prospects. Every portion of the Raymond & Ely mine is looking well. The Pioche is still doing dead work and prospecting for ore; mine steadily improving.

HUMBOLDT.

Golconda Dist.—Unionville *Silver State*, Jan. 6th: A San F. Co. will commence work on the Cumberland mine immediately. The Cumberland ledge was one of the first locations made in the dist., and is considered one the best mines in the locality. The ore is argentiferous galena, worth on an average about $70 per ton in silver. A portion of the ore contains sufficient lead for smelting.

Improving.—The incline started some 2 months since, is down about 135 ft. The vein is full 4 ft. in width, and continues to improve in quality. The mine throughout is yielding well, and in good working condition.

REESE RIVER.

Bullion Shipment in 1871.—Reese River *Reveille*, Jan. 3: W. F. & Co. shipped from this city, during the past year, 1272 bars of bullion, 103,231 lbs., valued at $1,166,707.31. This does not include shipments by the Stage Co., and by fast and slow freight, which would bring the total shipments up to more than two millions, most of which is the product of the mines in the vicinity of this city and Belmont.

W. F. and Co's., Bullion Shipment for Dec.—W. F. and Co. shipped during Dec., 172 bars of bullion, 12,496 lbs., of the value of $137,561.74.

Manhattan Bullion for Dec.—The Manhattan Co., during Dec., turned out and shipped from their mill 77 bars of bullion, 6,662 lbs., and of the value of $87,502.49.

During the 9¼ months which the Manhattan Mill was running in the last year, it turned out 834 bars of bullion, valued at $894,465.98.

WASHOE.

Bullion.—Virginia *Enterprise*, Jan. 6: The Crown Point Co. yesterday shipped $40,000 in silver bars. Weight 1,600 pounds.

WHITE PINE.

East Sheboygan.—White Pine *News*, Dec 30: Connection is made between the South Original tunnel and the North shaft, and all the works of the mine are ventilated. Two drifts, one to connect the Exchange and Original drifts, and the other turning East. There are about 1,500 tons of ore on the dumps, and the Manager estimates that there are 24,000 tons of ore in sight in the different openings. The last crushing-out of ore turned out $95 to the ton, pulp assay. A force of 24 men is employed at present in and about the mine, and the same number will be employed during the winter, breaking down ore and hoisting it to the dumps.

North Aurora.—Since the tramway started up with a new cable, the ore that accumulated on the dumps of the Risdale chamber is being shipped to the International mill. The ore in this chamber holds out in quantity and grade. The south drift in the Lady's chamber still shows an extensive body of ore (much of it assaying high), and the body increases as the chamber is opened.

Eberhardt.—Stormy weather prevents work in the open cut. The drift from the Keystone shaft is going ahead as usual.

Truckee.—This mine is on Blue Hill There is a cut running into the hill 100 ft. in length, showing ledge matter the whole distance. There is a fair quality of ore in the face. It is estimated that there are 100 tons of ore on the dumps that will mill from $35 to $40 per ton.

South Aurora.—The main lower tunnel is pushed ahead rapidly by contract. Mr. McDonald, Foreman of the South Aurora Co's. mines, is of the opinion that the tunnel will tap the mineral belt about the 1st of April.

South Ex. of Hidden Treasure.—The ledge matter in main north shaft looks favorable for the development of a fine mine. The drift from the Anchor tunnel is pushed ahead rapidly.

Iceberg—This mine turns out over-average milling ore. At present the ore is hoisted and piled on the dumps, for shipment to mill when the storm subsides. The whole underground force of miners is employed breasting out.

San Juan Del Rio.—The ore-body in right has increased in size since our last report, and bunches of rich ore come in mixed with the second class.

Silver Wave.—Persons who have visited the mine report work going ahead vigorously in the Perkins, Lyford, Chamberlain and No. 4 shafts.

Noonday.—The bad condition of the roads prevents shipment of ore to mill. The ore is piled on the dumps. Hoisting about 3½ tons daily.

Ward Beecher.—The ore in the east end of the mine is of a fair milling quality, and holds out the usual body.

The proceeds of the mines for the year will foot up nearly $2,500,000; and had several of the promiuent mines—now, and for the past 4 months, doing dead work for the purpose of prospecting and making openings—been operating in ore, the turn-out of bullion would have reached $3,000,000.

Outside Dists.—Ruby Hill.—The mill of the Ruby M. & M. Co. is ready to start up as soon as quicksilver arrives, which is on the way. The Cow & Calf has several tons of ore on the dump, estimated to go upward of $1,000 per ton, ready for shipment to this place, and a lot of second class which will be worked by the Ruby mill.

Arizona.

Mines and Mining.—Prescott *Miner*, Dec 16: In Yavapai Co. work is progressing upon the Tiger, Lorena and other lodes, in Tiger Dist. From information recently received, we give it as a fact that the Tiger mine, at this time, shows better than at any previous time, which implies the fact it is richer and larger. At a depth of 100 ft. and at the end of a 100 ft. tunnel—driven northwards along one face of the lode cutting across the vein—has developed 32 ft. of rich quartz, most of which will pay to ship. Out of the Lorena, too, some very rich rock is being taken.

In Pine Grove Dist. Jackson, Shoup & Co., are making things tell. They have recently struck a good-sized vein of water, and their little mill is thumping away.

In Walker Dist. Mr. Pointer and others are taking ont ore, and many placer mines are "rocking." The water is yet "light."

In Hassayampa Dist. placer miners are making fair wages with rockers. Work upon the new series of silver ledges—Benjamin, Bismarck, etc., is being pushed. Col. Bigelow's report is favorable. He has 3 tons of ore sacked and ready for shipment.

Col. Cany appears to have a "big thing" on quartz in the Black Hill region.

In Walnut Grove Dist. some mining is being done, and it is thought that Mr. Rush's mill will be set up in the Dist.

In Weaver Dist. the Great Sexton and one other lode are being worked with great satisfaction.

In Wickenburg Dist. the Vulturo Co. have changed Supts.

In Mohave Co. Wallapai Dist. is giving a good account of itself.

In Yuma Co. the Castle Dome mines are turning out well. Considerable placer mining is being done at the Laguna, Gila city and other points.

In Pina Co. the mines near Florence are now the text upon which miners preach.

Maricopa Co. has some rich mines which are being developed, rather slowly, but surely.

Colorado.

Shipped.—Georgetown *Miner*, Dec. 14: The Stewart S. Reducing Co. have shipped for the week ending to-day, bricks (gold and silver) valued at $3,381.68, also 2 lead bars valued at $508.68. Palmer & Nichols have shipped for the same time 1 bar 729 fine, valued at $964.81, Campbell & Clark are shipping ore taken principally from the Clark S. M. Co. in the Terrible lode. Gen. J. Marshall is shipping very rich smelting ore to Swansea, Wales. He has now a car load of Equator ore in preparation for shipment to the same place. Since our last issue, Baily & Nott have shipped on account of owners, only 5 tons of ore. The heavy state of the road has prevented larger shipments.

New Mill.—N. B. Judd & Co., of Chicago and F. W. Crosby, of this place, Supt., will commence the work, this week, of preparing the ground for the erection of a large mill, for the treatment of silver ores at an early day in the spring of 1872. The site selected and purchased for the mill is just below the devil's gate. The mill will be built on the most approved plan, and will be run by water power.

Caribou.—Carihou *Post*, Dec 23: The weather is not cold, and mining continues

wherever suitable shaft-houses are built over the mines. The splendid opening of the Wabash lode, on Caribou hill, about 1,000 ft. south from the Caribou lode, and running parallel with it, is most encouraging.

Pillars of "ground" containing surface quartz are still being mined on the Gregory lode, where it was supposed none existed. Parties are at work taking out a "pillar of quartz" about 40 ft. from the surface, that carries a crevice of pay ore 12 or 15 inches in width, that looks as if it would yield a handsome return.

Myers & Co. are putting up an Arey furnace in the Buford G. M. Co.'s mill at Masonville.

D. Hodgson, who is working a coal mine near Saint Vrain post office, 35 miles down the Platte, is taking out from 15 to 20 tons of coal per day. The vein furnishes about 5 ft. in thickness of good clear coal.

Nichols & Co. are making active preparations for work on the U. P. R. lode.

Prospects of 1872.—Central *Herald*, Dec. 27: Among the new works ready for ores and those that will be completed early next spring, are Breed & Cutter's at Middle Boulder, capacity at least 20 tons daily; the Boston As. Works at St. Johns, Summit Co., capacity 25 tons or more; St. Lawrence Works at Montezuma, Summit Co., 20 tons daily; Prof. Du Bois' Smelting Furnace and Chlorination Works, Buckskin, Park Co., capacity not known to us; Works in Ward Dist., Boulder Co., capacity not known to us; and Baker Mill at Bakerville, Clear Creek Co., capacity about 20 tons daily. Among the projected works whose construction next summer seems quite certain, are the Miner's Smelting and Reducing Works, to be located in Gilpin or one of the adjoining counties; Smelting Works of large capacity at or near Georgetown, in Clear Creek Co.; Smelting Works at or near Fair Play, Park Co.; Mill and Furnace in Lake Co., near Oro City; and Smelting Works near the San Juan silver mines in Conejos Co. In addition to these stamps, mills will be erected at different points in the gold dists. and some old works which have been silent for years, again be put in operation.

A considerable quantity of rich ore is being milled from the Gunnel lode, on which 8 claims are worked. The Church Bros. have recently put in one of Clark's patent furnaces at the Gunnel Central Co.'s claim, which they are working under lease.

The heaviest gold producing lodes in Gilpin Co. at present are the Kansas, Kent Co., Leavitt or Kip, and California lodes. The Illinois, Prize, Sudehurg, Fiske, Ashtabula and many other mines are also being more or less extensively worked. The 4 first mentioned lodes keep over 200 stamps in motion, of which the Kansas employs nearly 100.

The various stamp mills of Black Hawk and Nevada are well supplied with ore and with an abundance of water. Fourteen or fifteen mills are in operation in Black Hawk and 6 in Nevada and Eureka Gulch. Nichols & Fisher started up the Cons. Gregory on Tuesday on Kent Co. ore.

A. N. Rogers is pushing work vigorously at the Black Hawk tunnel, below Gregory Point. Nine men are employed under ground, 2 outside, and 1 at the blacksmith shop. Work has progressed during the past 3 weeks at the rate of 14 ft. per week, and the head of the tunnel is now 485 ft., being very near the line of the Fisk lode.

J. Smith has been busily engaged for many weeks in enlarging and timbering the shaft of the Coleman mine on the Gunnell lode, which, previous to this Fall had been idle for many years. At great labor and considerable expense the mine has been put in first class working order, and sinking and drifting will be resumed next week. The ore is unusually rich and the crevice of fair proportions. The shaft is 65 ft. deep.

Grand Island.—The Caribou mine is being worked energetically and is producing large quantities of silver ore. At the bottom of the main shaft, 235 ft. below the surface, the body of ore is 8 ft. in width. Four levels are being worked, and the greatest length of the mine now opened extends 350 ft. from east to west. On the east side, the upper drift has been stoped out to within 12 ft. of the surface. One hundred and thirty ft. is another shaft, over which a whim house is being built. Ore from the west shaft is raised by a windlass. These shafts are now all connected hencath the surface by a level. Sixty men are employed in the mine, which force will soon be largely increased. Mr. Breed expects to have the mine opened within the next month, so that 25 tons of first class, and a much larger quantity of second class quartz can be raised per day.

The reduction works at Middle Boulder were to have commenced operations to-day with E. Sherman as Supt. and E. E. Peters as assayer and refiner. Eight men will be required to run the mill and as many more will be employed outside in connection with the establishment.

Among the lodes worked near Caribou are the Elephant, Eureka, Grand View (reported sold to St. Louis parties), the Seven-Thirty, Boulder Co. and Trojan.

The late new discoveries in Peewink Dist. 6 miles northeast of Middle Boulder, are exciting much interest; among them is one which displays a 3 ft. crevice showing much silver glance.

At Middle Boulder Hinds & Hetzer's 10 stamp mill is running steadily on Trojan and Boulder Co. (gold) ores. Claims on the latter are worked by Congdon, Morgan and others, from which the selected ore yields about 9½ ozs under the stamps—the gold selling in Central at $17 per oz. The Trojan quartz, at the same mill, as it comes from the mine, without assorting, runs from 7 to 14 ozs.

J. Millen is working the Kip or Leavitt lode. It produced 126 tons of ore in Nov. from which over 800 ozs. of gold were obtained from the stamps, or considerably over $13,000 product of the month. During that time 18 men were employed in the mine and about 50 stamps in crushing the ore.

The only claim worked on the Gregory Second lode at the present time is Cave & Mellor's. They are sinking and drifting ata depth of 265 ft. though out of pay at present.

B. P. Haman has struck a lode near by his house in Russell dist. which yields 8 ozs. of gold to the cord.

Sullivan & Wheeler's claim on the Kansas lode enables them to keep 40 stamps at the New York mill in constant motion.

Idaho.

South Mt. Assays.—Silver City *Avalanche*, Dec. 30: Mr. Deniston furnishes us with the following assays of St. Croix ore; Surface ore, $53.39 in silver; decomposed ore, 5 ft. from surface, $186.80; ore from shaft, 16 ft. deep, $356.43. The vein is well defined and 10 ft. wide.

The recent strike in the 7th level of the Elmore is proving rich beyond all expectations.

Bullion City.—Cor. same: Work in the mines has almost been suspended on account of the recent had weather. B. Cook is still at work on the Bay State, which looks splendidly. Wm. Hastings has commenced work on the May Queen which opens out well.

Montana.

Philipsburg.—Deer Lodge *New North West*, Dec. 23: Everybody is at work in and around Philipsburg. Col. Morse says of the 90 men in camp, none are idle. Brown & Plaisted are developing the Cordova, the first lead discovered in Flint Dist., and getting out very rich ore. They are also at work on Comanche extension. Other leads are being developed, and there are several hundred tons of custom rock out. Col. J. J. Lyon is making a success of his enterprise. The mill will start up in Jan.

Cable.—S. Cameron brought in from Cable, on Thursday, 264 ozs. of gold bullion—value, $4,884—crushed from 125 tons of Cable ledge ore, in a 5 or 6 days run finished on Tuesday. Mr. Cameron has been prosecuting work vigorously on the ledge, and has 10 ft. of very rich rock in the shaft at 231 ft. In the incline on the south wall he has plenty of quartz but not very rich. He has a drift now in from the shaft 190 ft., and believes he is within 15 or 20 ft. of the ore. Twenty men are working in the mine, and there are about 50, all told, in the Camp.

Cedar Creek.—Missoula *Pioneer*, Dec 23: The prospects for the coming season are very flattering. There are about 300 miners wintering there engaged in drifting and preparing their claims for a vigorous mining campaign next season. A new discovery was made on a bar above Forest City, late in the fall, which promises to be very rich, although the extent has not yet been ascertained. Mr. Roosevelt reports having made an important discovery while *en route* from Cedar to this place.

Utah.

Ophir.—Cor. S. L. *Tribune*, Dec. 27: I visited the Mayflower tunnel, the location of which is some 250 ft. below the Silver Exchange and Sunny Side mines. The object of this tunnel is to prospect for "blind" leads that may be lying between the starting point of the tunnel and the top of Lion Hill. In its course the Sunny Side, Silver Exchange, Mountain Lion and Defiance mines will be tapped. Two men have in 4 months' time driven the Mayflower tunnel through solid limestone rock for a distance of 120 ft.. The proprietors calculate that about 125 ft. further will bring them to the first of above named mines; but from indications existing in the face of the tunnel, it is believed that a deposit of ore is in the immediate neighboorhood.

Camp Floyd.—Cor. S. L. *Review*, Dec. 23: The Silver Cloud Co. are employing a large force and are taking out a steady supply of fine ore. They find it better the further they go. All the mines on the Silver Hill side of the cañon prove to be of immense extent and richness the further they are developed.

The Camp Floyd M. Co. have struck large bodies of horn silver on the Last Chance and Sparrow Hawk. I should estimate the ore in sight at the mouth of the tunnel on the last named mine to be worth at least $20,000 without entering the tunnel or counting the ore piled on the dump. The Last Chance shows plenty of horn silver and sulphurets in almost every piece of their quartz. These mines have been opened recently by 3 new tunnels, and all show the most unmistakable signs of paying ore within. The peculiar formation of this vast vein or deposit of ore presents the most favorable opportunities for working by tunnels. So far as has been proved, the vein has a dip of only about 18 or 20 degrees towards the north, with a slight dip to the east, so that a tunnel run in a northwesterly direction will have an almost level course, from which side cutrics can he run north and south.

The Queen of the West after lying idle for several weeks, opens up again on Monday next, and will run continually the rest of the winter, purposing I believe, to have a large quantity of ore ready for spring crushing.

Fine Bullion.—W. F. & Co. received on the 2d, from the Raymond & Ely works, 11 bars of bullion worth $33,060,23. Yesterday the same house received from the Meadow Valley works, 5 bars worth $5,845,-83, all of which has been shipped to New York.

Timmins Dist.—A large number of the mines are being worked with good results, though no great depth has yet been attained. The principal ones, are the Mammoth, 28 ft. down, the Sultana, 40 ft., the Mountain Queen and the French, 20 ft., Olive Branch, 25 ft., Great Western 25. Besides these there are a great many claims upon which sufficient work has been done to hold them. The prospect is that labor will be continued on most of the mines mentioned, through the winter. Timmins, Dist. is at the foot of Mt. Nebo, 5 miles from the town of Nephi, Juab Co. 70 miles from S. L. City.

In the Vermillion mine the ore is chloride and galena. The mine is bonded for a large sum, consequently there is no work being done on it now.

San Francisco Mining Stock Market.

Thursday Eve., Jan. 11, 1872.

The mining stock market has been moderately active this week. The sales at the Stock Board for the week ending Wednesday, Jan. 3d, amounted to $2,702,800. On December account $117,200 have been received from the Raymond & Ely mine. During the past year this mine has turned out $1,361,600 in bullion, of which $615,000 have been disbursed as dividends. The Belcher and Crown Point Co.'s have again begun to declare dividends as will be seen by reference to our Shareholders' Directory. The assessments of the Empire Mill and Imperial companies will amount to $12,000 and $40,000 respectively.

The receipts from the North Star (Grass Valley) mine for December were $19,850 which. after deducting the amount drawn for expenses left enough to declare a $3 dividend, aggregating $9,000. The dividend of the Belcher of $10 per share will amount to $104,000 and is the first one ever declared by the company, although the mine has been worked for years. On the 5th of October, 1870, the mine was worth, according to the value of the stock ($1 per share) $10,400, but on the 2d inst., according to the same basis ($490 per share) it was valued at $5,096,000.

The receipts for Decemher from the Savage mine were $56,131. At the annual election of the San Francisco Stock and Exchauge Board on Monday, the following officers were elected to serve the ensuing year:—President, E. P. Peckham; Vice-President, Geo. W. Smiley; Caller, B. H. Coit (re-elected); Secretary, Franklin Lawton (re-elected); Treasurer, Henry Schaiedell (re-elected).

Leather Market Report.

[Corrected weekly by Dolliver & Bro., No. 109 Post st.]

San Francisco, Thursday, January 11.

Sole Leather.—The demand is still equal to the supply, and prices still continue firm.

City Tanned Leather, ₱ lb	26@29
Santa Cruz Leather, ₱ lb	26@29
Country Leather, ₱ lb	25@28

The market is well supplied with French stocks, and prices have a downward tendency. Heavy California skins are firm, with an upward tendency.

Jodot, 8 Kil., per doz	$60 00@
Jodot, 11 to 13 Kil., per doz	76 00@ 85 00
Jodot, second choice. 11 to 15 Kil. ₱ doz	60 00@ 80 00

Our Mining Prospects.

The prospects throughout our mining regions are the hrightest that have heen seeu since 1864, and the eonstantly increasing eonfidence in mining operations is due to the eontinued yield of paying properties, new diseoveries, and improved faeilities for extraeting and working ores. In Washoe, tho lowest grade ores are now mado to pay, and in California, gold quartz veins, whose gross yield is not more than from $6 to $8 per ton, are worked to great profit. An artiele on the mining review of the year in the *Bulletin* says that the past year, although it has not been distinguished for a large produetion of the preeious metals on this eoast, has, nevertheless, heen generally propitions to the mining interest; many improvements having been iutroduced iuto the business and many substantial gains effeeted, while eapital has come to its aid more freely than ever before. The amount of money invested on aeeount of legitimate mining has greatly exceeded that of any former year; these investments having heen made as a general thing, with sueh eireumspeetion and judgment as must insure for them favorahle results. To the dronth that has prevailed, for two sueeessive years, having been espeeially stringent during that just elosed, is due this restrieted yield of the precious metals; it having been so severe as to seriously interfere with both vein and placer mining. Owing to this cause many ore erushing mills dependent on wator power for propulsion and even a eonsiderable number driven hy steam were obliged to remain idle both in this and the adjoining State of Nevada, thereby greatly eurtailing the produet of hoth our gold and silver hullion.

New Improvements.

Inveution has heen rife during the year, our mill-men and miners giving hearty encouragement to every proeess or deviee promising to seeure a saving of labor or more efficient mode of amalgamation. As a consequence, a great many eeonomizing agents and a more potent metallurgy has heen generally introduced, this spirit of innovation having extended to every line of improvement and pervaded every hranch of this industry.

We have had improved sereens, stamps aud batteries, mill-gearing, pumps and nozzles; patent drilling maehines, furnaees and amalgamators, eoneentrators for saving the sulphurets, and new methods for their ehloriuation, with tramways for the eheap and speedy transmission of ore from the mines to the mills, and a great variety of other inventions for expediting operations and saving the metals.

Nor in this eagerness for seeuring larger pecuniary gains have higher eonsiderations heen lost sight of, more effieient plans have heen adopted for the ventilation of the mines, valnable additione have been made to the safety eage, and a meaus diseovered for laying the nitrous fumes of Giant powder and eimilar exploeives with numerous other heneficent schemes and agents ealled in, or snggested, for insuring the health, life and limh of those employed in nnderground operations, in all which we pereeive that our miniug population has heen undergoing a valuable schooling of late, tending to qualify them for an enlightened and successful proseeutiou of this great industry whieh has heen advanced meantime to a mueh higher plane than it occupied hut a little while ago.

Future Product of Bullion.

With all these aids and improvements these reforms effeeted, with so mueh auriferous earth and milling ore aeeumnlated, and more thau all, with the present prospeet of an abundant water snpply, we may eafely count upon an immense produetion of bullion for the coming year. Indeed it is quite likely that the out-turn of the preeious metals, including the entire seope of country west of the Rocky Mountains, will greatly surpass that of any preceding year. In California we shall have as new contributors towards such results a numher of large hydraulic claims with much drift ground, lately opened and fitted up for operations; also in this State, several additional cement mille, many new and enlarged qnartz mills, with similar establishments, besidos numerous moro efficient roasting furnaces and new smelting works throughout the entire mining regions. We shall have the eapaeious ditches and reservoirs, the improved processes, the aid of eapital and all the miuor agents and applianeess before mentioned for activo allies, making sure of a large and constantly increasing product of hullion hereafter. With the advent of the current year we shall enter upon a new and better era in our mining history, the first fruits of which we are already beginning to reap.

Utilizing the Low Grade Material.

Some idea may he gained of the improvements lately effeeted in mining on this eoast from the faet that we are now everywhere redueing with profit a class of ores that would not a few years ago have yielded enough to pay the cost of their extraction. In the Washoe district thousands of tons of snoh ores are being milled annually with satisfaetory results, notwithstanding the greater depths from whieh they have now to he lifted; while the working of the tailings there, that were before suffered to ruu to waste, eonstitntes at present a large and luerative hraneh of husiness; extensive mills having been huilt and other eostly preparations made for that purpose.

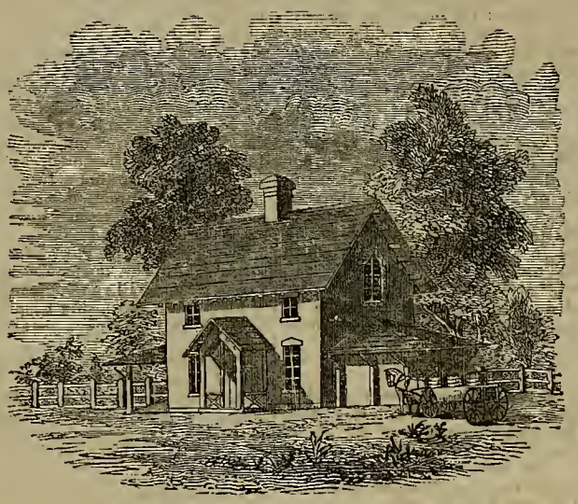
In California large fortunes are being realized hy the reduction of gold bearing qnartz that affords not more than $8 or $10 to the ton; and even mueh money made in milling roek, where all the eonditions are favorahle, that gives a gross average return not exeeeding $6 or $8 to the ton. With the powerful nozzles, improved under-eurrents, riffles and other applianees now in use, auriferous gravel can be washed that yields only five cents to the eubie yard; and although it is diffieult to eee how mueh more ean he aeeomplished in that diroetion, it is probable that as in the past, so every eoming year will hring with it something gained in the effieieney and eeonomy of this elass of operations, thereby giving corrosponding enlargement to the area of our availahlo mines and finally earrying this industry into fields now considered hopeless, or perhaps wholly unkuown.

Already we are in advanee of all other gold and silver-hearing eountries, both as regards perfeetion of maehinery, effieieney of proeesses, and novelty of invention. Our ore crushing apparatns and amalgamating pans have not been surpassed elsewhere; our safety eages are an improvement over all others; the employment of immense powder blasts for shattering and hreaking down masses of earth, seem to have originated with ns, while the hydraulie mode of washing, with its ingenious paraphernalia, not only had its origin in, but seems thus far to have been confined to, California; not to mention a multitude of miuor hut highly useful and ingenious contrivanees for whieh our people may justly claim the eredit of invention.

With eo mnch that is new and peculiar iu the means used for working them, our mines themselves preseut some features of novelty. In our gold beaches and bluffs, our dead rivers, tahle mountains and deep gravel beds, as well as in our reeently-diseovered seam diggings, we meet with geologieal wonders and strange modes of deposits, not common, nor, perhaps, at all encountered elsewhere in the world.

A Cheerful Outlook.

In conelusion we may, after having thus hriefly surveyed the field, repeat the remark made at the ontset, that the past has been a generally auspieious year for the mining interest; adding that the ontlook was never more cheerful than now, at its elose. Purged of its mistakes, aud with eonfidenee restored, the future of this industry is full of encouragement. With eapital ready to aid legitimato enterprise, and a praetieal education guaranteeing for it safe and profitable employment, we may safely eount on more favorable results than have heretofore generally attended thie business. What is learned iu the school of adverse experienee is apt to he learned well—no lessons heing so franght with wisdom as those of personal trial. We are now huilding a euperstrueture on tho hed-rock—rearing up a generation of miners praetically trained to the husiness, and who, heing familiar with all its mysteries and requirements, will be fitted to respond to them in an intelligent and eapahle manner.



PERSPECTIVE VIEW OF A CHEESE DAIRY.

Dairying in California.

Sinee no State in the Union, perhaps, eontains a larger area of land suitahle for dairying, and certainly none where the elimate is hetter adapted to the business, than California, it is not a little remarkahle that nearly one-half of all the butter and cheese we eonsume should he transported to us over the longest railroad in the world, aud at the highest rate of freight anywhere known. Some elaim that over one-half of the hutter and eheese eonsumed here is thus imported; hut the question is not how mneh, hut why any amount whatever is thus obtained.

GROUND PLAN.

Very good dairy land can be had hero at from $5 to $20 per acre, and convenient to transportation. Dairy eows can be raised and pastured here as eheap or cheaper than in the Atlantic states, and ean be kept for less than half the cost there. Labor is very nearly as cheap as at the East and living mneh cheaper. Of eourse nothing need be said with regard to the superiority of the climate of California, where neither stable feed or shelter is used (although it might be used to advantage).

Siugular it certainly must appear to visitors here, that with all these advantages in onr favor, Eastern dairymen are growiug rich on their eold, hleak, rocky farms, in making hutter and cheese for the California market; and yet we are told that the few who have gone into business here, with intelligenee and energy have made money at it—prohahly less failnres having oeeurred in that business than in almost any other whieh could be named. We might give names and facts and figures; and at some future time perhaps we may do so, as there are ahout 1,000 dairies in the State, averaging from 30 to 300 eows eaeh—a few being mueh larger.

Perhaps the greatest drawbaek is the nneertainty of the labor market in this State, and the disinelination of lahorers to go out from the great eentres of popnlation to engage in *hard work*. Quite too large a proportion of our people are inelined to stiek to the eities and towns to do *head work*. Single men are partieularly so inelined, and when the eares of the family begin to press upon the married man, he is too often foreed to forego a favorable opportunity to enter npon the dairy or some other good bnsiness in the eountry because his *helpmate*, eannot endure the isolation of California life in the country—where the latest style of a Parisian bonnet is never seeu. What we want here is a few thousand aetive energetie yonng meu with small eapital who will take hold of "outside" enterprises with an energy and a will that takes no note of hard work, dull times or personal isolation; but who will rest perfeetly satisfied with a legitimato and moderate reward of industry.

Many of the readers of the Scientific Press are loeated in mountainous distriets where more attention given to dairying and gardening would add to the eomfort and eheapness of living, and we think it not amiss to present in our columns some facts ahout California dairyiug, and an illustratiou of

A Cheese Dairy House.

Tho plan here shown consists of a huild- 1½ stories high, with a broad spreading roof of 45° piteh. The ground plan is 10 feet high hetween joists, and the posts 16 high. An ice house may be plaeed at one end (if wished). A wood shed is plaeed at the other eud.

The huildiug is supposed to be ereeted near the milking sheds of the farm and iu eontiguity to the feeding troughs of the cows, or the piggery and adapted to the convenience of feeding.

Interior Arrangements.

The frout door is protected by a light poreh, *a*. Entering hy a door, *b*, the main dairy room, tho cheese presses *c*, *c*, occupying the left end of room, hetween which a passage leads through a door, *l*, into the wood shed, *h*, open on all sides, with its roof resting on four posts set in the ground. Tho large eheese table, *d*, stands on the opposite end. In the eeuter of the room is a chimney, *e*, with a whey and a water boiler and vats on eaeh side. A flight of stairs, *f*, leading into the storage room above is iu the rear. A door, *b*, on the extreme right, leads into the ice house, *g*.

There are four windows to the room, two on each eide, front and rear. In the ioft are plaeed the shelves for storing tho eheese as soon as snffieiently prepared on the temporary table below. This loft is thoroughly ventilated hy windows, and the heat of the sun npon it ripons the cheeso rapidly for market. A trap door through the floors over whieh is hung a taekle admits the cheeso from helow, or passes it down when prepared for the market.

The cheese honse should he placed on a sloping bauk when it is designed to feed the whey to pigs, and even when it is fed to eows it is more eonvenient it to pass to them on a lower level, than to earry it out in bnckets. It may however, if on level ground, be diseharged into vats in a eellar below and pumped out as wanted. A cellar is eouvenient, indeed almost indispensable, under the eheese dairy, and water should be so noar as to he easily pumped or drawn into the vats and kettles used in ruuning up the curd or for washing tho utensils used in the work.

When the milk is kept over night for the next morning's curd, temporary tables may be placed near the ice room to hold the pans or tubs in whieh it may be set and the ice nsed to temper the milk to a proper dogree for raising the cream if the dairy be of sueh extent as to reqnire larger aeeomodation than the plan here suggested a room or two can be added.

The Wheeler Expedition has concluded its scientific exploratious throughout California, Nevada, Utah and Arizona, and the officers are now in this city *en-route* to Washingtou.

Useful Information.

Advantaoes of Crying.—A French physician is out in a long dissertation on the advantages of crying and groaning in general, and especially during surgical operations. He eontends that groaning and crying are two grand operations by which nature allays angnish; and those patients who give way to their natural feelings more speedily recover from accidents and operations than those who suppose it unworthy a man to betray such symptoms of cowardice as either to groan or cry. He tells of a man who reduced his pulse from one hundred and twenty-six to sixty, in the course of a few hours, by giving full vent to his emotions. If people are at all unhappy about anything, let them go into their rooms and comfort themselves with a loud boo hoo, and they will feel a hundred per cent. better afterward.

In accordance with the above, the crying of children should not be too greatly discouraged. If it is systematically repressed, the result may be St. Vitus' dance, epileptic fits, or some other disease of the nervous system. What is natural is useful; and nothing can be more natural than the crying of children when anything occurs to give them either physical or mental pain.

Eating Without an Appetite.—It is wrong to eat without an appetite, for it shows that there is no gastric juice in the stomach, and that nature does not need food; and not needing it, there being no fluid to receive and act upon it, it remains there only to putrify, the very thought of which should be sufficient to deter any man from eating without an appetite for the remainder of his life. If a tonic is taken to whet the appetite, it is a mistaken course, for its only result is to cause one to eat more when already an amount has been eaten beyond what the gastric juice supply is able to prepare.

The object to be attained is a larger supply of gastric jnice, not a larger supply of food, and whatever fails to accomplish that essential object, fails to have any efficiency toward the cure of dyspeptic diseases. The formation of gastric juice is directly proportioned to the wear and tear of the system, which is to be the means of supplying, and this wear and tear can only take place as the result of exercise. The efficient remedy for dyspepsia is work—outdoor work—beneficial and successful in direct proportion as it is agreeable, interesting and profitable.—*Hall's Journal of Health.*

Bad Effect of Hair Restorers.—A correspondent of the *Country Gentleman* says that he has under his care two invalid ladies. "One has been paralyzed on the right side for nearly three years, and has been utterly helpless most of that time. Her vision has been very imperfect; her knowledge of past events has utterly departed from her; recently she appears to be recovering her recollection, and can count with tolerable accuracy as high as twenty." He attributes her prostration entirely to the use of a popular hair restorer. "The other case is not so bad, but bad enough. For the past year her eyes have been an occasion of constant torture. The retina has become so sensitive to the light as to make a dark room indispensable. Wheels of burning flame revolve constantly before her eyes, attended by lightning-like flashes, which are terrible to hear. She is another victim to the poisonous lead contained in the same popular hair-restorer."

Chemical Experiments.—Most persons have an idea that it requires a great deal of expensive apparatus to show or perform chemical experiments. Such, however, is not the case; a great many pleasing and instructive experiments can be shown without any more apparatus than can generally be found in every dwelling. And with the addition of a few glass tubes of various diameters, a dozen or two test-tubes, a pint flask or two, and an assortment of ordinary glass bottles and corks, there is scarcely an experiment that may not be attempted with fair prospect of success. In order to make bell glasses it is only necessary to cut the bottom out of bottles, and grind the surface of the incision.

Curious Facts.—A curious observer has discovered that men and boys invariably run the heels of their boots and shoes over outwardly, while women and girls always run theirs over inwardly. Out of one hundred and forty-seven men and boys that passed the observer at a given point, this fact was true in every instance; out of sixty-seven women that passed, it was true in every instance but one.

Good Health.

Deterioration in Milk in Feeding Bottles.—Prof. Gunning, the Government Analyst at Amsterdam, writes: I object to the infants' bottles in all instances where any part of them is composed of caontchoue or india-rubber, or any like material. There is nothing so ill suited to the constitntion of the human body as the material in question. When, in consequence of suction, the pores of the caontchoue are enlarged, some portion of the milk always remains behind in them, which cannot, or at least cannot without great difficulty, be moved. This milk quickly becomes bad, and spoils the fresh milk with which it comes in contact. The caoutchouc material in question is made up of several ingredients. White zinc, or white lead, is very commonly employed, which is very poisonous. My objections are not founded exclusively upon *a priori* conclusions. In this country many fatal cases have happened among infants, which on solid grounds may be ascribed to the use of these bottles."

If some enterprising inventor will give the world a substitute for rubber, he will confer a great favor and make money beside.

Throat Diseases are so prevalent at this time that we commend to our friends a new remedy which is fully described in a late number of the *Pacific Medical Journal*. It is bisulphite of soda, in large and continuous doses. Diptheria, inflammation of the tonsils, and quinsy through local exhibitions, have their source in poisonous fermentations of the blood, the same as scarlet fever and other zymotic diseases. It is held that the salt prescribed enters into the circulation and retards putrefactive fermentation. Dr. Tyrell failed of success when he administered it in small doses and in three-hour intervals; but when he gave thirty-grain doses every hour, day and night, so as to saturate tho system with the salt, he was almost invariably successful in removing all the severe symptoms in twenty-four hours. The object of publication is to induce physicians to give this medicine a trial, that the curative effects may have more extended proofs.

Keeping Fruit in our Rooms.—We should be chary of keeping ripe fruit in our sitting-rooms, and especially beware of laying it about a sick chamber for any length of time. That complaint which some people make about a faint sensation in the presence of fruit, is not fanciful—they may be really affected hy it; for two continental chemists have shown that from the moment of plucking, apples, cherries, currants, and other fruits, are snbject to incessant transformation. At first, they absorb oxygen, thus robbing the surrounding air of its vital element. Then they evolve carbonic acid, and this in far greater volume than the purer gas is absorbed, so that we have poison given us in the place of pure air, with compound interest. Temperature affects the rate of changes, warmth accelerating it.—*Good Health.*

Pumpkins for Inflammatory Rheumatism.—At a recent meeting of the New York Farmer's Club, a correspondent wrote of the virtues of pumpkin, giving the following instance of its value for inflammatory rheumatism: A woman's arm was swelled to an enormous size and painfully inflamed. A poultice was made of stewed pumpkins, which was renewed every fifteen minutes, and in a short time produced a perfect cure. The fever drawn out by the poultice made them extremely offensive, as they were taken off. I know a man cured of inflammation of the bowels by the same kind of application.

How to Treat a Sty.—The sty is a small boil protruding from the eyelid. It will usnally pass away of itself, but its cure may be hastened by applying a warm poultice of bread and water in a small linen bag. Apply three or four times a day, and each time foment the eye with warm milk and water.

Drinking at Meals.—In the use of liquids as of solid food, desire is the best guide. We should drink when we are thirsty, and as we are usually thirsty at meals, especially when our food contains little water, we should drink with freedom, and usually to the full extent of the desire.

RAILROAD ITEMS.

Pacifi The Northe Railway Company has been incorporated. Its purpose is to build a railroad from Sancelito, Marin county, through said county and Sonoma county, to a point on the Walhalla river, a distance of 90 miles.

Trains upon the California and Oregon Railroad are running into Red Bluff.

Grading upon the Virginia and Truckee Railroad is being pushed ahead vigorously between Washoe and Carson. An extra force has been put to work on the two tunnels near the head of Washoe valley.

The Central Pacific has taken possession of the Stockton and Visalia and Stockton and Copporopolis railroads.

The tracklayers on the road south of the Merced river are making satisfactory progress. The cars are now running to a point but a few miles from and within sight of Bear creek.

The Hood surveying party, which has been laying out the line of the California and Oregon Railroad near the line dividing the two States, have returned, being forced by the snow storms to cease operations. When they quit operations they had advanced a distance of about 20 miles into Oregon.

Although the surveys have been made for a railroad from Napa Junction to Petaluma, to connect with the Sonoma Railroad, and work was actually commenced, the change of ownership of the California Pacific stopped movements in that direction. There are assurances for stating that the Sonoma connection will be made in time for moving the next year's crops. Recently the engineers of the Central Pacific railroad company have been running lines from the Summit, two or three miles above the Junction, across the tules toward Petaluma, with the purpose, it is stated, of looking a route through to Sancelito.

At the meeting of the Board of Directors of the San Diego & Los Angeles Railroad Company, it was resolved that a survey be made with a view to the permanent location of the route from San Diego to Los Angelos. Mr. Chas. J. Fox will act as Chief Engineer of the surveying expedition. The party will commence the survey at Old Town and working toward Pawn, from thence toward San Luis Rey and Santa Margareta to San Juan Capistrano and Anaheim, finally terminating at Los Angeles. The route for a branch from Anaheim to San Bernardino will also be surveyed. From all we can gather the San Diego & Los Angelos Railroad Company means business.

The Bakersville *Courier* rejoices in anticipation of the early connection of Kern county with the balance of the State by rail. It has information of a character which leads it to believe "that the extension of the San Joaquin Valley Road to that place early in the Spring is a certainty.

The Supervisors of Marin county have passed an order calling for an election, to be held on January 24th next, at which time the people will vote whether or not the county shall issue bonds to the amount of $160,000 in aid of building a railroad from San Rafael to Tomales. The North Pacific Coast Railroad Company who design to construct a road from Sancelito to the Walhalla river, by the way of San Rafael and Tomales, have signified a desire to accept of such a subsidy, and will build the road if the County Supervisors can agree with them on the route to be followed.

The object of the road is mainly to open up to the San Francisco market greater facilities in obtaining lumber from the Northern Coast counties.

The Central and Southern Pacific Railroad Companies are about to commence very extensive improvements in the southern part of San Francisco and on Mission Bay. The Central Company has a grant of sixty acres of land in Mission Bay, which, it is said, can be made available at a cost of about 700,000. It is further reported that a contract for filling in that part of Mission Bay covered by the grant has been entered into already. By the terms of the grant, the Company will be obliged to expend the sum of $200,000 on the work before March 21st, 1873.

The new track now being built between San Leandro and Melrose (Simpson's, Alameda county), is progressing rapidly—a train of construction cars has been lately employed in transportating large quantities of railroad iron. The road is completed about half the distance. When finished the old track between these two places will be removed.

The San Joaquin *Republican* says a large number of (four or five hundred) men are employed in grading the track for the branch road the Central Pacific Company are building from the main trunk on the west side of the river down the valley. The branch will leave the main road about three and a half miles west of Banta's, and follow the most direct route down the valley. The town of Antioch will not be the water terminus. The road will pass some three miles to the west of that place and reach deep water at a point below.

Hazlett's surveying party, of the Southern Pacific Narrow-gauge Railroad, returning from the survey of the route to Needles, below Hardyville, on the Colorado, the present terminus of the road, have arrived at Camp Cody, all well. They find a good, practicable route to the Colorado.

The surveying and locating of the Walla Walla and Columbia River Railroad has been completed. A considerable amount of the grading will be done this winter. It is expected that the road will be in running order within a year.

The surveying party under Capt. Maxwell has been ordered to Pend'Oreilee Lake, to make surveys during the winter.

—Gen. Sprague, T. B. Morris and E. S. Smith have gone to Puget Sound, and the Kalama *Beacon* says their visit is supposed to be connected with the location of the terminus, between Olympia and Steilacoom.

The track is laid and construction trains are running on the line nearly eighteen miles, extending five miles and a half beyond Kidder's Camp, up the Cowlitz. A side track has been put down opposite Freeport. The material for the Toutle river bridge is being transported up the Cowlitz by steamer; and as every part of the bridge is ready to be put together, its completion is but the work of a few days.

The Oregon and California Railroad has been graded to a point 60 miles above Eugene City, in the Umpqua Valley. The track is laid but 14 miles above Eugene, and cannot be extended further until a new supply of iron arrives.

Col. Martin, Engineer Northern Pacific Railroad, has just completed a survey up Fish creek, in Montana. The line, as run, has a grade of 105 feet to the mile. This route is said to be 50 miles shorter than the Lou Lou Fork route.

The Burgess party, who have been surveying a route for the Northern Pacific Railroad through the Pipestone Pass, state that this route will be some 50 miles shorter than that by the Deer Lodge Pass.

A suit is in progress at Omaha between the Union Pacific Company and T. C. Durant, to compel the latter to deliver to the railroad company about one million dollars' worth of property deeded to him by individuals in trust for the railroad company in 1863 and 1864.

Work on the western division of the Colorado Central is progressing rapidly. The road-bed is graded ready for the iron to station 275, at Huntsman's Ranch, and it is in a forward state of completion to station 375. The large force now employed between station 335 and Elk Meadow, at Elk creek, brings the working parties within four and a half miles of the Forks, where they will commence operations on or about the first of February.

The work of pushing the Atlantic and Pacific Railroad westward is progressing at a rate hardly surpassed by the operations which characterized the building of the Union Pacific, a few years ago. Already the line is completed to Vinite, 35 miles west of the Missouri line.

The final survey has been made on the Iowa Pacific Railroad, and the route is better in all respects than that surveyed before. The work will probably be completed on the road in Ida county this year, and east of Fort Dodge it is progressing so rapidly that the whole line from Wells to Fort Dodge will be graded by spring.

At a recent special election, Gonzales county, Texas, voted to take $200,000, and Caldwell county, $159,000, in bonds of the Western Texas and Pacific Railroad.

The Manufacture of Platinum.—As an item worthy of record amongst our mechanical news, we would notice the establishment in our country of a new manufacturing industry, namely, that of the manufacture from the raw material of platinum vessels, wire, etc., for the use of the chemist, and of those engaged in technical pursuits. For our supply of these materials we have been, until the establishment of this enterprise, entirely dependent on European makers. The establishment is now successfully conducted in New York by Mr. H. M. Raynor, and we wish the undertaking all success.—*Franklin Institute Journal.*

OLD QUICKSILVER FLASKS.—We can inform C. S., Utah, that one firm in San Francisco pays 50 cents each for second-hand flasks. We should think it economy for many mine owners to return them to this city.

Post Office Changes.

Followiug are the Postal chauges in the Pacific States and Territories during the week ending Decemher 30, 1871.

POST OFFICES ESTANLISHED.–Hot Spring, Siskiyou county, California — George Townsend, Postmaster; Mount Fairview, San Diego county, California — B. F. Jones, Postmaster; Schellbourne, White Pine county, Nevada—Melchoir D. Raum, Postmaster; Woodburu, Marion county, Oregon—Adolphus Mathiot, Postmaster.

POSTMASTERS APPOINTED. — Caliotoga, Napa county, California—William P. Litten; Ellsworth, Nye county, Nevada—P. O. Tyler; Hiko, Lincoln county, Nevada —Charles G. Heath; Rock Creek, Owyhee county, Idaho—J. S. Delavan; Rocky Bar, Alturas county, Idaho—Warren P. Callahan.

DISCONTINUED.—Port Orchard, Kitsap county, Washington Territory.

NAME CHANGED.—Emmaville, Salt Lake county, Utah, to Granite City, aud Joseph J. Snell appointed Poetmaster.

DUTY ON QUICKSILVER.—A concurrent resolution has been offered in the Assembly by Mr. Everett, asking the influence of our Representatives in Congress to aid in eecuring the aholition of the duty on quickeilver. This resolution will surely find favor among all classes interested, and should be adopted. This neceeeary article ie used so very extensively not only for milling purposes, hut also among manufacturers, etc., that it should be hrought within easy reach of all at moderate prices, especially since we on this coast use more of it than any other part of the world.

ON FILE.—Letter from C. H. S.; Communication from C. S.

The State Geological Survey.—No. 2.

In our last week's iseue we made some general remarke upon the character of the Geological Survey, the purposes for which it wae instituted, and what may legitimately he expected from it. These remarks might easily have been extended to far greater length, showing how hroad and complex is the field which falls within the proper scope of such a work, aud how difficult are many of the problems with which it has to deal.

But our space would not permit it. For the eame reasou also, in reviewing what hae already been doue we cannot attempt any detailed history of the work from its inception down to the present time; but after a brief notice of the most important publications of the survey prior to its stoppage hy the Legislature of 1867–8, we shall pase rapidly on to the work of the last two years, of which our account will he eomewhat more detailed. Those who desire fuller information must be referred to the puhlished volumes of the report, and to the printed hieuuial letters of the State Geologist to the Governor, giving detailed reports of the progress of the work year after year.

Earlier Publications.

The first published volume of the report was issued in 1864, and formed a portion of the Paleontology, heing devoted to a descriptiou of the invertehrate fossils helonging to the formatione lower than the tertiary. It was finely illustrated with platee engraved on steel and etone, the text being the work of Messrs. Meek & Gahb. It is an important portion of the work, eince the fossils found in the rocks form the only sure and certain guide hy which to solve the intricate question of the relative ages of the rocke. But it possesses little interest to the general reader.

The next publication was a volume of the Geological Series proper, issued in 1865, and entitled a "Report of Progress and Synopsie of the field-work from 1860 to 1864." This volume consists of about 500 royal-octavo pages of handsomely printed text, profusely illustrated with geological soctious, and sketches of our grander mountain scenery, and crowded with valuahle geological facts and data from almost every portion of the State. It ought to he placed in the hauds of every intelligent miner throughout the State.

The next publication was a second volume of the Paleontology in 1867, to which the same remark will apply as to the first.

In 1867 also, was published the topographioal "Map of the Region adjacent to the Bay of San Francisco" on a scale of two miles to the inch, and covering an area about 88 miles long by 66 miles wide, whioh is nearly equivalent to the comhined areas of the two States of Connecticut and Rhode Islaud. This was the first really accurate map ever puhlished of auy considerable portion of California, and is to-day the finest topographical map yet published of any equal area of mountainous country in the Uuited States. We now pass to

The Work of the Last Two Years.

On the resumption of the work hy the last Legislature, the "Map of Central Califoroia" was one of the first and most important matters which engrossed atteution. This magnificent topographical map, if the means are furnished to oomplete it, will not only be an honor to the State, but its practical value for all time to come, will only grow more apparent year by year. Its scale is six miles to one inch. It embraces the central portion of the State from Owen's Lake and Visalia on the south to Lassen's Peak on the north, aud from Bodega Bay ou the west to Cerro Gordo on the east. It is iu four sheets, each twenty-four inches square, and covere an area of about eighty thousand square miles, of which, however, about eighteen thousand, in the northeastern portion of the map, are within the State of Nevada.

It covers ahout one-third of the whole area, and probably ninety-five per cent. of the population of the State of California.

The southwestern quarter of this map was already in the hande of the engraver. For the purpose of completing the sonth eastern qnarter, a party was fitted out to explore aud map the Inyo and White Mountain ranges and the region south of Mono Lake. Thie party consisted of Mr. C. F. Hoffman, topographer, Mr. Alfred Craven, assistant topographer, Mr. W. A. Goodyear, geologist, and Mr. Chester Averill barometrical observer. They took the field on the 20th of April 1870, and proceeded to Owen's Valley crossing tho Sierras by Walker's Pass. After working up the topography and geology of the Inyo aud White Mountain ranges, the region south of Mono Lake was explored aud mapped.

They then proceeded to Aurora where Prof. Whitney joined them, and together they surveyed the country arouud and to the west of that place, and about the heads of the East and West Walker including a portion of the Sierra hetween the heads of the Stanislaus, the Tuolumne and the Walker.

This whole trip occupied four months. Meantime Mr. Wackenreuder was al o iu the field engaged in mapping a portion of the High Sierra. And later in the season Messre. Craven and Goodyear, with two assistants spent three monthe in mapping, and working up the oomplex hut extremely interesting geology of the region in the Coast Rango exteuding from the head of Napa Valley northwesterly some distance into the higher mountains heyond Clear Lake.

From the field-work previously done hy the survey in the northern Sierra, and from the maps of western Nevada furniehed without, expense to the survey and in advance of their puhlication, by Mr. C. King, Chief of the U. S. Fortieth Parallel Survey, the means are in hand for the completion of the northeast quarter of the map. To furnish the meane of completing this map, it only remains thon to work up the topography and geology of ahout oue-third the area of the northwestern quarter, *i. e.*, a strip in the Coast Range northwest of Clear Lake, and a portion of Tehama county, which will require a party in the field eome three or four monthe. The beautiful engraving of this map, which is of necessity a slow and costly work, is already almost half done, and if the means are furnished the whole thing can he completed, the engraving finished, and the map a puhlished fact within the next two years. It ie proposed to publish two editions of this map, one as a splendid topographical and geographical map, and the other as a geological map on which the different geological formations will he accurately laid down. Moreover, the geological field-work for this map is heing done simultaneously with the topographical work so that as soon as the map is finished, it will only remain to color the geology upon it, and publish the descriptive volumes, which can then be quickly done.

Few people have any adequate conception of the amount of labor involved in the productiou of such a map; hut every one who travels in the mountains can appreciate its practical value when once it is completed. It would he a great lose to California not to have this map completed and published.

Ornithology.

We must not omit to mention one other publication of the survey. The first volume of the "Ornithology of California," devoted to the land birde of the State, made its appearance in tho spring of 1871. This beautiful volume is finely printed, and illustrated with 662 eugravings on wood aud copper. The plan of these illustrations is as follows. Each species, over three hundred in all—has a life-size figure of ite head colored from the life, by hand, while full length portraite illustrate the general appearance of some one representative of each genus, to which are also added diagrams carefully drawn, and executed in relief on copper by the "Jewett Process," which exhibit tho minute detaile of the external anatomy. This is by far the handsomest volume yet published by the Survey. The coloring of the engravings is finely and delicately executed. It forms a most elegant etandard work, and should be found in every gentleman's library.

In our next we shall have something to say of another, and extremely interesting department of the Survey-work.

Table of Altitudes.

The following list of altitudes above the eea-level, which has heen furnished us for publication, by Mr. W. A. Goodyear, Assistant Geologist, will doubtlese be interesting to many of our readers. The localities named are most of them in the region between the North aud Middle Forks of the American river. The determiuations were made with the harometer by the State Geological Survey during the summer of 1871. The results are not absolutely exact; but most of them will be found very near the truth, and acourate enough for practical purposes:

	Feet above level of the sea.
Colfax	2,421
Toll-house at Rice's Bar, North Fork of American River	1,146
Parker House, Iowa Hill	2,867
Summit of 1st Sugar Loaf, Iowa Hill	3,084
Mr. Teasland'e House, Wiscousiu Hill	2,880
Highest crest of Ridge between Elizabeth Hill and King's Hill	3,065
Crest of main ridgo betweeu Iowa Hill and Damascus, just southwest of head of Green Valley Gorge	4,139
Hotel at Damascus	4,016
Crest of main ridge immediately south of Damascus	4,691
Mouth of Humbug Canon, south branch of North Fork, American River	2,051
Fork's House, on ridge, south of Damascus	4,789
Crest of ridge betweeu Forks House and Hog's Back	5,468
Secret House	5,486
Summit of Secret Hill	6,651
Yank's Cabin, Cauada Hill	6,229
Northwest summit of Cauada Hill, Bald Mountain	7,179
Miller's Defeat	5,812
Last Chauce	4,545
Bottom of Canon of North Fork of Middle Fork of Americau River, on trail beteweu Last Chauce and Deadwood	2,719
Crest of ridge near the Devil's Basin	4,390
Hotel at Deadwood	3,943
Bottom of El Dorado Canon, on trail from Deadwood to Michigan Bluff	1,821
Express office, Michigan Bluff	3,488
Bottom of Volcano Canon, on road from Michigan Bluff to Bath	2,871
Forest House, Forest Hill	3,230
Martin B. Tubb's Saloon, Yaukee Jim's.	2,574
Todd's Valley	2,730
Ford's Bar, at mouth of Otter Creek, on Middle Fork of American River	795

The Last Storm.

We have heen visited, siuce our last issue, hy another storm, which set in on Sunday uight and continued with very little intermission for about thirty-six hours. A large amount of water fell during that time, and the rain was very general throughout the State, as far south as Visalia. We append the total of rainfall iu several localitiee, the excess of which, over our last week's report, shows the amount received during this storm:

Napa, to December 29th	26.99
Vallejo, to January 8th	19.30
San Rafael, to " 9th	38.35
Stockton, to " 8th	15.17
Sacramento, to " 8th	14.33
San Francisco, to Jan. 9th	24.60
Shasta, to Jan. 5th	50.14
Oakland, to " 9th	23.18
Woodland, to " 9th	20.10
Petaluma, to " 9th	23.45
Visalia, to " 9th	6.15

This storm in the mountains has also heen unusually severe and attended with a very large amount of rainfall. Lake Tahoe has risen 22 inches notwithstanding its large outlet. The average depth of snow on the eastern Summit of the Sierras is said to be about seven feet, and about one foot on the western slope. Some considerable damago has heen done to dams and ditchee in the mountains; but not so much as might have been expected.

Home Industries.

Carriage Spring Manufactory.

Among the number of our manufactures which have withstood the pressure incident to the opening of the Pacific R. R., and now in successful operation in this city, may be mentioned the enterprise of Wm. M. Betts & Bro. These gentlemen commenced the manufacture of springs of all kinds, from largest locomotive to the lighest carriage spring, nearly four years ago. They have recently erected a building 40x80, at 218 Fremont St. opposite the Fulton Foundry, provided with all the necessary furnaces for tempering, drawing and forging, (two of each kind) together with grindstones, emery wheels and all other appliances for the proper prosecution of the work.

The best steel for the purpose is consigned to the firm of Nelson & Doble from Firth & Son, Sheffield, England, coming in bars of the required width and thickness. Being cut into suitable lengths, the sections are then forged, punched, slotted and fitted. After which they are ground, polished, put together and thoroughly tested by lever purchase, when they are prepared for the market. The number of hands at present employed is fourteen. Besides a gold medal received at the Mechanic's Fair, they exhibit testimonials from the leading carriage makers of this city and coast in commendation of their work. They have filled a number of large orders for car springs from the Central Pacific Railroad Co. In short, they claim to manufacture a spring, unsurpassed in make, shape or temper, by any imported or otherwise.

The Occidental Foundry

Is the name of another establishment recently opened in this city at 137 and 139 First street, on the old stand of the Vulcan Foundry. It is owned and conducted by Messrs. Steiger & Boland, who bring into the new enterprise an experience in the business of some twenty years on this Coast. Many of the best moulders formerly associated with them, have again found employment. We understand also that the former foreman of the pattern department of the Vulcan Iron Works is to have charge of the designs and patterns for the new firm.

For the main foundry a new building has taken the place of the old, which is said to be as large, and as well arranged in all its internal workings as any of the kind in the city, while its advantages for proper ingress and egress are all that could be desired; the whole building running back from First street 137½ feet to W. T. Garratt's Brass Works, with a frontage of 57 feet on Natoma street. Everything has been provided to make it a first-class custom foundry—their motto being "promptness and neatness in the execution of all orders." Of the work on hand, we noticed some large kettles and tanks for the San Francisco Assaying and Refining Works. Retorts and a variety of other manufactured articles for two of our principal sugar refineries (the Bay and the California), a good display of different kinds of implements for the San Francisco Screw and Bolt Works of Phelps Bros., Drumm street; sundry sections of pump machinery for David Stoddart's Machine Works, as also a choice collection of cones, swedge blocks and tweer irons manufactured for the Glasgow Metal and Iron Works Co., Fremont street, together with a quantity of milling and mining machinery, for this city and the interior.

Safety Fuse Manufactory.

It may not be generally known that a manufactory of this kind exists in this State. Our correspondent, L. P. Mc., furnishes us with the following: There are three such establishments in the State, the principal one of which is situated two miles southeast of Alameda, and about twelve miles from San Francisco, and is known as the branch works of Toy, Bickford & Co., the original works being at Hartford, Connecticut, and were started thirty-five years ago. The works near Alameda are run by an engine of 35 horse power, and were started five years since. The greater part of the fuse used on this Coast is now manufactured at this establishment, and their capacity is sufficient to supply the entire demand. Twelve men are regularly employed.

Oregon Stoves.

The Oregon Iron Works some time since commenced the manufacture of stoves, of which they are turning out a very fine article, and averaging about a dozen a day. They make two patterns of cooking stoves, three parlor, two box, one cylinder; and have sent for other patterns. There is some boldness in this movement, says the Willamett *Farmer*, as it requires a permanent investment of about seventy-five thousand dollars to carry on the work. The present indications are that the company will find this a profitable branch of their business.

Hints to Miners.—No. 6.

Formation of Deep Placers—Continued.

As a rule, auriferous alluvia are found deposited in or near the present drainage courses, except in such instances as the following:

1. Where the old valley beds have been silted up to high levels forming wide alluvial flats, as illustrated in Fig. 5, in which *a* is the water channel; *b* wash dirt and *c* wash dirt. In this case the run of gold may be found at a considerable distance from the existing water-channel, although in the same flat or valley. This deviation seems to have been caused by the creek undergoing a constant change across the valley during the process of silting up by fluviatile action, as indicated by the alternate layers of sand, shingle and clay forming the deposits.

Fig. V.

2. It is sometimes found that the old drainage beds containing alluvial deposits of gold, after being silted up to a considerable hight, as described above, have been subsequently made to assume the form of hill ridges by the erosion of newer and deeper valley beds on each side of them, as shown in Fig. 2, where *a* represents the modern water course, *b* the wash dirt and *c* the modern water course. A well-known hill in Victoria presents a notable example of this sort, as it shows on the outside the appearance of an ordinary clay-slate spur; but it consists chiefly of deposits of sand, shingle, and clay; and alluvial gold in considerable quantities has been found in it from time to time directly under the present summit.

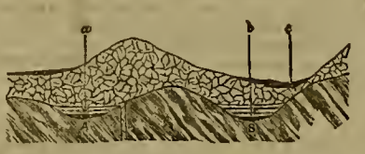
Fig. VI.

3. Again, where the silurian claystones, etc., have been wholly or partly capped by flows of basalt, the existing water courses or lines of drainage often differ very much in direction from the older valleys beneath them, but conform to them so far as the general direction of the drainage from the dividing ranges to the sea coast or principal rivers is concerned. Figs. 7 and 8 are examples of this kind of change.

Fig. 7 in which *a* and *b* are wash dirt and *c* the existing water course, represents a tract of country wholly covered with basalt, upon which new lines of drainage have been worn out, conformable to the depressions and slopes of the newer surface, and under which deep leads of gold often occur, occupying the position of the older valleys as at *A* and *B*.

In Fig. 8, *a* and *c* are the wash dirt and *b* and *d* the existing water course. This figure shows a flow of basalt originally confined to the bed of an old alluvial valley of the older sedimentary rocks, supposed to have been bounded on each side by hills, as shown by the dotted lines; but the basalt, from its indurated character, being much more impervious to the decomposing and wearing action of the atmospheric elements than the adjacent claystone rocks, newer valley beds at a much lower level have been eroded on each

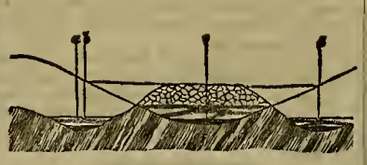
Fig. VII.



side, and the original level of the surface reduced, leaving the old valley capped by the harder rock to appear as a small elevated plateau. This formation may be observed in many places where the flows of basalt have been confined to narrow channels.

4. But reverting to the hill deposits of surfacing which have been alluded to, they appear to specially illustrate the extraordinary changes that have taken place in the drainage courses formed in the older sedimentary rocks by the ordinary agencies that are now in operation. The opinion entertained by most miners to account

Fig. VIII.



for shallow auriferous deposits on the hill, is, that they are of more recent date than the gold in the drifts of the valleys, and are the results of a later disintegration of rich quartz veins in their immediate vicinity, which has caused the gold to lodge on the slopes of the hills directly under these veins. This view may be correct with regard to those surface deposits of gold which do not lie directly upon the bedrock; but it does not appear to be so in this instance, as they are found in immediate contact with the silurian strata, and the water course character of the gold and quartz detritus indicates that they have been subjected to the same friction and disturbance as the shingle and gravel drifts of the valleys.

Careless Blasting.—We have had to record in our list of mining accidents this week two different ones that recently happened, both from the same cause, that of going back to a faulty blast before it was time. When a shot does not go off properly, it is only after the utmost precautions have been taken and a proper delay, that miners should approach the spot. Shots have been known to go off fully ten minutes after they had been lighted. Numbers of dreadful accidents have happened in consequence of too great haste on the part of the miner in his anxiety to return to his post, to draw the charge. In many districts in Europe this is not allowed; there new holes have to be made. If no such rule exists here, there should be some regulations made by superintendents as to the length of time employés should wait before returning to the hole. Accidents from this cause are of so frequent occurence that there should be some preventive applied at once.

James C. Conroy, the senior member of the firm of Couroy & O'Connor, a well-known house in this city, died at his residence in San Rafael on Tuesday.

Patents & Inventions.

Full List of U. S. Patents Issued to Pacific Coast Inventors.

[From Official Reports to Dewey & Co., U. S. and Foreign Patent Agents, and Publishers of the Scientific Press.]

For the Week Ending December 26.

Saw Collar.—Frank A. Huntington, San Francisco, Cal.

Shingle Machine.—Frank A. Huntington, San Francisco, Cal.

Lamp.—Emil Boesch, San Francisco, Cal.

Note.—Copies of U. S. and Foreign Patents furnished by Dewey & Co., in the shortest time possible by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with greater security and in much less time than by any other agency.

Report of the Sutro Tunnel Commission.—The report of the Sutro Tunnel Commission was transmitted to the Senate on the 9th inst. The Commissioners report that the tunnel is entirely feasible and may be constructed in less than two and a half years at a cost of about $4,500,000. They believe that the Comstock is a true fissure vein, continuing downwards indefinitely, and express an opinion that, while the tunnel is not a necessity for ventilation or drainage, yet any scheme which promises increased economy in the working of the mines and rendering valuable a vast amount of now worthless low grade ores in the Comstock lode, becomes of national importance. Whether the Sutro Tunnel project will fulfil this condition of economy, depends upon the efficacy of the methods now employed in Germany and other countries of Europe for the concentration and profitable working of low grade ores. On this point the Commissioner has not in this country by personal investigation been able to obtain the desired information. In conclusion, the report commends the Sutro Tunnel to favorable consideration as an exploring work for deep mining.

Mining Sales.—It is reported that the Lexington mine in Little Cottonwood Cañon, U. T., has been sold to S. G. Phillips of London for $75,000. The former owners were Messrs. Connor, Moore, Pierson and Laurence.

The Prussian Hill mine near Railroad Flat, Calaveras Co., is also reported sold to a San Francisco Co.

The Santa Maria mine, Cerro Gordo District, Inyo Co., has been sold by the sheriff in execution for $100,041 to satisfy judgment for $97,000, the purchaser being P. W. Bennet. The Inyo *Independent* thinks that Mr. Dorr, the former owner, will redeem the property.

The Jackson *Ledger* says that a report is current in the neighborhood that two important sales of quartz mines have been affected to an English Co. The mines are the Kennedy, near Jackson, for $150,000, and the Amador, or Hayward mine, at Sutter at $300 per share, aggregating for the last named mine the sum of $1,140,000.

Original and Solid.—Contrary to ordinary custom, much of the original matter in the Press is not solid, in order to give the readers as much information as possible. Hence some of our neighbors have often failed to give us credit in copying original articles. For instance, we find the Humboldt *Register* crediting our article "Sage Brush as a Fertilizer" to the Reese River *Reveille*. Written for us by a very intelligent and observing lady, it was probably taken by the *Reveille* without credit. We have forehorn noticing such instances heretofore, although we frequently meet with them, preferring to see our articles traveling abroad, without credit, rather than staying at home. We are aware that such things are sometimes the result of inadvertence, as we have learned in our own experience. Probably this might have been such a case. We simply rise to explain—that's all.

W. R. Eckart, C. E., recently returned to San Francisco from the East. Mr. E. happened to be one of the snow-bound passengers delayed on the U. P. R. R. He suggests the plan of elevating the snow and conveying and discharging it at a suitable distance from the track by use of two conveying screws placed one on each side of the locomotive, the forward ends approaching each other in V form so as to receive snow from a properly shaped snow-plow. The screws to be worked by connection with the engine.

Domestic Economy.

How to Make a Coal Fire.

The art of making and maintaining a coal fire properly is possessed by but few. We believe that there would be a sensible diminution in the number of domestic quarrels and soured tempers, if a knowledge of it were more general. Husbands would not have to growl and scold over so many late dinners, nor wives fret themselves to skin and bone over obstinate fires that will neither bake, roast, nor boil.

There are many faults in the usual construction of a coal fire. A common fault is to use too coarse wood for kindling, and too much of it. This, while it generally succeeds in lighting the coal, leaves a bed of ashes below the coal which interferes with the draft unless raked out. The wood should be of some rapidly burning variety which gives a quick and high heat, and should be split fine. It should be so placed that the coal will remain on the top of it and not fall through to the grate, leaving the kindling on the top of any part of the coal. A good rule, where stoves or furnaces have a good draft, is to use coal as small as can be used without inconvenience from its sifting too freely through the grate.

Grates should have their bars closely set for stoves that are cleaned out daily, and have fires lighted in them each morning, while those which are intended to have fires kept in them continuously for days and weeks will not admit of fine grates, on account of the accumulation of ashes and small "clinkers."

There is much difference in coal in regard to the formation of clinkers. These are nothing but vitrified, or partially vitrified earthy matters, and only can form when a high heat is maintained; they are apt to be troublesome when there is too great a draft. A coal stove or furnace should, therefore, be so constructed that its draft can be perfectly controlled. The bottom draft should admit of being closed air-tight, as nearly as is possible to make it, and there ought always be provision made for a top draft. If, however, the draft of a chimney should be so strong that air in too great quantities is drawn in at the bottom when the dampers are closed, a damper in the pipe, which will close it partially, must be employed, though in sluggish chimneys such a damper is apt to force the gases of combustion into the room, and therefore it ought always to be avoided when possible.

The practice of putting ashes on the top of a fire to keep it, is very productive of clinkers, although it answers very well in other respects. Damp coal screenings are better, and may be economically burned in this manner. If a coal fire gets very low, the quickest way to extinguish it is to rake it at the bottom. To preserve a fire under such circumstances, a little coal should be placed on the fire, and when it has caught, more may be added, and the raking deferred until it has got well ignited. When the fire bricks have become hardened with clinkers which have fused and adhered, they may be cleaned by throwing oyster or clam shells into the fire box when the fire is very hot, and allowing the fire to go out. The clinkers will generally cleave off without the use of much force the next morning. From two quarts to one-half a peck will be sufficient for most stoves, and the operation can be repeated if some of the clinkers still adhere.

Water-Proof Boot Soles.

If hot tar is applied to boot soles, it will make them water-proof. Let it be as hot as leather will bear without injury, applied with a swab, and drying in the fire. The operation may be repeated two or three times during the winter, if necessary. It makes the surface of the leather quite hard, so that it wears longer, as well as keeps the water out. It is a good plan to provide boots for winter during the summer, and prepare the soles by tarring, as they will then become, before they are wanted to wear, almost as firm as horn, and wear twice as long as those unprepared.

Ten years ago, says a correspondent of the *Country Gentleman*, I met with a direction similar to the above, and with some hesitation I concluded to have it tried on the soles of a pair of field boots. By a piece of superarrogance, a pair of thin-soled morocco boots was tarred with the others, the soles being saturated and the seaming too, all round, including the lower rim of the morocco all round the soles. As these boots are doing service yet, and have been much used every summer during the ten years, I mention the fact because it furnishes what I then wished for, namely, a proof that the tar would not burn or otherwise hurt the leather. The soles remain like horn, and have never required any repair, and even the thin upper apparently cracked in all directions from the first, has never torn but a little on one boot, at the bend on the outer side of the foot. It has been oiled but once each summer, but the soles received only the one thorough tarring. Boot soles will take the tar best after having the grain worn off slightly. It soon dries in, if exposed to the sun, and the odor, even of gas tar, is quickly overcome by the all conquering effects of dry earth. A short walk over a fallow field will remove it completely, and make it entirely unnecessary to imitate the eastern custom of taking off the boots at the house entrance, unless there be some other reason for it than fresh tarred soles.

Out Door Cellar.—In the first place, select the most elevated spot of ground conveniently near to your dwelling house and throw out the dirt to the depth of two feet. Build a double brick wall at the base of the excavation, leaving a vacant space of six inches, between the walls, which should be tied at the corners and several places in the sides, being careful, however, to leave vacant places for vent holes, to admit a free circulation of air throughout the length and breadth of the walls. The hight of the walls when completed, nine feet from base to top. The surplus dirt, banked up, ou outside four feet in hight. Floor overhead, two thicknes of well seasoned, matched flooring, and cover the whole with good shingles; construct a flue exteuding upwards and at the top of the building, to allow impure air to escape. A drain should be constructed by which any water which might penetrate, would run off. Of course a proper floor should be constructed for the cellar.

A correspondent of the *Prairie Farmer* says he has used such cellars for upwards of twelve years and ever found them sure depositories for fruits and vegetables in winter, and for milk, butter, etc., in summer.

Mechanical Hints.

Many mechanics complain of inability to set a machine to be driven at right angles from the line or counter-shaft, without continual trouble with friction from the shifter on the belt, and the slipping of the belt to the tight or loose pulley. The operation is a simple one, and just as effectual as to drive in a direct perpendicular or horizontal. Take the center of tho off or contributing side of your drive pulley and drop from it a plummet; let this line decide the center and perpendicular of the side of the tight and loose pullies which takes your belt at a right angle below. Unless your eye is accustomed to the angles which are given to the appearance of the belt, from either side, you will condemn the position without trying, but if you are careful to get an exact perpendicular in the manner described there can be no mistake.—*Am. Manufacturer.*

To Improve Woods.—An ingenious Frenchman has invented a process for treating common woods, which makes them of a closer texture, harder grain, and greater density, and so enables the cheaper kinds of wood to take a polish. The mode is as follows: The surface is first planed perfectly smooth, and then rubbed with diluted nitrous acid. An ounce and a half of dragon's blood, dissolved in half a pint of spirits of wine, and half an ounce of carbonate of soda are mixed together and filtered; and the liquid is then laid on the wood with a soft brush. The treatment should be repeated after a short interval, and the wood will then possess the outward appearance of mahogany. If the polish is not sufficiently brilliant, rubbing with cold drawn linseed oil will improve it.

White Lines in Cabinet Work.—The Chinese are supposed to use a combination of rice gluten and fresh shell lime in their inimitable white work; indeed, they use rice paste made by pounding boiled rice into a sticky mass, for a great number of purposes. Rice, when pounded as above, with a little plaster of Paris, is a capital substance for inlaying. In Europe, isinglass, dissolved in a strong white spirit, and any pale coloring ingredient added, constitutes artificial ivory. The dust of ivory, bone, box, or holly, made up with gelatine into paste, is also used.

JOHN TAYLOR & CO.,

IMPORTERS OF AND DEALERS IN

ASSAYERS' MATERIALS,

Chemical Apparatus and Chemicals,

Druggists' Glassware and Sundries,

PHOTOGRAPHIC GOODS, ETC.,

512 and 514 Washington street, SAN FRANCISCO.

We would call the special attention of Assayers, Chemists, Mining Companies, Milling Companies, Prospectors, etc., to our large and well adapted stock of

ASSAYERS' MATERIALS

—AND—

Chemical Apparatus,

Having been engaged in furnishing these supplies since the first discovery of mines on the Pacific Coast.

WE ENUMERATE IN PART:

Assay Balances—L. Oertlings, London.
Assay Balances—Becker & Sons, Antwerp.
Chemical Balances—Becker & Sons, Antwerp.
Ore or Pulp Balances—Becker & Sons, Antwerp.
Assay Weights—Grains and Grammes.
Bullion Balances and Weights.
Humid Assay Apparatus.
Iron Furnaces—Improved, Lined with Fire Brick for Cupelling and Melting.
Tongs, Muffles, Cupel Moulds, Assay Moulds, Scorifiers, Roasting Dishes, Annealing Cups, French Clay, Assay Crucibles, Hessian or Sand) Crucibles.
Dixon's Celebrated Black Lead Crucibles and Covers—all sizes.
Assayers' and Chemical Glassware and Assayers' Hardware a full assortment.
Steel Stamps for bars cut to order.

ACIDS AND CHEMICALS.

Acid in carboys and bottles, commercially and chemically pure.
Bi Carb Soda, Borax, Bone Ashes, Litharge.
Assay Lead in bars, rolled and granulated.
Black Oxide Manganese, Sodium and Sodium Amalgam, Sulphate of Copper, Quicksilver, and all Chemicals and Reagents required by Assayers and Milling Co.'s.

☞ Our Gold and Silver Tables, showing the value per ounce Troy at different degrees of fineness, and valuable tables for computation of assays in Grains and Grammes, will be sent upon application.

24v23-tf JOHN TAYLOR & CO.

THE CALIFORNIA

Safety Gas Lamp.

This New Gas Lamp takes the place of the Candle, the Coal Oil Lamp and Coal Gas, and costs only

One-Half Cent per Hour.

Any person who will take the trouble to examine this Lamp carefully, will see that it will not explode.

The flame is as white and brilliant as coal gas, and produces neither Smoke nor Smell. No Chimney is Required.

It makes its own gas as fast as it is required, and when the light is blown out the gas ceases to be generated.

One Burner is Equal to Six Candles.

This Lamp burns Refined Petroleum, Gasoline, Danforth's Oil or Taylor's Safety Fluid. Oil expressly prepared for the Lamp furnished by the undersigned in quantities to suit. WIESTER & CO.,
17 New Montgomery street, Grand Hotel, S. F.

J. R. ANDREWS,

SUCCESSOR TO

F. MANSELL & CO.,

House and Sign Painters,

412 PINE STREET, SAN FRANCISCO,

Three doors above Montgomery st.

F. MANSELL still superintends the Fancy and Ornamental Sign Work.

Country Orders Attended to

With Punctuality, Cheapness and Dispatch.

26v23-3m-bp

Mechanics' Institute.

Entrance 27 Post Street (bet. Kearny and Montgomery), SAN FRANCISCO.

The Library of Reference, the Library, Reading Room and Chess Room are open from 8 A.M. until 10 P.M. every day, (except Sundays and Legal Holidays).

The Society possesses a Library of 18,000 volumes—the most valuable technical and scientific library on the Coast, embracing the transactions of the leading Scientific Societies of the United States and Europe, (among which are the philosophical transactions of the Royal Society of Great Britain, complete), and the standard, scientific and technical works; and is in immediate receipt of all new standards publications.

The Reading Room is supplied with the current periodicals and newspapers of the day.

The Mechanics' Institute is open to all, and the Trustees will be pleased to have visitors and others inspect the Rooms.

Entrance Fee, $1.00. Quarterly Dues (in advance) $1.50. Life Membership, $50.

VICK'S

FLORAL GUIDE FOR 1872.

Over One Hundred Pages,

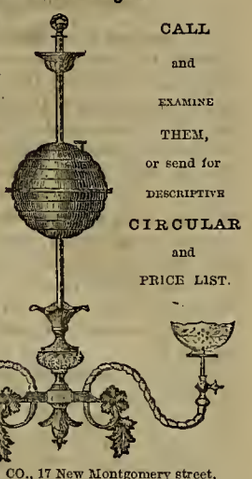
Printed in Two Colors, on superb Tinted Paper. Four Hundred Engravings of Flowers, Plants and Vegetables, with Descriptions, and

TWO COLORED PLATES.

Directions and plans for making Walks, Lawns, Gardens, etc. The handsomest and best FLORAL GUIDE in the World. All for Ten Cents, to those who think of buying Seeds. Not a quarter the cost. 200,000 sold of 1871. Address JAMES VICK,
22v23 Rochester, N. Y.

New Gas Light.

GAS LAMPS of EVERY DESCRIPTION, with the Latest Improved BURNERS.



CALL and EXAMINE THEM, or send for DESCRIPTIVE CIRCULAR and PRICE LIST.

WIESTER & CO., 17 New Montgomery street, no25-sa (Grand Hotel), San Francisco.

Longshore's Combination Tool.

This device is just what its name indicates. As a Kitchen Tool it is indispensable It will fit and lift with perfect safety, any Stove Lid, Frying Pan, Pie Pan, Pot, Kettle, or any other vessel or dish used about a stove. It is a complete tool for stretching carpets, driving tacks, pulling tacks, &c., &c. It answers the double purpose of hammer and pincers, and is also a good Nut Cracker. It is made of the best malleable iron, and the Hammer, Pincers and tack puller, are all hardened so as to stand the roughest usage. An Agent is wanted in every town on the Pacific Coast to sell this valuable little implement. Retail price fifty cents.

WIESTER & CO.,
17 New Montgomery street (Grand Hotel),
San Francisco.

READ THIS.

A POLISHING AND FLUTING IRON that should be in every house in California. It flutes collars, cuffs and ruffles of every description, without injury to the finest fabrics. As a Polishing Iron it cannot be excelled, being made of the best material and highly polished. The fluting of the Iron is made of finely polished brass, which adds much to the beauty as well as the utility of the article. We want a few good agents and will be pleased to receive communications from persons who mean business. WIESTER & CO.,
17 New Montgomery st. (Grand Hotel), S. F.

THE

Gutta Percha and Rubber Manufacturing COMPANY.

109 California street, San Francisco.

Patent Combination Carbolized Steam Fire Hose, Steam and Petroleum Oil Hose,

Suction Hose, Hydrant Hose, Conducting Hose, Engine Hose, Round Packing, Rubber Belting, Packing, Valves, Caskets, Pure Vulcanized Sheet Rubber, Fire Buckets.

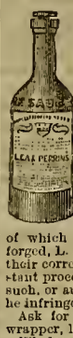
The California Powder Works
No. 314 CALIFORNIA STREET,
SAN FRANCISCO.
Manufacturers and have constantly on hand
SPORTING,
MINING,
And BLASTING
POWDER,
Of SUPERIOR QUALITY, FRESH FROM THE MILLS. It being constantly received and transported into the interior, is delivered to the consumer within a few days of the time of its manufacture, and is in every way superior to any other Powder in Market.
We have been awarded successively
Three Gold Medals
By the MECHANICS' INSTITUTE and the STATE AGRICULTURAL SOCIETY for the superiority of our products over all others.
We also call attention to our
HERCULES POWDER,
Which combines all the force of other strong explosive now in use, and the lifting force of the BEST BLASTING POWDER, thus making it vastly superior to any other compound now in use.
A circular containing a full description of this Powder can be obtained on application to our Office.
16v20-3m JOHN F. LOINE, Secretary.

LEA & PERRINS'
CELEBRATED
Worcestershire Sauce.



Declared by Connoisseurs to be the only good Sauce. The success of this most delicious and unrivalled Condiment having caused certain dealers to apply the name of "Worcestershire Sauce" to their own inferior compounds, the public is hereby informed that the only way to secure the genuine is to ASK FOR LEA & PERRINS' SAUCE, and see that their names are upon the wrapper, labels, stopper and bottle.
Some of the foreign markets having been supplied with a spurious Worcestershire sauce, upon the wrapper and labels of which the names of Lea and Perrins have been forged, L. and P. give notice that they have furnished their correspondents with power of attorney to take instant proceedings against manufacturers and vendors of such, or any other imitations by which their right may be infringed.
Ask for LEA & PERRINS' Sauce and see name on wrapper, label, bottle and stopper
Wholesale and for export by the Proprietors, Worcester; Crosse & Blackwell, London, &c., &c., and by Grocers and Oilmen universally. Agents, CROSS & CO., San Francisco. 1v22-1yeow

UNION PACIFIC RAILROAD.

Running from Ogden, Utah, to Omaha, Nebraska—over one thousand miles, without change of cars.
MAKING DIRECT CONNECTIONS
AT OGDEN with the CENTRAL PACIFIC R. R. (from San Francisco); also with the Utah Central R. R. to Salt Lake City.
AT CHEYENNE with the DENVER PACIFIC R. R., for Denver City and the Mining Districts of Colorado.
AT OMAHA, for Chicago, Eastern and other cities, with the Chicago and Northwestern; Chicago, Rock Island and Pacific; Burlington and Missouri River; St. Joseph and Council Bluffs Railroads; also, for St. Louis and all Southern cities.
EXPRESS TRAINS RUN DAILY.—The U. P. R. R. use the Westinghouse patent air brake; Miller's patent trussed platform and elastic car-coupler; and the most approved construction of cars for the comfort and safety of passengers.
PULLMAN'S MOST MAGNIFICENT PALACE SLEEPING CARS attached to express trains.
T. L. KIMBALL,
General Passenger Agent, Omaha.

LUBRICATING OIL,
THE BEST IN THE WORLD!
The attention of the public is called to GRUBER'S NEW PATENT LUBRICATING OIL.
For running Machinery of all kinds it has no equal.
It will not gum, and runs perfectly smooth, cool and clean.
This OIL offers special inducements to Farmers, Livery Stable Keepers, etc.
It will be found far Superior
To any other Oil or Grease now in use, for Carriages Wagons, and all kinds of Farming Machinery.
Mill-men, Printers, and all others having occasion to use a Lubricator, will find a decided advantage in using this Oil—one gallon being equal to two of the best Oil in the market.
Perfect Satisfaction Guaranteed
OR MONEY REFUNDED.
Orders per Mail or Express will receive prompt attention.

Mining Accidents.

Edwin Edmonds, a miner in the Idaho mine, was killed by a cave in the shaft, on the 4th inst. Deceased was well known and much esteemed in Grass Valley.

Daniel Schneider recently fell a distance of 20 feet in the Uniou mine, Cerro Gordo, and besides breaking a rib, sustaiued au injury of the spine which has nearly paralyzed his lower limbs.

John Kasher, an employee on the Kansas lode, Nevada, while passing over an old shaft, which was temporarily covered for convenience of stoping in its vicinity, fell, by reason of the planking being insecure, a distance of 60 feet, He struck some obstruction at 20 feet which turned him over and when taken from the bottom it was found that he had fractured his skull and received a number of flesh wounds on his body. It is believed that his injuries will not prove fatal.

An Italian by the name of J. Camari employed in the Gwin mine, Calaveras county, was severely cut and bruised about the head and face, a week since, by the explosion of a blast which hung fire, and which Camari was re-adjusting.

Another accident occurred at the Yellow Jacket mine, in which Samuel Holden working in the 1,100-foot level, was severely injured. Both these latter accidents were from the same cause. The blasts did not go off when they shonld have done so, and the miners went to them for the purpose of seeing what was the matter, when they exploded and hurt the men.

A Winter Musk-melon.

In tbe issne of the Scientific Press of December 3d, 1870, reference was made to a new and singular melon which Mr. R. Marchella, of Oroville, has raised the previous season. They were the only specimens of the kind which had ever been raised in the State, or probably in America, and were the product of about 100 seeds, which bad beeu obtained at much cost and tronble, from some portion of Turkey. The botauical name of tbe melon is given as *Buchiri*. One of these melons has been left at this office where it was cut and devoured. It was plucked from the vine some three months previously, bnt was as sound and perfect as the day on which it was picked, and to all appearance might have been kept for several months longer. The appearance of the melon differs but little from those of the ordinary growtb, except that the skiu is a little darker aud bard, like that of a winter squasb, a fact to which is probably chiefly due its keeping quality. If bung up in a dry and cool place, we are informed, it may be kept good the year round. The taste was of a slightly nutmeg flavor; but with the specimen we tried was not as rich as some of the ordinary melons. Its peculiarity aud great value consists in tbe fact that it will furnisb a genuine and very good musk-melon for the table the year rounnd; as such it is invaluable, and will no doubt be largely sought for.

A year ago the seed conld not have been purchased for love or money—the entire first year's crop being reserved for the importer's own use and propagation. Tbe seeds are for sale at this office.

These melons are for sale by Geo. Hugbes, No. 315 Washingtou street.

With 1872

Commences volnme XXIV of the Scientific Press. Its life of ncarly 12 years, we verily believe, bas saved more to the Pacific States, and imparted more profitable and practical knowledge to porsonal readers tban any other journal in this new and still developing field. We wish to increase our usefulness. We want more subscribers added to our already large list. The publication of such a first-class paper is expensive. We shall make the Press worthy of donble its present circulation this year.

Every old snbscriber who can feel the value to himself and the commuuity of a journal that seeks its patronage through articles instructive, elovating, and interesting, and without trasb or sensation, we earnestly solicit to renew bis own subscription and to speak a good word for the Press to others. Tbe commencemont of a new year and volume is a good time to

Send Us Your Subscriptions.

Jan. 1, 1872.

Forest Destruction.—It is estimated that at the present rate of destruction tbat uot one of the forest pines will remain in either Wiscousin or Michigan in 30 years from this time.

The Best Varieties of Grapes.

At the meeting of the Grape Growers' Association, held at Napa, on the 16th ult., a paper was read by Dr. Lockwood, from the Committe on vines, on the best varieties for vineyard planting. The varieties recommended by the Committee were pure black grapes, Zenfridel and Black Malvoise ; pure white grapes, the Golden Arapelas and Boyer ; pure musk grapes, the Rhenish Muscat. These were commended for their productiveness, although Rieslings would he entitled to the first place, if their good bearing qualities were satisfactorily established.

In response to an inquiry, Mr. Baufetou stated his Grey Rieslings averaged 15 pounds to the vine.

Dr. Crane has found that Rieslings were abundant bearers when trained high. Without high training they were shy bearers. The weight of fruit on a single vine—an exception, of course—thus trained, has hy careful estimate heen placed at 70 pounds. Not only is the Riesling a good bearer, bnt the superior quality of its product gives it special value. He had found, in the East, no difficulty in selling Riesling wine, when that from Missiou grapes was neglected.

Mr. Krug would confine his selection to a very limited variety, naming as his favorites the Rieslings (Schaumherg and Frankling), the Zenfridel and Muscatel. He was aware that these would not suit all localities. Thus Rieslings did not prosper in Sonoma. Mr. Craig confirmed Mr. K's statement of the unsuitahleness of Rieslings to Sonoma. His Riesling vines, trained on stakes, suffered from wind-blast and yielded badly. Col. Walton had no success with his Rieslings while he pursued the practice of low training and short spurs. He now reserves three canes to be tied together at the upper extremities. The increase over his former treatment is 600 per cent. He trains some other varieties (Chepelas, Muscats, etc.) in the same way.

Mr. Harazthy deprecated the especial attention paid to varieties without any consideration of the different qualities of soil. Planting should be done with reference to the adaptation of soils, to produce the qualities of wine desired. At Stockton, wines partook of the character of Port and Madeira. At St. Helena, Claret was indicated by depth of color.

A Trespass Law Wanted.

The following resolutiou was adopted by the Couvention :

Resolved, That this Association earnestly recommend the immediate attention of the Legislature to the Trespass law, already memoralized for, and that the Association invite their special attention to the remedy necessary to carry into effect the proposed law ; that the remedy by action in the courts of justice of this State is not satisfactory, and that a system of pounds, aud the impounding of estrays should he estahlished in each county, dividing the same into districts.

Our Tule Land Levees.

A difference of opinion exists in regard to the stability of the levees uow finished or in course of construction around the delta islands of the Sacramento and San Joaquin rivers. Of course everything depends upon the hight and strength of snch levees; mere hight, without sufficient width of both base and top, will not afford the security desired. Nor nnder certain circumstances will botb of these suffice.

Unless these levees are secured against impinging waters, caused by the natural, rapid flow of tbe rivers, or the washings of tbe waves from passing steamers, their endurance is yet problematical. At the present season of high water the rivers are more thau bank full, with the backing np of the tides, the steamer wave passing freely over that portiou of land between the river hank aud levee is doing considerable damage to a portion of the levee on the east of Grand Island by washing away its base.

This might be almost entirely prevented by setting out and growiug a thick copse of willows on tbe strip of land between the river bank and tbe levee. If more land was given to such border by building the levee further back from tbe river, it would afford far greater security, at the same time that the land could be mado to pay a good per cent. upon its value, in the simple production of willows or other woods for fnel. If tho yellow or golden willow of the Eastern States is not already introdnced here, it sbould be at once, being the most valuable willow for river bank protection in the world.

Pecan Nuts in Texas.—The pecan trees in San Antonio county, Texas, were reported as breaking down with fruit. The crop in that immediate section, it was thought, would bring over one million of dollars; the nuts selling at $2.50 per bushel. The crop in Lonisiana is reported at 25 per cent. over that of last year.

The Five Per-Cent. Law.—In the Senate, Jan. 9th, the bill to repeal this obnoxious law came np, and without debate was passed by the following vote: Ayes, 30; Noes, 7. Senator Duffy gave notice that he sbould move for a reconsideratiou, but it will be quite nseless. The voice of the people throngh the press, has removed the odious law from our statutes.

Sacramento.

[By T. M. Logan, M. D., Secretary State Board of Health.

Jan. 1, 1872. Rainfall for the season to date..12.421 inches
" 10, " " " ...3.030 "

Total for the season up to Jan 10, 1872.....15.451 inchs.

Remarks.—The succession of southeast storms, which set in on the 17th of Dec., last, appears at last to have exhausted themselves, leaving our plains deluged and an ample supply of water impounded on our mountain summits, in the form of snow. At all events the indications, at the present writing, are favorable for clear weather. Wind N. W. and barometer steadily rising.

San Francisco Metal Market.

[Corrected weekly by Hooker & Co., 117 and 119 Cal. street.]

Mining Companies

Should advertise their Meetings, Assessments, and Sales, in the Scientific Press. Rates more than one-half less than daily publications. Stockholders should take the hint and request their managers to truly economize by advertising in a Mining Journal, where all notices may be seen by cheaply purchasing and examining a weekly. You will thus save money and uphold a journal which upholds your interests.

Our Agents.

Our Friends can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

Wm. F. Spencer—California.
W. H. Murray—General Traveling Agent.
C. H. Winnelle—Special Corresponding Agent.
I. N. Hoag—Sacramento, General Agent.
F. M. Shaw—San Diego.
L. P. McCarty—California.
M. B. Starr—Pacific Coast.
A. C. Knox, City Soliciting and Collecting Agent.

COMPLETE VOLUMES

Of the Scientific Press can he had from Jauuary 1, 1864, to date, at $3 per single vol. or $6 a year. They afford the cbeapest and best information on mining and the industry of this coast of any work published.

FOR 25 CENTS we will send, postpaid, four sample copies (recent numbers) of the Press. This, we believe, will induce many to subscribe who have not yet read our paper. It is a cheap and valuable favor to send a friend anywhere.

Give Your Old Address when you want the paper sent to a new one. We cannot afford to look over several thousand names to stop it at the former P. O.

MARAVILLA COCOA.—No breakfast table is complete without this delicious beverage. The *Globe* says: "Various importers and manufacturers have attempted to attain a reputation for their prepared Cocoas, but we doubt whether any thorough success had been achieved until Messrs. Taylor Brothers discovered the extraordinary qualities of 'Maravilla' Cocoa. Adapting their perfect system of preparation to this finest of all species of the Theobroma, they have produced an article which supercedes every other Cocoa in the market. Entire solubility, a delicate aroma and a rare concentration of the purest elements of nutrition, distinguish the Maravilla Cocoa above all others. For homœopaths and invalids we could not recommend a more agreeable or valuable beverage." Sold in packets only by all Grocers, of whom also may be had Taylor Brothers, Original Homœopathic Cocoa and Soluble Chocolate Steam Mills—Brick Lane, London. Export Chicory Mills, Bruges, Belgium. fe25-ly

University of California.—The Preparatory Department is under the charge of five Professors of the University, and six tutors.

Besides the studies of the public schools, Algebra, Geometry, Latin, Greek, German, French, Spanish and Book-Keeping are taught.

Terms: Board and tuition, 4 weeks, $30. Students received at any time. George Tait, Oakland, Master Fifth Class. se9bptf

$5 to $20 per Day and no Risk.—Do you want a situation as salesman at or near home to introduce our new 7 strand White Wire Clothes Lines, to last forever. Don't miss this chance. Sample Free. Address Hudson River Wire Works, 75 William street, N. Y., or 1 Dearborn street, Chicago, Ill. 23vl-12mbp

Ladies Desiring to Procure a First-Class Sewing Machine against easy monthly installments may apply to No. 294 Bowery, 157 E. 26th, 477 9th Ave., New York Good work at high prices if desired. 21vl-12mbp

Continental Life Insurance Co., 302 Montgomery street, corner of Pine.

Scientific and Practical Books on Mining, Metallurgy, Etc.

Published or issued, wholesale and retail, by DEWEY & CO., Scientific Press Office, S. F.

BY GUIDO KUSTEL,

Mining Engineer and Metallurgist.

Roasting of Gold and Silver Ores, and the Extraction of their Respective Metals without Quicksilver, 1870.

This rare book on the treatment of gold and silver ores without quicksilver, is liberally illustrated and crammed full of facts. It gives short and concise descriptions of various processes and apparatus employed in this country and in Europe, and explains the why and wherefore.

It contains 142 pages, embracing illustrations of furnaces, implements and working apparatus,

It is a work of great merit, by an author whose reputation is unsurpassed in his speciality.

Price $2.50 coin, or $3 currency, postage free.

Concentration of Ores (of all kinds), including the Chlorination Process for Gold-bearing Sulphurets, Arsenurets, and Gold and Silver Ores generally, with 120 Lithographic Diagrams. 1867.

This work is unequaled by any other published, embracing the subjects treated. Its authority is highly esteemed and regarded by its readers; containing, as it does, much essential information to the Miner, Millman, Metallurgist, and other professional workers in ores and minerals, which cannot be found elsewhere in print. It also abounds throughout with facts and instructions rendered valuable by being clearly rendered together and in simple order. It contains 120 diagrams, illustrating machinery, etc., which alone are of the greatest value. Price, $7.50, postage paid.,

Nevada and California Processes of Silver and Gold Extraction, for general use, and especially for the Mining Public of California and Nevada, with full explanations and directions for all metallurgical operations connected with silver and gold from a preliminary examination of the ore to the final casting of the ingot. Also, a description of the general metallurgy of silver ores. 1864.

As its title indicates, this work gives a wide range of information, applicable to all vein miners and workers in precious metals, affording hints and assistance of exceeding value to both the moderately informed and the most expert operator.

Price, $5 in cloth; $6 in leather—coin.

Mining and Other Companies.

Owing to the time necessary to mail the present large edition of the Scientific Press we are obliged to go to press on Thursday evening—which is the very latest hour we can receive advertisements.

Alhambra Hill Mining Company—Location

of works, Alhambra Hill, Pinto District, White Pine County, Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the 9th day of December, 1871, an assessment (No. 1) of 50 cents per share was levied upon the capital stock of said company, payable in United States gold coin on the 13th day of December, 1871, to Henry G. Langley, 612 Clay street, San Francisco, California. Any stock upon which said assessment shall remain unpaid on the 13th day of January, 1872, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the 5th day of February, 1872, to pay the delinquent assessment, together with costs of advertising and expenses of sale. HENRY G. LANGLEY, Secretary.

Office, No. 612 Clay street, San Francisco, Cal. de16

Caution—Eagle Quicksilver Mining Company—Location

of works, Santa Barbara County, Cal.

Notice is hereby given to the public not to purchase or negotiate for the following named shares, designated by the names of the delinquent owners in the Eagle Quicksilver Mining Company. They were duly advertised and sold in full at public auction, as by law, and the articles of agreement provided, by John Middleton and Son, Auctioneers, on Monday, the 8th day of January, 1872, for delinquent assessments thereon and accruing costs of advertising and expenses of sale, and will not be transferred by said company.

MINERS, ATTENTION!

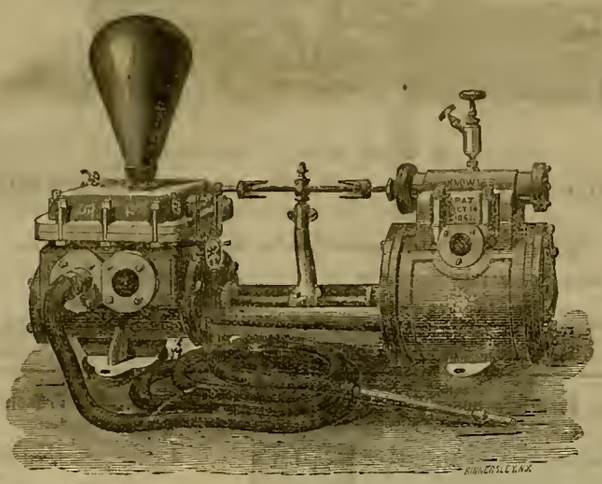
MINERS AND MANUFACTURERS ARE HEREBY cautioned against MAKING, BUYING, SELLING or USING, what is known as R. R. & J. CRAIG'S NEW AND IMPROVED HYDRAULIC JOINT OR NOZZLE, as the same is an infringement upon the invention of the undersigned secured by Letters Patent No. 108,658, dated Oct. 25th, 1870, known as Watson's "Hydraulic Champion," and all parties participating in such infringement will be rigorously prosecuted.

THOMAS WATSON,
Proprietor of Watson's Hydraulic Champion,
Dated Nevada City, Jan. 2d, 1872. 2v24-1m

KNOWLES' PATENT STEAM PUMP.

Awarded First Premium and Diploma

Over all Competitors, at Mechanics' Institute Fair of San Francisco, 1871; also Special Medal and Diploma at State Fair.



It has no Cranks or Fly-Wheel, and has no dead points where it will stop, consequently it is always ready to start without using a starting-bar, and does not require hand-work to get it past the center. Will always start when the steam cylinder is filled with cold water of condensation.

The trial of Steam Pumps at the Eighth Industrial Fair in San Francisco, by a Committee of Five of the most thoroughly practical mechanics on this coast, showed the Knowles Pump to lose but 11⅛ per cent., while others lost as high as 40 per cent., showing great difference in economy.

CENTRAL PACIFIC R. R., OFFICE OF THE GEN'L MASTER MECHANIC,
SACRAMENTO, Cal., April 14, 1871.

A. L. FISH, Esq., Agent of the Knowles' Steam Pump, San Francisco—Dear Sir: In reply to your inquiry as to the merits of the Knowles' Steam Pump, in use upon this road, I will say that we have nineteen of them in use on this road as fire engines, and pumping water for shop and station use. I consider the Knowles Steam Pump the best in use, and prefer it to any other. Yours truly, A. J. STEVENS, General Master Mechanic.

WE BUILD AND HAVE CONSTANTLY ON HAND

THE LARGEST STOCK OF PUMPS IN THE WORLD,

And for Every Conceivable Purpose.

A. L. FISH, Agent.

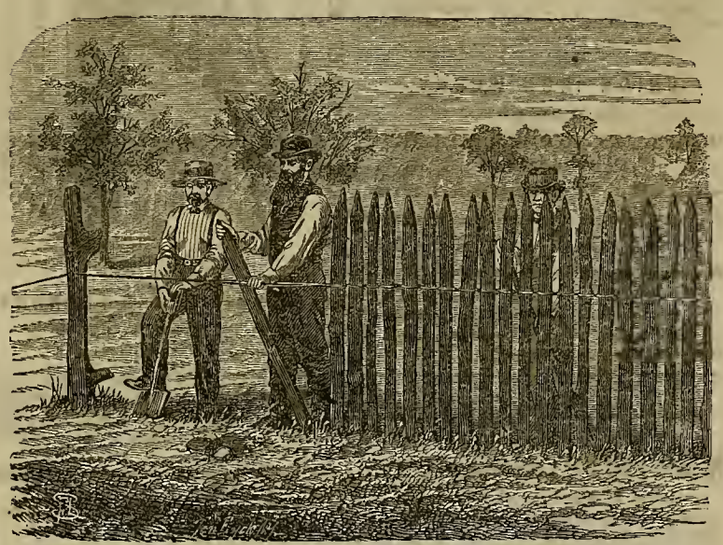
P. DAVIS' WIRE AND PICKET FENCE.



Although about two hundred different styles of fences have been invented and patented in the United States within the past ten years, yet this Fence, for GENERAL FARM USE, stands at the head of the list. This is a Virginia invention, and the actual cost of the Fence complete in that State is less than fifty cents per rod. Three men can put up six hundred yards per day. Price of territory, and circular with full description of fence, sent on application.

WIESTER & CO.,
No. 17 New Montgomery street (under Grand Hotel), San Francisco.

Nevada Consolidated Borax Company---

Location of Works: Columbus and Fish Lake Valleys, Esmeralda County, State of Nevada.

NOTICE.—There are delinquent upon the following described stock, on account of assessment levied on the 29th day of November, 1871, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. of Certificate.	No. of Shares.	Am't.
Charles Myrtetus	15	3571	$178 55
Charles Myrtetus	16	3671	178 55

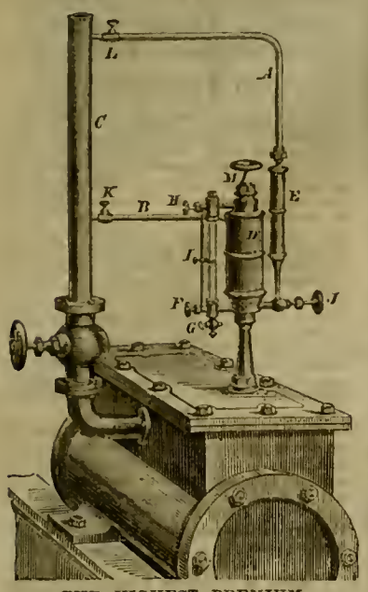
N. Seibert's Eureka Lubricators.



THE HIGHEST PREMIUM

Awarded by the Mechanics' Institute Fair, San Francisco, and State Fair, Sacramento, 1871.

These Lubricators are acknowledged by all engineers to be superior to any they have ever used; feed constantly by pressure of condensed water, supplied by pipe A, regulated under the oil by valve J, and forced out through check valve and pipe B into the steam pipe C; it then becomes greasy steam, passes to all the valves and cylinder at every stroke of the engine; glass tube I indicates amount used per hour. Packing on rods and stems lasts longer, and the rings on the piston will not corrode. One pint of oil will last from three to six days, according to speed and size of engine; I, sliding gauge; K, valve to shut off when engine stopps; H, F, valves to shut off in case of frost; steam does not enter the cup; it is always cool; warranted to give satisfaction. Patented February 14, 1871. Manufactured by California Brass Works, 125 First street, S. F. 24v23tf

HUGHES' PATENT REMOVABLE GLOBE LANTERN.

Since the time when King Alfred made the first lantern by surrounding a candle with a transparent casing of horn, this class of appliances has been one of the greatest utility and most extended use. Among the latest improvements in its construction is that illustrated in the accompanying engravings, and designed to secure the threefold object of providing for the easy cleansing of the glass portion, the secure retention of the upper in place upon the lower part of the lantern, and the affixing of the ball to the top of the lantern in a durable and efficient manner. The base of the lantern is provided with the usual detachable lamp, and at one side has hinged to its upper edge a wire frame designed to carry and protect the glass portion or body of the lantern, and at the upper end of which is the cylindrical top, perforated in the ordinary manner to permit the escape of the products of combustion from the lamp. Arranged at that side of the base opposite the hinge is an angular spring-catch so applied as to catch over the annular lower rim of the wire frame, and in conjunction with the hinge, to hold the said frame firmly in place upon the base as required when the lantern is in use.

This Lantern is offered as

The Best and Most Desirable in Use,

all things considered. Its price is reasonable, and when once tried no other will be accepted.

Individuals, Dealers, Railroad Companies, and all persons and institutions about to purchase Lanterns, should inquire for this kind; and if not for sale in your locality, address the inventor for circular of full description, price list, etc.

Patented August 10 and December 28, 1869, by

JOHN HUGHES.

AMBLER'S BLOWPIPE FURNACE,

For Roasting Rebellious Ores.

This new roasting furnace is the CHEAPEST AND BEST yet offered to the public. By furnishing an ample supply of oxygen to the ore while roasting, thorough oxydization of the sulphurets is secured at a small cost.

It is Adapted to All Kinds of Ores.

A description and illustration of this Furnace was given in the SCIENTIFIC PRESS of November 25th.

For terms, circular, and further information, address the agent of the inventor,

Varney's Patent Amalgamator.

These Machines Stand Unrivaled.

For rapidity pulverizing and amalgamating ores, they have no equal. No effort has been, or will be spared, to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows.

The pan being filled, the motion of the muller forces the pulp, to the center, where it is drawn down through the apperture and between the grinding surfaces.—Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Setlers made on the same principle excel all others They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill-men are invited to examine these pans and setlers for themselves, at the office, 229 Fremont Street, San Francisco.

The Scientific Press for 1872 Still Marching Onward!

Our careful system of compiling, judiciously condensing, and conveniently arranging into regular departments, has been heartily endorsed. It renders the paper worth more to readers, who can find handily that which interests them most. This plan will be continued in Volume XXIV.

The weekly issues of the PRESS will contain reliable

Information for Practical Miners,

Treating on the Opening of Mines; Mining of Ores; Milling of Ores; Smelting of Ores; Separation and Roasting of Ores; Amalgamation; Saving of Gold and all precious Metals; New Processes of Metallurgy; New Discoveries of Mines; Mining Engineering and Hydraulics.

For Inventors, Mechanics and Manufacturers.

All new and important developments in Scientific and Mechanical Progress; Patents and Inventions of the Pacific States; Progress of Home Industries; Hints for Local Manufacturers; Illustrations of New Machinery; Reports of Popular Scientific and Industrial Lectures.

Our Mining Summary

Gives the progress of mining work from week to week in the various counties and districts throughout the principal mining regions of the United States, arranged in alphabetical order. It is the most extensive record of mining operations published in the world. It affords the intelligent miner a rare opportunity to know and profit by the work and experience of his neighbors. Miners have few sources of practical information in their calling, and should embrace every rellable means for improvement. Mining Operators and Shareholders, at home and abroad, weekly examine our Summary with increased interest and profit.

For Self-Improvement,

Every issue of the PRESS abounds with articles of an elevating character, to stimulate the higher virtues and natures and progressive intellects of both men and women.

Our "Domestic Economy"

Embraces new and important facts which should be known in every cabin and household. Short and interesting—the articles under this heading are freely read and practiced with profit and improvement to the readers.

The PRESS is not strictly a "paper for professions, scientific men," but rather a

Liberal and Popular Scientific Journal,

Well calculated to make practically scientific men from our intelligent masses. This is our stronghold for accomplishing good. Plain, correct and pleasing language, easily comprehended by all, confined mostly to short articlee, is our endeavor.

The New and Novel Developments

In the progress of this comparatively new section of the Union (but recently settled and now rapidly increasing with a population of the most intelligent and venturesome people, attracted from nearly every quartcr and clime on the globe), onable us, with due cuterprise, to display vigor and freshness in our columns not met with in similar jonrnals elsewhere. The same circumstances also render such a paper more especially valuable to its readers in a new, and to a certain measure, untried field, where the best methods and processes of industry are not so well established or traditionally known as in older communities. Published experiences often save costly experiments and disastrous results.

Hundreds of Dollars

Are oftentimes saved to the readers of this paper by a single hint or article of information in its columns. Such instances have been repeatedly reported to the sditors and proprietors during their long connection with the PRESS. Onr paper presents

A Great Variety of Industrial Information,

In brief and fresh form, suited to the wants and tastes of the readers of this coast, which is not obtainable otherwise so timely, or in so cheap and convenient form. As an industrial publication, meeting the wants of so many kindred indnstries, this journal stands pre-eminent and without a precedent.

Our community is not so numerons or our field so thickly settled as the Eastern States and Europe, consequently we wish each friend of our enterprise to bear in mind the greater importance of his individual patronage, and also ths value of

DEWEY & CO.,

American and Foreign Patent Agents, Publishers of the Scientific Press, San Francisco.

PATENTS obtained promptly; Caveats filed expeditiously; Patent reissues taken out; Assignments made and recorded in legal form; Copies of Patents and Assignments procured; Examinations of Patents made here and at Washington; Examinations made of Assignments recorded in Washington; Examinations ordered and reported by Telegraph; Rejected cases taken up and Patents obtained; Interfereuces Prosecuted; Opinions rendered regarding the validity of Patents and Assignments; every legitimate branch of Patent Agency Business promptly and thoroughly conducted.

Our intimate knowledge of the various inventions of this coast, and long practice in patent business, enable us to abundantly satisfy our patrons; and our success and business are constantly increasing.

The shrewdest and most experienced Inventors are found among our most steadfast friends and patrons, who fully appreciate our advantages in bringing valuable inventions to the notice of the public through the columns of our widely circulated, first-class journals—thereby facilitating their introduction, sale and popularity.

Foreign Patents.

In addition to American Patents, we secure, with the assistance of co-operative agents, claims in all foreign countries which grant Patents, including Great Britain, France, Belgium, Prussia, Austria, Victoria, Peru, Russia, Spain, British India, Saxony, British Columbia, Canada, Norway, Sweden, Mexico, Victoria, Brazil, Bavaria, Holland, Denmark, Italy, Portugal, Cuba, Roman States, Wurtemberg, New Zealand, New South Wales, Queensland, Tasmania, Brazil, New Grenada, Chile, Argentine Republic, AND EVERY COUNTRY IN THE WORLD where Patents are obtainable.

No models are required in European countries, but the drawings and specifications should be prepared with thoroughness, by able persons who are familiar with the requirements and changes of foreign patent laws—agents who are reliable and permanently established.

Our schedule prices for obtaining foreign patents, in all cases, will always be as low, and in some instances lower, than those of any other responsible agency.

We *can and do* get foreign patents for inventors in the Pacific States from two to six months (according to the location of the country SOONER than any other agents.

Home Counsel.

Our long experience in obtaining patents for Inventors on this Coast has familiarized us with the character of most of the inventious already patented; hence we are frequently able to save our patrons the cost of a fruitless application by pointing them to the same thing already covered by a patent. We are always free to advise applicants of any knowledge we have of previous applications which will interfere with their obtaining a patent.

We invite the acquaintance of all parties connected with inventions and patent right business, believing that the mutual conference of legitimate business and professional men is mutual gain. Parties in doubt in regard to their rights as assignees of patents, or purchasers of patented articles, can often receive advice of importance to them from a short call at our office.

Remittances of money, made by individnal inventors to the Government, sometimes miscarry, and it has repeatedly happened that applicants have not only lost their money, but their inventions also, from this cause and consequent delay. We hold ourselves responsible for all fees entrnsted to onr agency.

The principal portion of the patent business of this coast has been done, and is still being done, through our agency. We are familiar with, and have full records, of all former cases, and can more directly judge of the value and patentability of inventions discovered here than any other agents.

Situated so remote from the seat of government, delays are even more dangerous to the inventors of the Pacific Coast than to applicants in the Eastern States. Valuable patents may be lost by the extra time consumed in transmitting specifications from Eastern agencies back to this coast for the signature of the inventor.

Confidential.

We take great pains to preserve secrecy in all confidential matters, and applicants for patents can rest assured that their communications and business transactions will be held strictly confidential hy us. Circulars free.

Engravings.

We have superior artists in our own office, and all facilities for producing fine and satisfactory illustrations of inventions and machinery, for newspaper, book, circular and other printed illnstrations, and are always ready to assist patrons in bringing their valuable discoveries into practical and profitable nse.

SAN FRANCISCO, SATURDAY, JANUARY 20, 1872.

VOLUME XXIV. Number 3.

Rickey's Improved Bung and Bung Inserter.

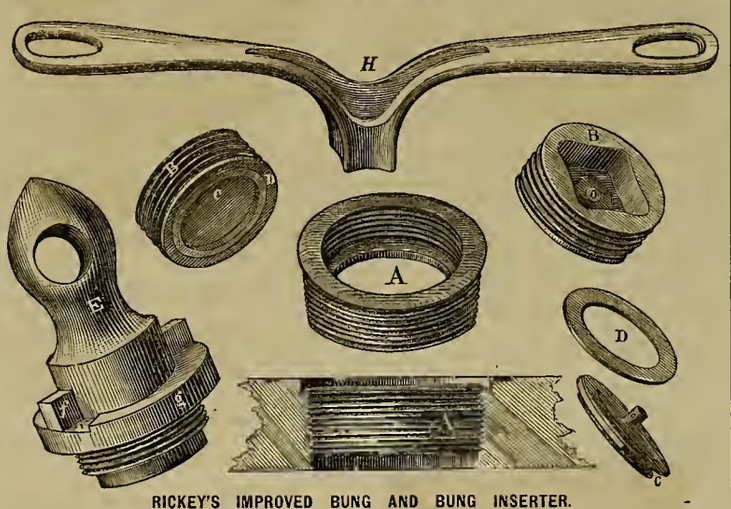
A cheap, convenient and perfectly tight bung has long been a necessity, especially for brewers purposes, where they are liable to leak or be blown out if they are not perfectly fitted and secured. Many different kinds of patent bungs have been offered to the public from time to time, but each of them has been thrown to one side after a short trial as defective or wanting in some particular. The illustration presented herewith represents Rickey's Patent Bung and Bung Inserter, the latter being an instrument devised by Mr. Rickey for screwing the bushing into which the bung or plug fits, into the barrel stave. The bung seems to us to be quite complete and we see no reason why it will not eventually take the place in the market of all others.

By referring to the cuts, it will be seen that the central figure, *A*, is the metallic ring or bushing, which is provided with internal and external screw-threads in the ordinary manner. This ring is made slightly tapering or conical and the threads narrow at the base and quite sharp, so that when it is screwed into a hole of the proper size it will cut its own threads. This may be done by the use of the bung inserter, shown on the left-hand side. The inserter consists of a metal standard, *E*, in the upper end of which is a hole. The base of this standard is made of the same size as the bung and provided with screw threads as shown. Resting upon this base and encircling the standard, *E*, is a ring, *g*, in the upper face of which and opposite each other, are two oppositely inclined depressions, as shown, and passing through the standard so that its opposite ends will rest in these depressions is a bar, *f*.

To use this inserter the base is screwed into the bushing until the ring, *g*, is brought down against the face of the bush. The standard, *E*, is then turned until the ends of the bar, *f*, rest as far as possible up the incline of the depressions. The base is then screwed down until the ring rests upon the face of the bushing. A proper-sized hole having been first made in the barrel stave by means of a bung borer, the bushing is started into it, when, by placing a rod through the hole in the standard as a lever the bushing can be screwed into the hole in the stave until it is snugly down; and when once it has been thus forced down so as to cut its own thread it cannot be started by ordinary means, and will not leak. After the bushing has been firmly screwed down the inserter can be readily removed by turning the standard, *E*, in a reverse direction which causes the bar, *f*, to move to the lowest part of the depression and relieves the pressure on the screw.

In the ordinary bung the washer is merely placed on the projecting seat on the lower end of the bushing and the bung screwed down upon it, thus leaving it free to be washed out every time the barrel is cleansed, and, if left for any length of time the leather becomes hard and adheres both to the seat in the bushing and to the bung so that it is almost impossible to remove the bung. The one illustrated entirely obviates this difficulty and is also provided with more convenient means for being turned. *B* represents a top view of the bung which is cast with a square socket in its upper face, the sides slightly convexed into which the wrench, *H*, is made to fit.

The Fig. marked, *B*, *C*, *D*, shows the bottom of the bung with the disk, *C*, attached by means of the stem as seen at *B*, in the right hand figure. *C* represents a metallic disk, having a projecting flange on its under side around which a groove is turned. The washer (either leather or rubber) is stretched over the lower flange so as to fit in the groove, around the outer edge of the disk and thus be permanently fixed upon it. The stem projecting from



RICKEY'S IMPROVED BUNG AND BUNG INSERTER.

the upper center of this disk passes up through a hole in the bottom of the bung, *B*, as shown, into the socket where a washer is placed over it and it is headed down. By this means the disk is attached to the bottom of the bung so as to revolve independently.

The object of this is to allow the disk and washer, as soon as the washer has touched the seat in the bushing, to remain stationary until the bung is firmly screwed down. When the bung has remained this way any length of time and it is desired to remove it, by unscrewing the bung, the disk and washer will be lifted directly upward by the screws and thus avoid the trouble heretofore experienced on account of its adhesion. *D* represents the washer which is to be stretched into the groove in the disk, and can be made either of leather or rubber as desired.

It will be seen that the bushing, *A*, as shown in the lower cut, sets below the face of the stave. This is done without any preparation of the hole, with the use of but a common bung-borer. The threads of the bushing are sharp, and as said before, the bushing is made slightly tapering, so that by the use of the bung inserter and the leverage obtained by using a bar in the hole in the standard of that tool, the bushing can be screwed down as deep as required.

The importance of this ingenious and useful invention is readily seen when the number of barrels and casks that are used on this coast are taken into consideration, and all made of imported material, causing them to be an expensive article. The wear and tear on barrels is principally on the bung stave, which is always the best stave in the barrel, but nevertheless the first to give out, owing to the difficulty in always finding a bung of the proper size or shape, in consequence of the hole becoming elongated. The wood in the hole presents two different surfaces, one with the grain of the wood at the sides and the other against it. To avoid this it becomes necesssary to frequently bore or burn them out, in order to keep them round. Each operation of this sort necessarily enlarges the hole and weakens the stave, and for this reason the bung in a new barrel is left much too small for convenience. Moreover, if by carelessness or an extra quality of timber the hole is not enlarged by this means, it becomes necessary after awhile to take out the head of the cask to get at the corks that have been driven in.

It will be seen from this that it is difficult to keep these holes of uniform size, and consequently a great variety of different sized bungs are required, and these have to be selected with care for each different barrel, consuming considerable time. These bungs are frequently made of old staves and vary in thickness. The thin ones if a good fit, form a shoulder at the bottom, which, when a thicker one is driven in, is broken and the lower end of the wood around the hole becomes a mass of splinters, rendering it difficult to clean, and liable to leak. The object of the above mentioned improvement is, not only to provide a means that will preserve the bung-stave as long as any other stave in the barrel, but to furnish a safe and reliable bung which will be a great saving of labor. This improvement has been thoroughly tested by all the brewers of San Francisco, and has given general satisfaction. One firm alone in this city, Messrs. Mangels & Co., of the Albany Brewery, have about 1,000 in use, and heartily recommend them. The patent for this device was secured through the SCIENTIFIC PRESS Agency by D. B. Rickey, who may be addressed at No. 111 and 113 Davis street, San Francisco.

A New Stock Board.

The amount of business which has been transacted in mining and other stocks during the past few months in the San Francisco Stock Board and on the streets has been much greater than at any time since its formation. The protracted sessions and heavy business of the old Board has caused considerable dissatisfaction among some of the dealers, who complain that they cannot transact their full business. The meetings of the Board have been necessarily prolonged over the usual time in order to permit the brokers to buy and sell the full amount of their orders. In view of this a number of dealers and brokers convened on Saturday evening last at John Middleton & Son's auction rooms for the purpose of organizing a new Board.

The new organization is to consist of 40 charter members who are to pay an initiation fee of $100 each, and to these may be added at the discretion of the Board, ten special members who are to pay $500 each for that privilege. The name adopted is "The California Stock and Exchange Board." Two meetings are to be held daily—from quarter past 10 to 11 A.M. and from quarter past 2 to 3 P.M. These hours have been chosen so as to permit persons to transact business in the in old Board, which meets after the adjournment of the new one. The price to be paid for placing any stock on the list of the Board is to be $50. With this exception all the rules of the San Francisco Stock Board have been adopted, as they have been found to work well in practice. The following are the 40 charter members:

George W. Ramage, T. J. L. Smiley, John Middleton, E. J. Baldwin, W. W. Lawton, A. Difthat, A. C. Chick, J. F. Crossett, C. Hosmer, B. M Rudsdale, T. J. Poulterer, T. J. Sanborn, F. Wolff, E. L. Smith, R. Broderick, H. S. Logan, E. S. Tibbey, J. McKenty, H. S. Fitch, J. Marina, J. P. Canton, George S. Sorren, M. D. Townsend, W. H. Wright, J. H. Owens, E. J. White, P. H. Phebe, R. T. Kent, Samuel Barrell, Simon Marks, C. A. Kenney, William H. Brown, D. Fay, J. Kloppenstein, W. J. Smith, Samuel Heineman, George Rogers, Charles L. Weller, W. J. Williams, John Harper.

MINERAL DISCOVERIES IN ASIATIC RUSSIA. Mines of extraordinary value are said to have been recently discovered in the province of Semipalatinski, Siberia. Copper mines yielding 60 per cent.; lead mines of 70 per cent.; silver "one-seventh of pure ore" and coal yielding 60 to 90 per cent. of coke are reported.

CORRESPONDENCE.

Mines Near Deer Lodge, M. T.

[By Our Own Traveler.]

Deer Lodge.

This town is the county seat of Deer Lodge county, and is situated in a valley of the same name. A numher of fine huildings have heen erected during the past year, but, like many other towns on this coast its future prosperity scems to depend on the movements of a certain railroad compauy more than on its owu merits. Still, if the inhahitants would place more faith in the really excellent mines in their vicinity and in the advantages thcy possess in having a fine stock range and a country well adapted for agricultural pursuits, in my opinion a railroad would make much less difference to them than they suppose. The Odd Fellows and Masonic Fraternity are well represented here and their lodges are in a flourishing condition. Two weekly papers are published here, the *New North West* and *Independent*, both excellent puhlications and well adapted to the wants of the community. Through first-class tickets are sold from this place to San Francisco for $115, and second-class for $95.

Gold Production.

In this place are two hanking institutions, hoth huying gold dust from the miners. To give you some idea of the production of gold of this country I will furnish you with a few figures, given to me from the hooks of one of these firms, Bolim & Co., of the amount shipped hy them during four months of this year. For the month of June they shipped 118,000 ozs.; July, 219,000; August, 253,000; September, 109,000, making a total of 699,000 ounces. When you take into consideration the fact, that hesides the other bank here, there are a numher of them in Helena only ahout six hours ride from here, which are all buying dust, and that large quantities are carried away by individuals, the grand total of dollars is enormous. The above firm informs me, moreover, that their shipmeuts have fallen off since last year fully 25 per cent. for the reason that a number of the miuers are shipping direct to thc States and a large amount is being invested in improving and developing mining properties.

The Mines.

There are quite a number of mining districts in the vicinity of Deer Lodge within a radius of 50 miles, and the mines are principally placers. The quartz mincs at Phillipsburg are in a flourishing condition and work is heing prosecuted vigorously. The Speckled Trout miue is one of the principal ones, and developments prove it to be a ledge of more than ordinary richness. Captain Plaisted took out of a mine that he was working last winter $24,000, and last fall he leased a 10-stamp mill with six pans, which will work ores from the Alta and other minee in the district. The process of reducing hase metal ores hy dry crushing, roasting with ealt and barrel amalgamation, has been practically proved a success in this District, and the per cent. of the assayed value of the raw ores saved by mills working free ores.

Pioneer City

Is situated hut a few hours ride from Deer Lodge. It is a flourishing placer mining camp containing four large groceries, two hotels, a good school, two breweries, etc. The gold taken out in the camp is worth from $18.50 to $19 per ounce. Near the city are located many valuable claim; the first I vieitcd was one known as the Pioneer, owned hy Thomas & Bros, 2,400 feet on the bar and 1,500 feet wide. They have two pipes runuing night and day. They clean up weekly from $1,000 to $5,000. The mining ceason laets here from about the 15th of April to November. They have cleaned during the last season in the neighborhood of $60,000. Twelve hands are employed.

A short distance from this is another good claim owned by R. S. Kelly, J. S. Pemberton, and S. Gibhone. The gravel banks vary from 6 to 18 feet in depth and the gold is very coarse. The claim pays handsomely. The property of this claim is three-fourths of a mile long aud 800 feet wide. They uee gum hose, 5 inches in diameter, which will stand a pressure of 200 pounds. These two companies are the two leading ones of the place. A few miles distant is

Yam Hill,

Which is located betweeu Pike's Peak and Pioneer city, and is a very rich camp. The waters furnished to the miners is sold at 25 cents per inch for first head, and 15 cents second head. The miners complain of the high price and say that if it was reduced to 12½ cents per inch it would put three times as many men at work in the diggings during the mining season as there are now. Near Yam Hill is a place called

Pilgrim Bar.

On this bar is a claim owned by Wm. Roes, from which $50,000 were taken out in August, and in September $46,000 (currency). This will give you some idea of the value of the placer mines in the vicinity. There are a numher of other

Mining Localities,

Scattered in different directions throughout this section, all of which seem to he prospering. At the Henderson Gulch a number of men are at work, some of them averaging as high as from $12 to $20 per day to the hand. French Gulch and Fenian Gulch are hoth furnishing their quota to the bullion product of the country. Independence Gulch also contains some good mining ground. The Cable City mines are producing a goodly quantity of "dust." The claims at the Race Track mines are turning out well; they, like most of the others are worked by hydraulic process, hut the expeuse of water is a serious drawback.

Remarkable Succession of Floods.

How To Prevent Destruction by Floods.

It is a notable fact that, for the past sixty years, commencing with 1812, and concluding with the present year, this continent has heen regularly visited by deluging floods about every tenth year. Iu the winter of 1811-12 the valley of the Mississippi was flooded to such au extent that hoats losing the channel, were drifted into the interior and stranded upon plantations, many miles away from the river. In 1822, ten years later, this coast was visited by the greatest deluge ever known here. In 1832 the valleys of the Ohio and Mississippi were visited by another memorable flood—in fact the waters of the Ohio, at that time, rose to a point never attained since. At the same time the Pacifice coast was deluged, hut not to such an extent as in 1822.

In 1842-'52-'62 and now in 1872 these pluvial visitations have occurred invariably at the close, or rather, at the beginning of every decade as can he proven by living witnesses.

The regular recurreuce of this meteorological phenomenon should be enough to satisfy the most sceptical that astronomers aud other scientists are correct when they affirm that disturhances upon thc sun's photosphere, which occur ahout every tenth or eleventh year, also produce simultaneous disturhances in the electrical currents of the earth and atmosphere, therehy creating storms, tornados, earthquakes, typhoons and devastating floods.

If this he true (and the experience of sixty years, as well as philosophical theory, renders it at least plausible) we may reasouably expect the recurrence of a flood every tenth or eleveuth year and predict its advent with as much precision as we can predict the phases of the moon, or changes of the season.

In view of the absolute certainty of these periodical floodings, it is the duty of people living in the valleys and on the margin of the rivers and creeks, in this State to adopt some plan to save their farms and gardens from heing overflowed and ruined by the rivers. The chiof source of destruction to valley lands hordering the streams, is the ahrasion and wearing away of the hanks by tho swollen waters.

For somo inexplicable reason, an American farmer uever can learn the value of trees and shrubs. Ahout the first thing he doee after enclosing his farm is to chop down, grub up and burn up every natural tree, bush and shruh on the place. Now overy rational person knowe that a loose, loamy eoil, such as we have in California, when not cemented and stayed by the roots of trees and shrubs must necessarily crumhle aud wash away when attacked hy rapidly running streame.

At a venture we suggest that the banks of all the streams in the country subject to abrasion be immediately planted with yellow German willow, or common basket willow of commerce. This shrub grows rapidly from cuttings; has an enormous spread of roots and the more it is cut off the wider it continues to spread. Iu addition to its heing a strengthener of the banks against abrasion, it will, to some exteut be valuable in the manufacture of wicker ware.

We merely suggest this as a starter without stopping to consider its practicability; at any event something should he done to save the land from abrasion by devastating floods, and that too quickly.

Truckee, Nevada.

During a recent vieit to this place I went to see the Truckee Smelting Works owned by Swain & Co., of San Francisco. These large and extensive works are situated on the hanks of the Truckee River. The main building is 30x80 feet, aud the ore house 40x40 feet. There are two furnaces 30 feet high, 4 feet square, and having a capacity of 10 tons, each lined with the best fire hrick from San Francisco. The engine used is 10-horse power. An assay office is connected with the works under the management of M. L. Cross. The hullion is sold to Selhy & Co., of San Francisco. In the last run made, before my visit thcy turned out25 tons of bullion iu 10 days which averaged 148 ounces of silver to the ton. They have a large shed 40x80 feet for storing charcoal, and have on hand for winter use about 25,000 bushels, which cost them 12 cents per bushel. Ores are brought from many districts in Nevada and Utah along the railroad, for reductiou at these works. Mr. Adlington is foremau.

Truckee is one of the best places for the lumber husiness in Nevada, and a large amount of the very hest lumber is cut and eawe dhere. Mr. E. Ellen has a large sawmill from which he turus out shingles, laths and all descriptions of lumber. The Truckee Lumber Co. have extensive works hero also, getting thcir water-power from the river as does the other mill. The sawmill is 50x120 feet and the planing mill 40x120. They make doors, sashes, blinds, etc., and all kinds of building material. The capacity is 80,000 feet of lumher per day when ruuuing full. A turhine wheel of 80-horse power is in use. Tho Truckee Hotel at the railroad depot, kept by John F. Moody, is the hest in thc place and has good accommodations. The city is built up with good substantial edifices.

W. H. M.

The Paul Process at Dun Glen.

Editors Press:—In my last I spoke of the Lang Syne mine, and unwillingly made an error which demands of me another letter in order to set right. The name was all right as its former one but receutly it has been conveyed to the incorporation known as the Great Central Mining Company of San Francisco, of which G. O'Hara Taaffe is President. Sprague & Company to whom I attributed its ownership are the large owners in it however. This mine is now being developed into a mine of some importance. Tho adit tunnel is now in some 225 feet which gives 100 feet of "hacks" to work out. They have two fine strata of pay ore, and have out for hauling to mill some 100 tons of first-class ore and as much more of lower grade. The ore will he worked by the Paul process at Sprague & Company's mill of which I wrote you in my last. This mill has reduced and worked ore with such succese that it is now considered a risk of the metal to work hy the old way. Paul'e new self-feeding and self-discharging pulverizing barrel hae been set to work lately and proves to be a thorough and fast pulverizer and is as great a euccess as his Process. It moves without the least trouble or attention, doing a large amount of work and takes the ore from No. 12 wiro screens. With many other minors I have had my prejudices against "Processes" and uew things, hut I am compelled to accord to Mr. Paul the credit of having hrought forth something radically new, that has genuine merit in it. The hullion of base ores is fine. It gets more metal out of our ores thau pans possihly can, $2 to $1, and runs right along, and why should not one give in to euch stubborn facts. Mr. Paul left here for San Francisco about a week ago, having the eatisfaction of seeing his work a complete success and receiving the good wishes of all, for in connection with the enterprise of Sprague & Company our almost deserted camp is receiving renewed life and an increase of population. Work on the Tulalah is heing pushed ahead vigorously.

Humboldter.

Dun Glen, Nev., Jan. 11th, 1872.

How to Keep From Freezing.

Editors Press:—I have heard of many persone throughout the mountains getting their hands and feet frozen while traveling; of course they are away from houses, or material for the speedy kindling of a fire, and before they can get to shelter or timher, frost does its work. Now my object in communicating this to the Press, is that a slight protection against such mishaps may receive a wide circulation, in mining localities situated far back in the mouutains, where snow is the deepest, and cold intense. At South Pass, in the winter of '68, I tricd the method, here given, and found it a good one.

Take an ordinary "Dark Lantern" and fasten it at the waist, in front of the person; have the coat, cloak, or hlanket to cover it, so that if riding or walking the hands can be placed directly on it; have the vessel that contains the oil so fastened that it will not jostle ahout, even if you should jump up and down, or fall down. Use oil in hurning.

The one I used was a small affair, and had a contrivance to close over and obscure the light, and also an arrangement fixed so that a belt could he passed through it, and around the waist, thereby holding it firmly in its place. It is then convenient for the hands, and in an extreme emergency it can be taken off and the feet warmed.

For persons who have a long distance to travel, a small canteen could he filled with oil, and slung over the shoulders, a supply would then be on hand to replenish the lamp or to aid in kindling a fire, if nccessary. It ie a fact that most persons are frozen, wheu out doors, while in the act of kindling a fire; the material is either damp, covered with snow and ice or a light cannot he etruck; and it is frequently the case, that not until the last minute do they conclude to build a fire. With one of these dark lanterus—commonly called a "Bulls-eye"—and a little oil the traveler has constantly with him a fire. True, it is but a small blaze, but what a delight that hlaze can create in the feeling of loet and cold travelers!

Another advantage gained by having along this little companion on a dark night, is that the sliding door can he opened, and the light'e rays, concentrated through the thick glass in front, thrown along the pathway and the correctness of your route determined, or any obstruction laying in your way seen and ite passage or removal accomplished.

The advantage of this little lantern cannot be fully understood, or rather appreciated until one is caught far from settlements in a cold dark night.

If I may, through these few instructions, be the cause of saving any one from freezing, the mere knowledge will he a pleasure to me through life. N. L. Turner.

Ophir City, U. T., Jan., 1872.

The Cost of Epidemics.—The statistics of small-pox, as it has been raging in London, are frightful, and, all things considered, mortifying, since they show that man is such a fool that he cannot profit hy the knowledge which Providence, or his own luck, vouchsafes to him. Notwithstanding the assured safety which vaccination offers, not less than 5,000 persons have died of the diseaso in London, while at least 100,000 have been maimed, disfigured and pauperized. The money cost to the metropolis of the epidemic has not heen less than $500,000. But this disregard of ordinary precautions is, perhaps, no greater, though it may, perhaps, he hetter defiued than the reckleseness which courts the advance of cholera by neglecting a few simple sanitary precautione. One would think that, as a race, we hated life, instead of loving it too well. Our theory ie that to its preservation all other things must defer; the law allows every one to defend it, and hangs those who unlawfully take it; but for all thie we go on risking it and loeing it, as if we had ninety-nine existeuces at our disposal instead of one.—*Medical and Surgical Reporter.*

Heavy Wheat.—Culpepper county, Va., *Farmer* eaye, that from three quarts of the Touzelle wheat sown on one-tenth of an acre, he harvested five bushels, weighing 66 pounds to the bushel. It ripened June 1st, about eight days earlier thau other varieties.

MECHANICAL PROGRESS.

Machine Puddling a Success.

No improvement in modern days has been more earnestly desired by the iron trade than a successful, practical machine puddler. The attainment of such an invention can not be considered of any less value than the Bessemer process of making steel. Various devices have been tried with greater or less success, the most promising of which have been based upon the principle of employing a rotary chamber in which to perform the work. Such devices have been tried both in this country and in Europe, and have been found perfectly practical with the single exception of the difficulty attending the procurement of a durable lining for the chamber.

During the past year, success in this important particular has been claimed by a Mr. Danks, of Cincinnati, who has devised a lining which is said to fully meet all reasonable requirements. Mr. D., after putting such a furnace into successful operation in Cincinnati, went to England, of which country he is a native, and explained his process in an elaborate paper, read before the Iron and Steel Institute. His deportment was such as to secure the confidence of that association to such an extent that it appointed a committee of experts to return with him and thoroughly examine into the merits of the alleged invention. This commission left England early in October last, taking with them about 40 tons of different kinds of English pig-irons, (such as they had unsuccessfully experimented with,) to be operated on as a crucial test. This commission has telegraphed to England, as stated in our issue of last week, that they had found the invention a complete success, a result which will at once insure its general adoption in England and on the Continent.

The Dank's Furnace,

Aside from its obvious general mechanical arrangement and construction, consists of rotating upon a horizontal axle one end of a chamber which communicates with a furnace in which the flame is urged by fan-blasts, and the other with a flue; this latter being closed by a detachable head while the apparatus is in use. The rotation of the chamber, duly charged with molten pig, of course insures the requisite movement of the metal, and consequently the results commonly obtained by the action of the puddler's tool. At the proper stage of the process, the head of the chamber is taken off, the flue moved aside out of the way, and a large fork suspended from a crane is thrust in. A few turns of the chamber then causes the ball to adhere to the fork, and the latter being withdrawn conveys the ball to the squeezing machinery. The method of lining this chamber is described as follows:

"The foundation for the lining consists of a mixture of pulverized iron ore and pure lime, worked with water into the consistency of a thick paste. Upon the completion of the initial lining, a quantity of pulverized iron ore, about one-fifth of the total amount required to line the apparatus, is thrown in, the furnaces is heated and made to revolve slowly until the iron is found to be completely melted, when the apparatus is stopped. That part of the molten iron which has not been consumed by glazing the initial lining surface runs to the lowest level of the furnace, and there forms a pool, into which there are put a number of small and large lumps of iron ore of such dimensions as will be required to allow the said lumps to project over the surface of the liquid ore by from two to six inches. This part of the lining is allowed to set, when a fresh quantity of pulverized ore is thrown in. The furnace is again made to rotate slightly until the newly added ore is liquefied, when the apparatus is again stopped, and the pool filled with lumps as before. The operation is continued in this way until the whole of the vessel is properly lined. From 2 to 2½ tons of iron ore are required to line a 700 lbs. furnace.

The London *Mining Journal* in alluding to the reported success of this invention, says: "The news appears too good to be true. The problem will, however, soon have its solution. We shall then know if in the United States there is at work a rotary puddling furnace which, although not very different from that with which Mr. Menelaus has been experimenting, yet has distinguished itself with important difference of having been a success, while the British machine cannot be so regarded."

Our cotemporary has ere this found the "news" both "good" and "true," and the meeting of the Iron and Steel Association before whom Mr. Danks read his paper, already referred to, will become, as the *Journal* said it would, if the expectations thus raised were realized, "more memorable in the history of this iron trade than that meeting in Cheltenham, at which Mr. Bessemer read to the British Association his famous paper, will prove to the steel trade."

It thus appears that this American invention is destined to take its place foremost among the improvements adopted by the greatest iron-making country in the world. The real value of the principle is shown not only in the doing away of the severe manual labor in the puddling operation, but also in the production of larger balls at a single heat than could be done by the old method; in an increased economy of fuel, and a greater yield of iron from a given grade and quantity of ore. In the furnaces at Cincinnati, puddled balls ranging from 650 to 1,000 pounds are conveniently made, and no special difficulty appears to have been met with in forming into a single ball the product of a heat of 1,400 pounds.

The iron is charged into the furnace either in a solid or molten condition. When charged in the shape of pig-iron, the melting down occupies from 30 to 35 minutes, during which a partial rotation is given to the furnace from time to time in order to expose equally all sides of the charge to the flame. When the whole of this is thoroughly melted, the furnace is made to rotate only once or twice per minute during the five or ten minutes, in order to obtain the most perfect action of the cinder upon the molten iron. But this article has already become quite too long to admit of any further details of the process at this time.

PULVERIZED FUEL—A SERIOUS DRAWBACK.—An "eminent engineer," who has had some experience in the use of pulverized fuel, says that although perfectly successful at first, it grew gradually unsatisfactory from the glazing produced upon the flues, grates, etc.; the percentage of silex, etc., which in ordinary stoking and burning is carried off as slag and refuse, being carried against the throat, etc., brings on a vitreous diptheria which is fatal to the flues. It is intimated in reply that in the use of this kind of fuel, much will of course depend upon the character of the material. If the refuse is easily vitrified, then the result described may possibly occur; but, if the refuse is not easily vitrified, it will be carried out of the chimney in the form of dust. Pulverized fuel has been successfully used by several establishments for a year or more, and is no doubt the most economical way in which coal can be used, when the objection above referred to does not interpose. By reference to another column it will be seen that the principle is about to be introduced into one of the principal machine shops in this city.

IMPROVED CONSTRUCTION OF SHEET-IRON STACKS.—Sheet-iron stacks, especially for heating and puddling furnaces, are now being made in separate rings, instead of one whole length as formerly. Each ring has a band of flat bar-iron—horseshoe bar—about two inches from the lower edge, firmly riveted, and by which each is supported as it fits into and rests on the edge of the one next below. By making the stack in this way in short sections, it can be more conveniently erected, and also can be repaired by renewing any worn-out part or burnt section at less cost and much less labor than when otherwise constructed.

SPEED OF OCEAN STEAMERS.—The steamship *Oceanic*, of the new "White Star" line, during a late trip from New York to Liverpool, ran 384 knots in a single day, which is spoken of by some of the newspapers as being the greatest distance ever made in twenty-four hours. This, says the *American Artizan*, seems to be a mistake, for we find by reference to our records of the passages of steamers, that the *City of Baltimore*, of the "Inman" line, ran 385 miles in twenty-four hours, in the year 1866.

IRON SHIP-BUILDING IN THE UNITED STATES.—No iron ships were built in the United States in 1867. In 1868 six small vessels were constructed, having an aggregate of 2,800 tons; in 1869 ten were built, of an aggregate of 4,584 tons; in 1870 fifteen, with an aggregate burthen of 8,281 tons; and in 1871, up to the middle of November, twenty were constructed, measuring an aggregate of 15,479 tons. Of the twenty iron vessels built during the year ending January 31, 1871, nineteen were steamers.

SCIENTIFIC PROGRESS.

The Force of Life.

There have been writers who affirmed that the pyramids of Egypt were the productions of Nature. We now regard them as the work of men's hands, aided by machinery of which no record remains. The blocks in this case were moved by a power external to themselves, and the final form of the pyramid expressed the thought of the human builder.

Let us pass from this illustration of building power to another of a different kind. When a solution of common salt is slowly evaporated the water disappears, but the salt remains behind. At certain stages of concentration particles, or molecules, as they are called, begin to deposit themselves as minute solids, so minute, indeed, as to defy all microscopic power. As evaporation continues, solidifications goes on and we finally obtain a mass of salt of a definte form.

What is this form? It sometimes seems as a mimicry of the architecture of Egypt. We have little pyramids, terrace above terrace forming a series of steps resembling those of the pyramids. The human mind is as little disposed to look at these little salt crystals without further question as to look at the pyramids of Egypt without inquiring whence they came. How, then, are those salt pyramids built up?

Guided by analogy, we may suppose that swarming among the constituent molecules of the salt there is an invisible population, guided and coerced by some invisible master, and placing the atomic blocks in their positions. This, however, is not the scientific idea, nor do I think your good sense will accept it as a likely one. The scientific idea is that the molecules act upon each other without the intervention of slave labor; that they attract and repel each other at definite points, and in certain different directions, and that the pyramidal form is the result of this play of attraction and repulsion. While then the blocks of Egypt were laid down by a power external to themselves, these molecular blocks of salt are self posited, being fixed in their places by the forces with which they act upon each other.

I take common salt as an illustration, because it is so familiar but almost any other substance would answer equally well. In fact, throughout organic Nature, we have this structural energy ready to come into play. It is present everywhere. The ice of our winters and of our polar regions is its hand-work, and so equally are the quartz, feldspar and of mica of our rocks.

This tendency of matter to organize itself, to grow into shape, to assume definite forms in obedience to the definite action of force, is all-pervading. It is in the ground on which you tread, in the water you drink, in the air you breath. Incipient life, in fact, manifests itself throughout the whole of what we call inorganic Nature.

The forms of minerals resulting from this play of forces are various and exhibit different degress of complexity. Men of science avail themselves of all possible means of exploring this molecular architecture. For this purpose they employ as agents of exploration, light, heat, magnetism, electricity and sound. Polarized light is especially useful and powerful here. A beam of such light, when sent into the molecules of a crystal, is acted on by them and from this action we infer with more or less clearness the manner in which the molecules are arranged. The difference, for example between the inner structure of a plate of rock-salt and a plate of crystallized sugar is thus strikingly revealed.

And now let us pass from what we are accustomed to regard as a dead mineral, to a living grain of corn. When it is examined by polarized light, chromatic phenomena similar to those noticed in crystals are observed. And why? Because the architecture of the grain resembles in some degree the architecture of the crystal. In the corn the molecules are also set in definite positions, from which they act upon the light. But what has built together the molecules of the corn! I have already said, regarding crystalline architecture, that you may, if you please, consider the atoms and molecules to be placed in position by a power external to themselves. The same hypothesis is open to you now. But, if in the case of crystals you have rejected this notion of an external architect, I think you are bound to reject it now, and to conclude that the molecules of corn are self-posited by the forces by which they act upon each other. It would be poor philosophy to invoke an external agent in the one case, and reject it in the other.

But, I must go still further, and affirm that in the eye of science the animal body is just as much the product of molecular forces as the stalk and ear of corn, or as the crystal of salt or sugar. Many of its parts are obviously mechanical. Take the human heart, for example, with its exquisite system of valves, or take the eye or hand. Animal heat, moreover, is the same in kind as the heat of a fire, being produced by the same chemical process. Animal motion, too, is directly derived from the food of the animal.

As regards matter, the animal body creates nothing; as regards force, it creates nothing. Which of you by taking thought can add one cubit to his stature? All that has been said regarding the plant may be re-stated with regard to the animal. Every particle that enters into the composition of a muscle, a nerve, or a bone, has been placed in its position by a molecular force; and unless the existence of law in these matters be denied, and the element of caprice be introduced, we must conclude that, given the relation of any molecule of the body to its environment, its position in the body might be predicted. Our difficulty is not with the quality of the problem, but with its complexity; and this difficulty might be met by the simple expansion of the faculties which man now possesses. Given this expansion, and given the necessary molecular data, the chick might be deduced as rigorously and as logically from the egg as the existence of Neptune was deduced from the disturbances of Uranus, or as conical refraction was deduced from the undulatory theory of light.—*Condensed from a lecture by Tyndall.*

Iron Electrotypes.

The art of electrotyping, says a contemporary, already applied to myriad uses, shows constant evidence of progress, especially in the successful deposition for practical purposes of metals that have hitherto been considered intractable. Nickel-plating is now common, and, while cheaper, is for some purposes superior to silver; and there is some reason to suppose that by the employment of a small percentage of some other metal to diminish the brittleness, the rather refractory nature of the nickel coating may be brought more completely under the control of the burnisher, in lieu of the polishing wheel, than is now the case.

There are many purposes, however, for which a plating of iron would be, all things considered, better than any of those now familiar in electro-metallurgy; and to secure this has occupied the attention of some foreign experimenters, who have, apparently, been very successful in their efforts.

At the late London International Exhibition (1871) were exhibited bank-note plates, medallions, and a page of printing-type, electrotyped in iron, by a process devised by M. Eugene Klein, who is at the head of the Chemical Department in the Imperial State Paper Manufactory in St. Petersburg.

The advancement of the iron electrotype to a practical success has not been accomplished without the expenditure of much thought and experiment, and many difficulties have had to be surmounted; but the scientific interest which attached to the new development, and the eminently useful applications of which he saw it was susceptible, especially in the departments of engraving and printing, stimulated M. Klein to continue his experiments, against what appeared to be almost or quite insurmountable hindrances.

His starting point was the steeling of engraved copper-plates, which process was effected in a bath composed of chlorate of ammonia and iron, to which he added a small quantity of glycerine. On leaving the bath the iron is as hard as tempered steel and very brittle. Reheated it loses much of its hardness, and becomes malleable at cherry red, when it may be cut with the graver as readily as soft steel.

Of the importance of the practical application of the process there can be no doubt whatever. By replacing plates of copper by those of iron, greater facilities will be afforded for producing publications, works of art, and especially bank-notes and checks. Iron electrotype plates are found to be almost indestructible in the process of printing, while copper soon wears out—much sooner, in fact, than wood. A late issue of *Engineering* gives in detail the experiments through which this important process has advanced to a condition of high practical value.

Mining Summary.

The following information is condensed mostly from journals published in the interior, in close proximity to the mines mentioned.

California.

ALPINE COUNTY.

Monitor *Miner*, Jan. 3: Work is going on at both quartz mills as fast as possible under the circumstances.

Changed Hands..—Silver Mt. *Chronicle*, Dec. 30: Several valuable mines in Scandanavian Cañon, Silver Mt. Dist., have this week passed into the hands of English capitalists.

Schenectady (Tarshish) M. and M.—The mill is rapidly approaching completion. It would have been ready to commence work on New Years Day had it not been for the impossibility of obtaining a sufficient number of skilled mechanics. It is, however, expected it will be in running order early in Feb. The machinery consists of 20 stamps, 650 lbs each, which will work at the rate of 90 blows per minute; 6 amalgamating pans of a capacity of from 2,000 to 3,000 lbs to the charge. There are 3 settlers, 7 ft. in diameter, with clean-up pan, etc.—all driven by a 60 horse-power engine, with two fine boilers capable of generatiug steam iu considerable excesss of the present anticipated requirements of the mill. The roasting furnace in connection with the mill is on the revolving principle. The mine is lookiug well; much first-class ore is coming out of the lower tunnel, assays of which run from $100 to $1,000 per ton. It is expected this tunnel, with the 150 ft. level, will furnish sufficient ore to keep the mill running at the rate of 20 tons per day, without touching the large body of reserves in the upper works for some time.

AMADOR COUNTY.

Rich Strike.—Amador *Ledger*, Jan. 13: On Tucsday last, workmen in the third etope in the Kennedy, struck the richest rock ever yet discovered in that mine. The main ledge in tbis stope, is 9 ft. in thickness, and the whole body of rock equal to the best avcrage rock iu the country. In addition to the main ledge, on the day above stated, a strata of rock about 13 iuches thick was discovered on the foot wall of extraordinary richness—we were shown a piece of the rock from this strata, weighiug 3¾ lbs, literally filled with the precious metal, estimated at $40 in value.

Gold Brick.—We were sbown by P. Reichling's assayer, a gold brick of the value of near $8,000, the result of 16 days run of the mill, on rock taken from the Kennedy mine.

CALAVERAS COUNTY.

Thorpe Mine.—Calaveras *Citizen*, Jan. 6: Matters are progressing favorably with the Thorpe Mine, at Fourth Crossing. The battery is kept running night aud day, and about 40 tons of rock have already been crushed. The mine is flooded, but there is rock enough out to keep the battery going for 6 weeks or more. New hoisting works are being erected.

Sandy Gulch.—Calaveras *Chronicle*, Jan. 15: The mines, so far as the rich placers are concerned, arouud this camp are nearly worked out. But there have been several new quartz discoveries made of late. The latest discovery of a mineral character, was made hy C. Brown, who accidentally found a lead that will prove to he a rich and valuable mine. It is in the "Devil's Half Acre," a short distance from the Old Store. As soon as the roads are again in a passable condition, the necessary machinery for the development of the mine will be placed in position aud set to work. The main shaft is down 25 ft., and the lead from 25 to 30 inches in width, showing free gold in almost all the rock taken out. The old Woodhouse mine is being worked with renewed energy. From 25 tons of rock taken from the miue and worked at the mill of the proprietor, $1,400 was obtained. The owners expect to take out 500 tons of first-class ore this winter. The rock beiug takeu out is of excellent quality. The "Big Mine," just across the South Fork is getting along nicely. The shaft is down 200 ft. and ore of an excellent quality is being taken out of tbe levels heing run. The ledge is wide and well defined.

Gwin Mine.—Operations at the Gwin mine will he resumed next Monday.

Sluice Robberies.—The sluice hoxes of Domingo & Co. and Mike McGrath, engaged in mining operatious at Buckeye, were robbed on Saturday last. Domingo & Co. lost from 10 to 12 ozs. of dust. We have not learned how much McGrath lost.

NEVADA COUNTY.

Little Deer Creek.—Nevada *Transcript*, Jan. 14: The Murchie Bros. have started work in their hydraulic claims between Little Decr creek and the Red Dog road. They are running 2 hydraulic monitors, and employ 12 men.

The Murchie quartz mine near Little Deer creek, is also heing worked. They have about 40 tons of rich rock at the mill, but the roads are so had that they are prevented from hauling. The mine continues rich.

Pittsburg Mine.—The Pittshurg mine, has not been impeded in work in the least hy water, during the late storms. The mill is kept in constant operation and the rock which is heing taken out is first rate.

Banner Mine.—The mine is looking well and men are at work in the 400 ft. level.

Perrin Mine.—The Perrin mine on Wolf creek, below grass Valley is looking splendidly. They are taking out rock at the rate of 24 tons per day when the mill is kept at work. The rock is rich and tbe expense in working is light.

Location.—Fayette Battis & Co. have located 6 claims for mining purposes on the North Fork of the Diamond creek, below the F. Meister claims, in Washington township.

North San Juan.—Cor. same: The mines at this place, Manzanita Hill, Birchville, French Corral, Empire Flat, Kennebec Hill and Moore's Flat are all in successful operation, and reports say, all of the Co's. are doing well.

The American claims at Manzanita hill, withiu a mile of this place, are, and have been for months past, paying immmensely

At Columbia Hill, recently a company has been organized, to construct a tunnel from a point near the South Yuha river, about half a mile above Cooper's hridge, and extending from thence to the mining ground of the Co. about 2,000 ft. distant from the starting point.—When completed, this tunnel will drain all the mines at and uear Columbia Hill, Kennebec Hill and in those neighborhoods, for it is the intention of the Co. to commence the tunnel low enough to work that entire country.

Hydraulic.—Grass Valley *Republican*, Jan. 14: The Baltic Gravel M. Co., near Randolph Flat, are actively at work hydraulicing. They employ 7 men, and have an abundauce of water.

Quartz.—The owners of the Wyomiug ledge on Wood's ravine, 2 milee from Nevada, have 250 tons of quartz out ready for crushing. The rock it is said will average $25 a ton.

PLACER COUNTY.

Ophir.—Cor. Placer *Herald*, Jan. 13th: On the Greene mine, Green & Co , bave erected a douhle engine, one for hoisting the dirt and ore from the shaft, and the other for pumping purposes. Some time ago the Co. let a contract to parties to sink the shaft 100 ft. deeper. The contractors are getting along very well, and will complete their contract by early spring. The ledge in the shaft is of good size, looks well and will pay rich.

We will follow along the Green ledge and the next mine in operation is the original Peter Walter mine. This Co. bas erected steam hoisting workson their mine and have a 25 horse-power engine. The levels that are heing run are at the depth of 116 ft. from the surface, and they find no variation in the quality or quantity of the rock, it contiuuing to look well, the quartz sbowing free gold and plenty of rich sulphurets. The ledge is a good size, and in a short time the mine will be opened thoroughly. The Co. contemplate erecting a 10-stamp mill as soon as the weather will permit.

North of the Peter Walter some 300 yards is the Bellevue, origiually the Buckeye. This Co. have at their dump pile near 500 tons of ore that is No. 1. I have no doubt but what they will realize from this rock $15,000 in free gold, and prohably $5,000 more in sulphurets. They intend to crush this oar at the St Patrick mill, and will hegin ahout the 20th of tbis month. The Bellevue Co. are still raising rock to the surface.

The St Patrick mill contains 15 stamps, and with all the improvements, sufficient to save the gold and adequate pans to work the blanket washings and sulphurets. This mill is run by steam, and in connection with it the Co. havc a ledge called the Perchy that they are prospecting with a tunnel and shaft. The tunnel will cut the ledge about 130 ft. from the surface. The shaft is down to the depth of 75 ft., and they are running a level at this depth and finding a good sized ledge and good ore. The St Patrick mine is still in operation; they are running a bottom level with a good prospect. They are crushing ore from this mine at their mill, and judging from appearances, it is paying very rich. They have a large pile of ore at this mine which they will finish crushiug as soon as they get through with the Bellevue rock.

Nevada.

EUREKA DISTRICT.

Bullion.—Eureka *Sentinel*, Jan. 7: Our furnaces are doing excellent work, and turning out an immense amount of hullion daily. The Richmond, Eureka Cons., and Phenix have each made extraordinary fine runs for the past week.

Nearly Completed.—The new furnaces of the Richmond Co. are nearly completed and will in a few days he ready for active service.

Eureka Cons.—Four thousand tons of ore are now on the dumps and at the furnaces.

The Richmond.—As explorations are exteuded and depth attained, the same mammoth, unbroken mass of ore is everywhere met with. Within the last two weeks a winze 30 odd ft. deeper than the old or lower workings has been sunk, which demonstrates the continuity of rich smelting ore in unlimited quantities to that depth, and the end is not yet. Drifts have also hcen run at right angles with the general course of the vein, estahlishing the average width of the deposit at this point to he not less than 134 ft.

ELY DISTRICT.

Bullion Shipment for Dec.—Pioche *Record*, Jan. 4: During Dec. 203 bars of bullion, valued at $333,659.76 were shipped from this Dist. W. F. & Co. shipped since Dec. 31st., hullion valued at $18,680 07.

Red Cloud Ledge is on the mountain side about 700 ft. above the Washington & Creole mine. Tbe shaft is down 15 ft. deep. Last week a contract was let to sink 60 ft. deeper. After the work was commenced and the old shaft cleared, the contracters sunk about 8 ft., when a 4 ft. ledge was struck. The walls are hard and smooth, of quartzite, and pitch nearly perpendicular. An assay made from an average sample of ore, or what was supposed to be an average sample, gave $840.56 in silver and $50.23 in gold, making a total of $890 79 per ton. Work will be prosecuted from this time forward until the the miue is fully developed.

REESE RIVER.

Bullion from the El Dorado South.—Reese River *Reveille*, Jan. 6th: W. F. Leon Supt. of the El Dorado South Mine of Belmont, started the Stetefeldt mill on the 25th of last Oct., since which time up to Dec. 31st, he had shipped 107 hars of hullion, valued at $52,181.45. During a run of 25 days iu Dcc. his shipment amounted to 43 bars, of the value of $22,509.39. The Pacific Co. have shipped 16 bars of hullion valued at $14,513.39. Paxton & Co. shipped during 1871, 492 hars of bullion of the value of $309,910.50 and during Dec. 68 hars of hullion valued at $40,224.80. Twelve bars of bullion, valued at $6,050.47, were shipped from the Montezuma mill during Dec.

Oregon Mine. —Recent workings of ore from the Oregon Mine, gave the following yield of silver per ton; lot one, 5 tons, $680.19; lot two, 9 tons, $433.34; lot three, 7¼ tons $313.38.

Diana Mine.—Three tons of ore from the Diana Mine worked last week, returned $696.63 per ton.

Ophir Canon.—This once lively camp is very quiet, though some work is still being done.

WASHOE.

Sutro Tunnel.—Virginia *Enterprise*, Jan. 7: The Tunnel was yesterday in 2,670 ft.; ground hard. Sbaft No. 1 is down 55 ft.; ground good. No. 2 is down 58 ft., and is also in ground that works well. No. 3 is down 40 ft.; ground hard. No. 4 is down 45 ft.; ground is also bard.

The Savage last week yielded ore to the value of $14,035.74.

At Dayton, Janin's mill—running on tailings—has again started up.

The Yellow Jacket mill, Carson river, started up 20 stamps last Saturday. Other mills are still eugaged in repairing damages to flumes, dams, etc.

Eureka Mill.—Work upon the new Eureka mill, Carson river, is heing vigorously prosecnted. The frame is up and the huilding nearly inclosed. The battery timhers are framed and in place, and all the other timher-work is fast advancing toward completion.

Rye Patch.—Reno *State Journal*, Jan. 6: The Butte M. & M. Co. of that place have resumed operations, and the Alpha Co. have struck a rich hody of ore. The Butte Co. have heen offered $120,000 for their mill and mine.

The Mills.—Carson *Register* Jan. 10: The Morgan mill near Empire City, is now running 30 stamps on high grade ore from the Crown Point mine. Both the Brunswick and Mexican mills (56 and 40 stamps respectively), belonging to the same company, will be ready to start up early next week, the damages hy the late floods having heen repaired.

WHITE PINE.

Eberhardt & Aurora Co's Works.—White Pine *News:* A few days ago we visited the mines and works. In the Ward Beecher we first descended to the bottom of the open cut, a distance of 45 ft., where the ledge pitches east at an angle of 32°. Connecting with it is the Phillpots chamher, through which the ledge can be easily traced for a distance of 85 ft. In the east end of the chamher a large body of fair milling ore is in sight. We found a force of men at work making an opening preparatory to hreasting out. In the hottom of the chamber there are ahout 300 tons of ore hroken down. Retracing our steps from the chamber to the open cut, we entered another large chamher, running north and opened out for a distance of 240 ft., which brought us to the line of ground in dispute betwecn the English Co. and the Beecher Co. It is estimated that there are 5,000 tons of ore in sight above the floor of the chamher. The depth of the ore in the hottom has not heen determined. There is a fine showing of it in sight, and as in other parts of the mine, it dips to the east. From the south side of the opeu cut, a drift is pushed ahead south to connect with the Lady's chamber, and connection will he made with tbat portion of the mine in a few days. Visited the east and west drifts, running to tap the ore in the Phillpott's chamher, and found fair ore in sight. The next place examined was the raise (and drift) to tap the open cut in the south end of the Ward Beecher at the mouth of the Phillpott's chamber. Then, into a drift running south from the top of the Lady's chamber, for the purpose of opening out into the south drift. The south drift is in a distance of 130 ft. from the chamher. For most of the distance it cuts through a mass of low-grade ore. The recent strike was made at the end of the drift, and shows rich ore. The orc in the bottom looks fully as well as any other part of the chamher. Also, a fine showing in the east and south facings. The distance from Risdale chamber to the south line of the ground owned hy the Eberhardt & Aurora Co. is 220 ft., and the lengtb of the ground from the north to south line is about 1,400 ft. There are over 500 ft. north of the Risdale chamber untouched, and it is reasonable to suppose that the same streak of ore found in North Aurora runs through to the Risdale.

Great Valley M. Co. — The mines owned by the Great Valley M. Co. are at the foot of Babylon Hill, near Shermantown, and consist of Great Valley and Union mines, with a length of 2,000 ft. of ground. The location of the ground was made in April, 1868. A tunnel was started, and run west a distance of 200 ft. in ore. Fifty ft. from tbe end of the tunnel a shaft was put down and ore found. An air sbaft was sunk 125 ft. deep and they found a fine body of ore the whole distance down. Afterward a shaft 30 ft. deep was sunk on the side, and a ledge of mineral 5 ft. wide developed—making altogether a depth of 155 ft. in ore, from the top of the air shaft to the bottom of the 30-ft. shaft. Three other shafts are down on the line of tbe ledge, and ore found in all of them. The ledge is prospected for a distance of 1,000 ft., showing ore wherever the ledge is opencd. Five hundred tons of ore were extracted from the mine; 100 tons were disposed of at the Matteson Furnace, and 400 to the other furnaces in the Dist. It is estimated tbat 75 tons of ore can be extractcd daily from the present openings, and the nnmber of tons increased after further openings are made.

Original Hidden Treasure.—Work was suspended for a few days. Teams will he put on to ease the dumps during the coming week, if the condition of the roads will permit; and as soon as the dumps are cleared of rock the usual force of men will go on in the mine.

Silver Wave.—The Perkius shaft is down 60 ft. A new contract was let on the 25th of last month to sink 75 ft. deeper. The Lyford shaft is down 60 ft., and the incline is down to a depth of 25 ft. Now running east from the hottom. The formation in sight in the Chenoweth is black spar. Runuing cross-drift. Drift also running east from No. 4 shaft, with good indications ahead.

East Sheboygan. — Connections have all heen made, and the manager will soon have the Exchange shaft and original tunnel, also the Exchange incline and Regent

shaft connected. The manager claims that there is sufficient ore in sight to supply a 10-stamp mill for 3 years.

SECOND SOUTH EX. OF HIDDEN TREASURE. The drift running north from the foot of the Anchor incline is carried along npon the stratified spar wall, which dips easterly under the Edgar shaft, and carries the great ore gouge. At the depth of 60 ft. in the North shaft, on Nevada street, a drift has been started running in an easterly direction. Working 10 men and prosecuting work day and night.

SOUTH AURORA.—Work is pushed on in the tunnel without intermission. All the works show favorable indications of finding ore when the point aimed at is reached.

EDOAR.—There are 150 tons of ore on the dumps, which will be shipped to mill when the roads are in good condition. A force of 10 men are at work in the breast. The body in sight is about 50 ft. wide and increasing in width.

ICEBERG.—The heavy fall of snow on Treasure Hill set back work. The breasts show well as far as the mine is opened.

Colorado.

SHIPPED.—Colorado *Miner*, Jan. 4: The Stewart S. Reducing Co. shipped for 2 weeks ending to-day, 9 bricks valued at 6042.08, also 4 lead bars valued at $2502.44. Palmer & Nichol's shipments for the week amount to 2 bars valued at $2247.21.

Campbell & Clark shipped during Dec. 15 tons of rich smelting ore for and on account of owners. The ore was taken principally from the ground of the Clark S. M. Co., on the Terrible lode.

Baily & Nott shipped during Dec. for and on account of owners, 81,509 lbs. of rich smelting ore to Swansea, Wales.

There are 15 teams hauling ore to the Colorado & Boston Smelting Works, Black Hawk. The value of the monthly shipments of ore from Clear Creek Co. to the above works amounts to about $50.000.

PELICAN LODE.—We acknowledge that DO language, at onr command, can do justice to tho rich ore deposits of this great true fissure vein. The mine is being well opened by cross cuts, adits and winzes. Hardly any stoping has been done. The amount of ore in sight, in the mino, we will not undertake to estimate. Large deposits of valuahle ore are met with throughout the whole mine.

The discovery of the Pelican is on Sherman Mt., on the east hank of Cherokee Gulch. There are 4 adits in the vein aggregating in length 420 ft. The depth obtained from the surface in the gulch is 85 ft. The greatest depth obtained from the surfaco in the lower west adit is about 200 ft. This adit is cut in the gulch by a tunnel about 100 ft. in length. A tunuel, 100 ft. in, is now bcing driven 300 ft. in length, to cut the vein 110 ft. from the surface. A winze is heing sunk on the vein from the lower adit to intersect the line of the long tunnel where it will cut the vein. By the first of June the mine will be in condition to yield 20 tons of rich milling ore a day. The lower, middle and second adits are connected by air shafts or winzes. The mine is well timbercd.

The Pelican is a large true fissure vein. The walls are defiued with almost mathematical exactness. The north wall is porphyry and the sonth wall granite. The breadth of the vein hetween walls averages from 5 to 8 ft. The vein matters consists of argentiferous galena, copper and iron pyrites, gray copper, black sulphurets of silver, blende, and native silver. Among many assays we select the following: No. 1 2823 ozs. silver; No. 2, 1700 ozs. silver; No. 3, fine galena, 1782 ozs. silver; No. 4, blende, 428 ozs. silver; No. 5, gangue, 808 ozs. silver.

THE Eclipse tunnel has been driven into Griffith Mountain 490 ft. One large lode has been cut in this tunnel, and drifting will commence on it in a short time.

THE Matilda Fletcher lode, Democrat Mountain, is in a royal body of ore. Thero is in this mine, from 1 to 3 inches of ore, that yields from 4,000 to 5,000 ozs. in silver per ton.

TROJAN.—Central *Herald*, Jan. 3: The Trojan lode, Grand Island Dis., continues its steady yield of rich gold ore. The entiro width of tho 3 ft. crevice is composed of 7 oz. ore, with the exception of from 4 to 10 inches of smelting ore, worth from $100 to $150 per ton.

P. P. Peck has purchased 300 ft. on the Buckeye lode, Cariboo hill, Grand Island Dist., for $230, The crevice is 3 ft. wide and is largely composed of $100 ore.

SOME gulch mining is being done below Idaho at Grass Valley bar. Fair pay is beiug obtained by sevoral parties. Further down a party of Frenchmen are making money.

IN Clifton lode, 2 shafts are being sunk and a tunnel driven into the mountains. In one of the shafts the crevice had been taken out (as far as worked,) 5ft. wide, of fine looking ore, when a shot was put into the hanging wall at one side, which blew out a block of quartz 18 inches wide and ore still in sight. An English mining captain and 34 men are employed altogether in and about the lode. Quartz from this lode has yielded as high as 500 and $600 in silver per ton.

Central City *Register*, Dec. 27: The shaft on the Garrison claim on the Kansas lode, at the depth of 265 ft., has opened out into a very fiue crevice of oro 10 iuches in width. In the underhand stope, the width of the crevice is improving, and the ore in quality. Eastward, the next claim but one, D. L. Southworth is working. The prospect is more encouraging than at any time since the discovery of this property. In the shaft 105 ft. dcep, a small crevice of copper and iron pyrites is coming in that is very promising, and the indications are that it will soon open out into a large crevice of ore.

SAINT VRAIN.—Greeley *Tribune*, Jan 3: The St. Vrain mine opens so well that the supply seems inexhaustible.

ROBERTS, Murray & Co., are sinking a shaft for coal 5 miles northeast of towu, and they are now down 95 ft. The indications are said to be uncommonly good.

Idaho.

SHIPPED.—Silver City *Aralanche*, Jan. 6: W., F. & Co. shipped from this place during the year ending Dec. 31, 1871, gold dust valued at $45,128.38, and bulliou valued at $936,234.37. This amount exceeds tho treasure shipments for 1870 by $175,-288.26.

LOCAL RECORD.—The South Oro Fino Discovery is owned and worked by the Ida Elmore Co. It appears that Sup. Minear was authorized to purchase a mine for his Co., if he could find one to suit. So, after due consideration, he bonght this mine, for whieh he paid $22,500, and is now taking out about 25 tons of ore per day. Besides this, Sup. Minear has opened up a rich vein in the 7th level of the Elmore, and has let a contract in the 6th level to run the drift far enough north so as to be able to sink a winze from the 6th to the 7th level through the rich body of ore recently struck.

Ore of a splondid quality is being taken from the Golden Chariot, between the 7th and 8th levels south of the shaft. Sup. Davies informs us that he will have 500 tons ready for the Owyhee mill by the 15th inst.

The Miunesota shaft is down 230 ft., well and substantially timhered, and drifts are being run both north and south on a fine looking vein of ore. The ore taken from the shaft and drifts is boing worked at the Elmore mill. Some of the amalgam was assayed yesterday, showing nearly $5 per ounce, from which it is estimated that the ore is milling over $60 per ton. The Cosmos mill will soon start up and be kept running steadily on Minnesota ore.

The Mahogany ledge was cut yesterday at the 4th level, where a rich vein 2 ft. wide was struck, and, judging from the appearauce of the ore, it will mill from $60 to $75 per ton.

We learn that the South Chariot, adjoining the Mahogany, has a fine 2-ft. ledge in the 4th level, of ore that will mill from $35 to $40 per ton, and easily worked. The Sup. thiuks that the ore can he mined and worked in their own mill at from $18 to $20 a ton.

Work continues to be vigorously prosecuted in the Red Jacket tunnel, which is in about 150 ft. Mr. Wells had some of this ore assayed this week which went $812.59 per ton in gold and silver.

Mr. Fassett, Sup. of the Elmira (N. Y.) Co., is still drifting north on the Empire, and taking out some fine looking ore.

Minear & Hanks are in the Empire, taking out the richest kind of silver ore.

LOON CREEK.—There are only 31 white men and 35 Chinamen wintering at Loon creek, and all hands are at work.

FLINT.—Gilmore & Winchester went to Flint Dist. this week and brought back with them between 500 and 600 lbs of bullion for Warnkee & Co. Hanson & Co., of Twilight gulch, are having 30 tons of ore worked in Black's mill.

Montana.

BANNOCK.—Cor. Bozeman *Avant Courier*, Jan. 4th: The Blue Wing Dist. is yielding large bodies of very fine ore. A. Bessette is working 10 men on the Brick Pomeroy, which shows, as far as dovcloped from 5 to 10 ft. wide of quartz, worth 35 per ton on tho dump. Mr. B is working from 5 shafts.

The Saint Paul, also in this Dist., is one of the best developed lodes in the vicinity, and is owned by Merry & Brown, who have 5 shafts down and are working the lode at a depth of 110 ft., at which depth it retains its original width and richness of ore. This vein is about 5 ft. wide and the rock will yield about $30 per ton. The Dacota Swing, Kent and Wadhams lodes are all working with good bodies of paying ore in sight.

HOT SPRINGS DIST.—Cor. same: Prospecting and the development of mines in this locality progresses slowly but surely.

Loun & Mallory have leased Mr. Hydo's Mill at Sterling, and are crushing ore from the Red Bluff Lode. They are employing a new force of miners for that lode.

Baldwin & Dorr continue sinking the shaft on the Appalachian Lode. This mine improves. and the vein widens as work progresses. Mr. Bradley's Bradly Lode looks as well as ever. Hapgood & Goodwin have let a contract for sinking on the Bullion Lode. The contractors are now at work. Very rich oro has been taken from this mine.

SILVEN MINING.—Helena *Gazette*, Jan. 1st: Work is going on quite actively ou the silver lodes in different directious from Helena. We hear of several lodes being worked on upper Ten Mile, while the miners at Jefferson and elsewhere are generally as busy as the weather will permit, and there will he many tons of ore on the dump in May next. The Reduction Works will start up again on the 10th of Jan., by which time they expoct to have on haud something over 200 tons of ore.

GRIZZLY GULCH.—At this placo the diamond City mill has been leasod by Courtright & Harvey. The mill has 20 stamps and 2 arastras. The mine is 4 ft. in width, a tunnel has been run 113 ft., 20 miners are employed breaking the rock, which gives from $20 to $25 per ton in gold.

Utah.

FORWARDED.—S. L. *Tribune*, Jan. 10th: W. F. & Co. forwarded yesterday to New York 9 bars of bullion worth $11,108.43 from the Meadow Valley works.

THE SPARROW-HAWK, CAMP FLOYD.—Capt. E. H. Shaw is pushing this mine through with a purpose. He has 43 meu on the ground, and yesterday a 20 stamp mill for the working of the ore was shipped from S. F.

LION HILL.—To-day we were shown a specimen of ore from the Sunnyside mine, Lion Hill, Ophir Dist., it is a very interesting specimen to all interested in mines on Lion Hill; as it proves that the chlorides whicb are found at or near the surface, change into sulphurets with depth. In this case the change occurred at 100 ft. The Sunnyside mine is owned by W. Hussey, and its shaft is now the deepest on Lieu Hill.

S. F. Stock Exchange Board.

Mining stocks have been active and firm for the week past and the Board has held protracted sessions owing to pressure of business.

On January account $32,400 have been received from the Meadow Valley mine. The sum of $50,726 has been received from the Raymond & Ely mine—the bullion product up to the 13th inst. A motion to change the hour of session is under consideration by the Board. Owing to press of business it is the general wish to meet at 10½ instead of 11 A.M. The new Board spoken of in another column consists of 40 charter members. There are over 80 members belonging to the San Francisco Stock Board. Stocks to-day are still steady and advancing in prices.

There are 60,000,000 acres of wheat lands in California, of which only 2,600,000 are under cultivation.

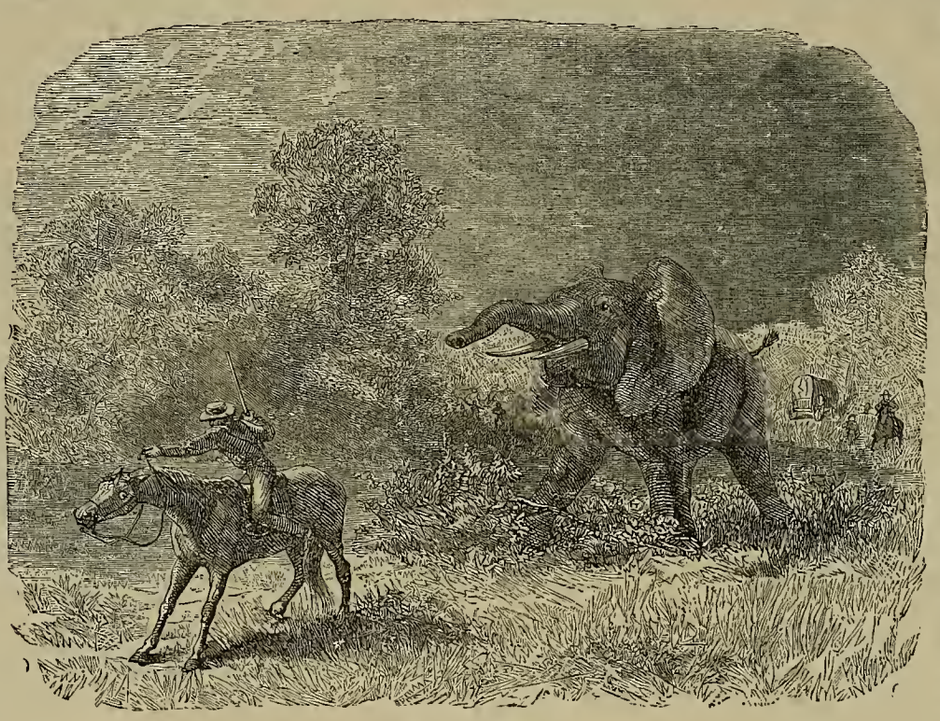
Elephant Hunting.

In this country when we wish to hunt for large game, the buffalo is supposed to fill the requirement; but in this respect African hunters have the advantage of us hy heing ahle to make an expedition against that giant of the forest, the elephant. Many of our readers have no douht seen this huge heast in a menagerie or a circus, where they are tame and docile and trained to perform various tricks; but all this is quite a different thing from meeting one in his native wilds, especially if in the situation of the man shown in our illustration; who, in addition to the danger from the proximity of the evidently enraged animal, has a haulky or frightened horse, which just at a critical moment, refuses to stir.

The elephant, even in a wild state, is one of the most wary of animals; in strength the mammoth of modern days, and most averse to human intrusion in habit. It is a reflecting, contemplative animal with strongly developed tastes for solitude and peace. Wheu they are wounded or coruered, however, they charge their assailants with great fury, and the approach aud attack requires considerable courage and presence of mind. When the hunters find an elephant they approach very carefully, and observe certain precautionary rules which only experience in the habits of the animal would cause to be followed. For instance, Du Chaillu informs us that the natives say you must never approach an elephant but from behind, as he cauuot turn very fast, and you have time to escape after firing. Great care must also be taken that the vines which are so fatal to the elephant do not also catch the huuters. When they charge, the person who wears hright clothing will be likely to get more than his share of the fuu, unless in a place of safety.

The natives of Africa hunt them in several ways. The forests iu some places are full of strong climhing plants, running to the tops of the trees, aud the natives twist and weave them together ingeniously in such a manner as to make a huge fence or obstruction not sufficient to hold the elephant, hut quite strong enough to check him in his flight and entangle him in the meshes till the hunters can have time to kill him. Once caught they surround him and put an end to his existence by discharges of spears, etc. The first motion of the animal on seeing an enemy is flight. He rushes ahead hlindly, but is brought up by the harriers of vines, which enrages and terrifies him, and he tears up everything within reach, but iu vain; for the tough vines, uowhere fastened, give way to his hlows, and the more he labors the more closely he is held.

Ano'her plan is to construct a *nghal* or inclosure, surrounded by a low fence, which, however, is sufficient to keep the elephants within, for even when enraged by a wound they hesitate to charge an assailant across an iutervening ridge, hut will hurry along to seek an opening. They are entrapped or driven into this enclosure and then caught. It seems strange that so intelligent an animal, will, with the utmost calmness, walk into this trap and remain confined within a fence not strong enongh to resist a calf; but it is nevertheless true.



ELEPHANT HUNTING.

White Gutta-Percha.—The *Journal of Applied Chemistry* gives the following method of preparing this, for dentist's use and for other purposes. Four ounces of pure gutta-percha are digested with five pounds of methyl-chloroform until the solution is thin enough to pass through filtering paper. It is then filtered (an additional pound of chloroform will facilitate this), and should then be clear and nearly oolorless. Alcohol is now added in sufficient quanity to precipitate the gutta-percha in a voluminous white mass, which is washed with alcohol, pressed in a cloth, and dried in tho air. It must finally he hoiled in water in a porcelain vessel for half an hour, and while still hot rolled into sticks. The chloroform can he separated from the alcohol hy adding water and the alcohol recovered by distillation.

Our Wool Product.

An important export of California is its annual wool clip, and whatever interests the buyers of our wools, is of equal interest to the producers.

McLennan, Whelan & Grisar's *Wool Circular* contains some very interesting matter to all connected with the wool trade on this coast. We learn from it that the receipts of California fleece for the year 1871 were 74,037 bales, or 22,187,188 lbs, and the total receipts from all quarters wore 79,791 hales, or 22,473,649 lbs. The wool was generally of short staple, and in many instances tender. With the exception of the Southern clip, which contained much less burr than in former years, it did not come up to the standard of 1870, though some extra choice lots were received. The *Circular* says that owing to a combination of causes the spring clip of this year was hought immediately on its arrival, and passed directly into the hands of consumers, represented in this market either by owners or ageuts of Eastern manufactories.

The Prices

Obtained were very high, the market having heen considerahly excited at the immediate opening of the season—an excitement which continued without intermission until its close, prices having steadily advanced from day to day.

The following facts will undeniably account for the great demand and rapid advance in the price of wools:

First—The great scarcity of medium wools in the Eastern market, as well in the hands of dealers as manufacturers; consequently, California heing the first source of supply open to fill the requirement, the buyers were eager to avail themsellves of it.

Second—The wool markets all over the world have considerahly advanced the prices for that article, as a necessary consequence the price of manufactured woolen goods has likewise increased.

The total value of the receipts of 1871 is set down at $6,605,132. The average price of spring wool is set down at 29c. per lb; fall wool at 25c.; Oregon wool at 40c. aud Foreign wool at 45c. The latter amounted to only $164,475 of the total amount of value.

The Receipts from Oregon, Etc.,

Are set down at 921,000 pounds and from foreign ports 365,461. The condition of Orogon shipments are reported not as good as in former years; some lots heing of tender staple and poor texture. Formerly, says the *Circular*, Oregon wool was characterized by freedom from hurrs, seed and tags; it was lustrous and well adapted for combing purposes. Since then the nature of this wool has completely changed, and with the exception of a few privileged counties, where the breeding has been better attended to, it does not any longer yield any combing or delaines.

Comparison with Former Years.

The receipts of California wool for the four years last past has been as follows:—for 1868,—12,987,527 pounds; for 1869,—13,677,720 pounds; for 1870,—19,472,660 pounds; for 1871,—22,187,188 pounds. Receipts from Oregon for the same period have been:—421,460; 1,039,460; 1,403,970; 921,000.

Frauds.

The *Circular* complains of frauds committed by shippers, such as corral dirt hidden in the middle of the fleeces, sand thrown in between layers of wool and wet fleeces packed among dry ones.

A Suggestion.

The *Circular* appeals to the good sense of our farmers to add a few head of sheep to their general farming stock, as is done iu Canada. These sheep will be a benefit to their farm in eating the grass which other stock do not consume, and giving the hest manure in return. These small herds can he better cared for than large oues, they are more easily kept clean, and their wool will always command a higher price than others. Long-wooled sheep especially prosper well in small bands.

Rain by Machinery.—The latest agricultural experiment in England is surface irrigation hy artificial rains. This has been tried at Stoke Park, the surface experimented upon hoing a tract of twenty acres in grass. Every night, except when natural rains made it nnnecessary, during the season of 1871, water has been applied in artificial showers. The apparatus consists of pipes laid in the ground, supplied from elevated reservoirs, into which the water is pumped by machinery. The following figures will show the result per acre: Interest (5 per cent) on cost of machinery and pipes, $7.50; superstructiou and fuel, $7.50; manure, other top dressiug, $67.50; cost of harvesting, $12.50; to'al expense, $95. The value of the product of each is stated as $200; the net profit is thus $105; Land of the same character and in the same tract, not so irrigated, netted only $45 per acre.

Volcanic Eruptions.—In the eruptiou of Vesuvius, A. D., 79, the scoria and ashes vomited forth, far exceeded the entire bulk of the mountain; while in 1660, Ætna disgorged more than 20 times its own mass. Vesuvius has sent its ashes as far as Constantinople, Syria and Egypt. It hurled stones, eight pounds in weight, to Pompeii, a distance of six miles, while similar masses were tossed up 2,000 feet above its summit. Cotopaxi has projected a hlock, 109 cubic yards in volume, a distance of niue miles; and Sumhawa, 1815, during the most terrihle eruption on record, sent its ashes as far as Java, a distance of 300 miles of surface; and out of a population of 12,000 souls, only twenty escaped.

Amendment of the Mining Law.

The following is a copy in full of the bill now before the Legislature authorizing summary removal of Trustees of mining companies, at a called meeting of shareholders:

An Act supplemental to an Act entitled an Act concerniug Corporations, passed 22d April, 1850.

The People of the State of Californa represeuted in Senate and Assembly do enact as follows:

Section 1. On petition of one-third of the shareholders formed for the purpose of mining to the County Judge of the county where said corporation has its priucipal place of husiness, verified by the signers to the effect thoy are severally the holders on the hooks of the company of the number of shares set opposite their signatures to the foregoing petition, the County Judge shall issue his notice to the shareholders of said compauy that a meeting of the shareholders will he held, stating the time, not less than five nor more than ten days after the first puhlicatiou of such notice, and the place of meeting within said county, and the object to be to take into consideration the removal of officers of said company, which notice, signed by the said County Judge, shall be puhlished daily in one or more daily newspapers published in said county for at least five days hefore the time for the meeting.

Section 2. At the time and place appointed hy said notice, thoso claiming to he shareholders who shall assemhle shall proceed to organize by the appointment of a Chairman and Secretary, and thereupon those claiming to he sharcholders shall present proof thereof, and only those showiug a right to vote shall take part in the further proceedings. If it appears that at the time appointed, or within one hour thereafter, sharcholders of less than one-half the shares aro present, no further proceedings shall he had, hut the meeting shall he *ipse facto* dissolved; but if the holders of more than one-half of the shares are present they shall proceed to vote, the Secretary calling the roll, and the members voting yea or no as tho case may be. The Secretary shall enter the same upon his book, and when he has added up the list and stated the result, he shall sign the same and hand it to the Chairman, who shall also sign the same and declare the result.

Section 3. If the result of the vote is, that the holders of a majority of all the shares of the company are in favor of the removal of one or more of the officers of the company, the meeting shall then proceed to ballot for officers to supply the vacancies thus created. Tellers shall he appointed hy the Chairman, who shall collect the ballots and deliver them to the Secretary, who shall court the same in open session, and having stated the result of the count in writing, shall sign the same and hand it to the Chairman, who shall announce the result to the meeting.

Section 4. A report of the proceedings of the meeting shall he made in writing, signed hy the Chairman and Secretary and verified hy them, and delivered to the County Judge, who shall thereupon issue to each person chosen a certificate of his election, and the petition and report, indorsed, with the date and fact of the issuance of such certificate, shall be delivered to the County Clerk, to he hy him filed in his office, and thereafter the persons thus elected officers shall be the duly elected officers, and hold office until the next regular annual meeting, unless removed under the provision hereof.

Section 5. For all services in these proceedings, the County Clerk shall receive $10 on the issuance of the notice, and $10 on the issuance of the certificate.

Section 6. All acts or parts of acts conflicting with this act are hereby repealed.

Section 7. This act shall take effect immediately.

Tea Culture.—Col. Hollister, of Los Angeles county is making extensive preparations for the culture of tea.

Popular Lectures.

Industrial and Agricultural Needs of the State.

[By Prof. Ezra S. Carr, of the Cal. State University, before the Mechanic Arts College, Mechanics' Institute Hall, S. F. Reported expressly for the Press.]

Lecture No. IV, Jan. 13, 1872.—The course of lectures before the Mechanics' Arts College was resumed on Saturday evening before a full class. Mr. Hallidie announced that the next lecture of the course would be delived by Professor Kellogg of the Chair of English Literature in the University. Prof. Carr announced as his subject the "Industrial and Agricultural needs of the State." He began by contrasting the present condition of the English laborers with those in America; and thought that the greatest proof of the power of free institutions lay in the amount of information possessed by American laborere in the face of the carclessness shown in their education, and if Europe was daily more and more preparing for a republican form of government, how careful should our Government be to secure the perpetuation of its freedom by a thorough education of its working classes.

The first great requirement in this land is the fullest and most liberal education of of the massee. It is not sufficient, in order to train a boy to vote intelligently upon the question of free trade, that he should simply understand arithmetic and grammar but that he should be liborally educated. The time is approaching when ecientific study of human nature will be a nocessity. Until the laws of life and the manner in which they affect social problems are learned and understood, legislation will remain a series of legalized experiments. A vital question is how shall we educate our young men so as to make more farmers, mechanics and producers. The lecturer gave a very graphic account of the causes which have led to the decline to the country and farm life in its social aspect, and said that one man, by leaving a rural home for the pleasnres of city life on the acquirement of riches, would unsettle the minde of many of his neighbors and render them diseatisfied with their lot. People must rely upon co-operation and community and begin to care more for neighbore than for acres. The people of the little settlement of Anaheim have profited by understanding this principle.

While drawing a vivid picturo of rural life and labor, he said that it was useleee to eulogize callings from which farmers' and mechanics' eons were turning in diegust. When they grew up they began to soe that the trades of their fathers kept them in a lower poeition in the social ecale than they wished to be, and they desired to become clerks and ahandon the business of their fathers as beneath them. He alluded to the fact that already in Californuia we are to-day looking to the lower clase of foreign immigration for manufacturers, mechanics and laborers in the field. We must learn, and at last are beginning to learn, that the farm and factory are to be the foundations of euccees in this State as in other ones. The lecturer gave a graphic account of the causee which led to the decline of country life, attributed it to defective education, and advocated æsthetical culture as its cure.

The prejudice against "book learning" on agricultural matters, and the old notion about "mother wit and plenty of manure," has passed away and had its day. Inventors, mechanics and newspapers are rapidly bringing about a proper acknowledgment of the benefits of science as applied to the affairs of every-day life, and in onlightening and improving the world. The increasing popularity of agricultural and mechanical colleges ie one of the best assurancee of a rapid change for the better. The lecturer followed with a highly interesting account of the agricultural and mechanical colleges of Europe, especially those of Prussia, where the government at the expense of hundreds of thousands of dollars annually maintains and supports schools and colleges devoted to the practical teaching of agriculture, mechanic and productive arts. Here thousands of scholars, from the sons of nobles to those of the poorest peasant, receive a liberal education at the expense of the government; and some of them do manual labor in the fields and workshops, and attend the schools during their leisure time.

Prof. Carr here reviewed the condition of the same institutions in this country, which are yet in their infancy, and gave a description of what our own State University intends to do, paid a glowing tribute to the Regents for their liberal spirit in throwing open the doors to all, without distinction of sex, and closed the lecture with an eloquent tribute to agriculture as the first foundation of all arts.

Useful Information.

Concord Axles.—For fifty years the name of Concord, N. H., has been familiar on every stage road as a great center for the manufacture of coaches, and, in many sections of the country, famous not only for its coaches, but also for its wagons and carriages of almost every description. Many shops throughout the country may claim to produce as finely finished work, but for durability and perfect action none have more justly deserved the enviable reputation they have acquired than the Concord manufacturers. One very important reason of the superiority of their manufacture has been the quality of the axles used. It is claimed by Messrs. D. Arthur Brown & Co., proprietors of the Concord Axle works, located at Fishorville, a village in the town of Concord, N. H., that the material used by them in the manufacture of axles is of a quality superior to that usually employed for thie purpose, and that by a process of manufacture peculiar to them, their axles wear longer, run truer, and carry a heavier load than any in market. The present firm commenced operations in 1864, the business of the establishment having been previously hogun in 1858. They are now manufacturing from 200 to 250 tons of finished axles, besides about 300 tons of etove and other castings per annum. Their goods are sold extensively throughout New England, in many of the Western cities, and largely in Californuia and along the Pacific Coast.

An Improved Crucible.—A crucible for melting metal has been invented, which consists in providing the ordinary crucible of plumbago or other substance with a flue or passage from the bottom to the top, for allowing the heat to act upon the center of the mass of metal contained in the crucible more directly than it otherwise can. This passage is surrounded by a shell or tube of the same material of which the crucible is made. The inventor also groovee, or indents, or conetructs the sides of the crucible, both inside and out, so as to form projections to interlock with the paste or clay or other substance with which the crucible is coated, to cause the coatings to be retained much longer than they now are, thereby preserving the crucible much longer, and reducing the cost of melting eteel or other metals.

The substitution of slate for boxwood in engraving is found to be specially adapted for engravinge in relief. It is etated that while blocke of slate are easily cut, they will wear as well as electrotypes, and furnish over one hundred thousand sharp impressions without loss of detail. The plates are not affected by oil or water, do not vary with temperature, and never become warped, which is the grand fault with box wood under certain conditions.

Raising Silkworms.—Carret, of Chambery, by a peculiar eyetem of warming a and ventilation, is said to have reduced the period of breeding silkworme to eighteen or twenty days. As an evidence of the advantages which eericulture hae derived from scientific research, M. G. Raulin states that an ounce of the egge furnished by M. Pasteur yield about three times as much silk as an ounce of the ordinary eggs.

A Big eel in a water-pipe stopped a three hundred horse-power engine in Lancaster Mills, Clinton, a few days since.

Good Health.

Doctors and their Fees.

Only quacks advertise "No cure, no pay." All honorable physicians charge for their time and trouble in proportion to their talent and reputation, no matter whether the patient remains sick, or gets better, gets worse, or dies.

Many physicians make a discrimination in regard to these charges, according to the wealth of the patient; and this appears no more than fair, as a poor man is unable to pay as much as a rich man. Not that his life is worth less; it may be worth more, for all that, as the poor man may perform useful labor, while the rich man may be a useless consumer of the goods of creation; but that ought not to cause a physician to charge a rich man less, as the best rule for them is, to let the rich pay for the poor, and to help the very poor for nothing, as all respectable doctors actually do.

The *Medical Gazette* reports that previous to the thirteenth century the law regulated the fee for doctors proportionally to the rank of the patient; so for curing a bishop or local chief, he had forty-two cows, and for a member of the lowest rank only six cows. This was for serious complaints; for slight complaints, it was less in proportion, and if no cure was performed, there was no pay.

Dio Lewis declares that our present system of employing doctors is all wrong, and advisee people to make contracts with them at $200 for each family, and a deduction of two dollars for each case of sickness. This is the Chinese system. There every family of note has its physician, who has a salary of a certain sum per head, to keep them all in good health. The amount of this salary is according to the social condition of the family and the reputation of the doctor. As soon as a member of the family is sick, his share in the salary is stopped, and not commenced again before his health is restored. It is seen that the doctors in China are not encouraged to protract the sickness of rich persone, as is the case with us.

The Use of Camphor.

When the mucous membrane of the nose, frontal sinuses, etc., is affected by catarrh, a strong solution of camphor frequently and for some hours snuffed up the nose, and five or six drops taken internally on a lump of sugar, at first for every ten minutes, then every hour, will usually put a stop to the affection. Ordinary cold and even influenza, if treated in this manner at the *very beginning* of the attack, are generally controlled by the same treatment.

Attacks of incessant sneezing and profuse running at the eyes and nose will generally yield to a strong solution of camphor diligently sniffed up the nose. In summer diarrhœa no remedy is so efficacious as camphor, if employed at the very commencement of the disease; later it is without effect. Its influence over cholera is equally remarkable. Dose: six drops of a strong alcoholic solution of camphor, given at first every ten minutes; afterward, as the symptoms abate, less frequently.

To Avoid the Ague.

Editors Press:—There are a few malarious districts in California where ague or chills and fever are more or less prevalent. A residence of 20 years in one of the most malarious districts of Michigan, and a close observation of cause and effect, convinced me that one of the best preventives to ward off the attack of this troublesome malady, is found in fortifying the stomach with a full, hearty breakfast, as soon after getting up in the morning as possible, and before taking hold of any of the severe labors of the day. W.

Treatment of Footsoreness.—The *Lancet* states that the Inspector-General has directed that every man suffering from feet blistered by marching is to be taken at evening parade to the medical officer, who should cause him to wash his feet, and then to pass a needle with a worsted thread through each blister, cutting off the thread a little distance outside the blister at each side, and leaving a portion in it. The part is then to be rubbed with common soap, the sock put on and wetted over all prominent points, and the soap again rubbed over them freely. When properly attended to, no man should be unable to march the following day on account of blistered feet, unless the cuticle has actually been removed, leaving a raw surface exposed.

Biliousness.

Persons inclined to biliousness should carefully avoid all mental disturbance or excitement at meal time, or just before or after it. It is wonderful with what promptness in some individuals the least mental excitement or disturbance will stop digestion in the stomach; eating too hurriedly; a little vexation because the dinner is not ready or because it is not cooked to suit; being engrossed in some perplexing thought or revolving some wild scheme while eating, are all so many injunctions on the stomach-work of sensitive bodies. Time to eat should be taken, and no more than on the sanctity of the family devotions, should anything else be allowed to encroach. We ought at that time to consign to a momentary banishment all petulance and bad tempers, and be, for the time, smiles and benignity all over.

The digestion of animal foods is not interfered with to nearly as great a degree by mental and nervous causes as that of vegetable origin; hence it is proper to eat quite largely of meats and milk, but they—the meats—should be carefully prepared with regard to digestion.

We cannot but believe that the lining of the stomach which induces many of these attacks, is brought about by too frequent meals. Many do not allow time for digestion and rest for the organism between the meals, a second eating of hearty food is brought for digestion, before the first is fairly disposed of. People ought to arise early enough to take an early breakfast, or else they should take a very light one, and the supper ought to be postponed until at least six hours after dinner.

For bilious attacks of spring we must regulate our diet to the changing of the season. Decrease the amount of fat producing, carbonaceous food consumed; eat less fat meat—better eat none at all; discard the ham—not the eggs, drop off the buckwheat cakes, and put away the syrup pitcher for another year, or use it very sparingly. Bring in instead of these—the eggs, lean meat, milk and vegetables, being always sure to have them cooked with most scrupulous care as to their digestibility. Avoid constipation, and keep the body well clad and protected against the chilling winds of the season.

Replanting a Tooth.—When the tooth is somewhat loose, and painful to bite on, with swelling at the gum, and suppuration, the tooth is taken out; all the diseased parts are scraped from the roots, and it is washed and disinfected in carbolic acid, but those portions of mucous membrane which are commonly attached to the neck of a tooth, and appear healthy, are not scraped away. The socket from which the tooth was drawn is also properly cleaned, and the tooth is put back in its former place, and in a number of cases takes root, and fixes itself firmly in the course of a fortnight, and then becomes as serviceable as the other teeth. This is a remarkable instance of vital force. By the small portion of living tissue left adherent to the tooth, attachment to the jaw is renewed; and though failures occur, there is reason to believe that as in other surgical operations, they will become fewer as the operators acquire experience. The teeth are so important to life and health, that whatever tends to preserve them should be encouraged.

In Fevers.—As long as the patient is able he should sit up out of bed, at least one hour of the day—longer, if he should not be raised while he is perspiring. The bed should be constantly made every day, the sheets and linen should be changed every two days, taking, however, the greatest care that they are dry even as tinder. Nothing more induces to protract a fever than keeping the sick constantly in bed, and withholding a constant and regular supply of fresh linen.

Healthful Effect of Atmospheric Pressure.—M. P. Bert has been experimenting upon the vital effects of varying atmospheric pressure. He finds that a sudden diminution of pressure to the extent of 15 or 18 centimeters speedily produces death, but if the diminution is gradual, the life of mammals may be sustained even under so low a pressure as 12 centimetres. The consumption of oxygen and the temperature of the body diminish with the diminution of pressure.

The cundurango, alleged to be a cure for cancer, is not a tree, as has been supposed, but a vine similar to the grape, and its fruit is about twelve inches long and four in diameter. The sap of the vine is the color of milk, and this is believed to contain the valuable elements of the vine.

Park Commissioners' Report.—We have received from the hand of William Hammond Hall, Engineer and Superintendent of the Golden Gate Park, the first Biennial Report of the Park Commissioners. It is an elaborate document setting forth the contemplated improvements and the actual progress made in laying out and beautifying the grounds, the amount already expended and the halance on hand.

It appears that the eastern end of the Park and the Avenue Reserve have received the first attention from the engineer, and already give evidence of a master hand. In a few months, pleasnre grounds, lawns, conservatories and flower gardens will heautify the landscape, and carriage drives and avenues will meander throngh the Park, in the midst of natural shruhhery and around artificial lakes. We can even now congratulate our citizens on the prospect of a Park that will be second to no other in the United States. San Francisco has the money to make it so, and we have seen New York Central Park.

A New Trade.—Several months since an experimental shipment of doors and sugar pine lumher was made from this port to Melhourne. The last steamer from that port brought news of the result of the venture, which is sufficieutly favorable to warrant further and larger shipments of the same kind. Heretofore, Boston has almost monopolized the Australian market for doors, sash, blinds, and pine lumber, and it is a matter of considerable importance to find that San Francisco will henceforth be able to control a portion of this trade.

Notices to Correspondents.—The communication of C. H. S. will be answered next week. Will our correspondent C. S., who sent us a communication last week send us his address.

On File.—Communication from "Exile," and one from "W. C."

The State Geological Survey—No. 3.

In our last issue we gave some account of the general character and plan of the much needed map of Central California, and the progress made by the survey towards its completion.

During the summer and autumn of 1870, while Messrs. Hoffman, Craven and Goodyear were employed upon the general topographical and geological work demanded for the construction of this map, Messrs. Amos Bowman and W. H. Petee were engaged in a very different department of the work, and one which possesses a peculiar interest for the people of the mining regions. This was a careful, detailed and systematic study of

The Ancient Auriferous Gravel Deposits,

Which form our hydraulic and deep tunnel mines, together with such investigations as time and means would permit of the auriferous quartz veins, and the more detailed geology of the bed-rocks and the volcanic formations of the Sierras. In the course of the season, these gentlemen thus completed a minute investigation and careful survey of the region between the North Fork of the Americau and the Yuba rivers.

The expense of all this field work combined with the costs of office work, and of printing and engraving, which during that year were also large, ran considerably in excess of the regular $2,000 per month allotted to the survey. Hence it became necessary to largely curtail the field-work during the subsequent year of 1871. Nevertheless, Mr. Goodyear after finishing up his notes of the work of 1870, and making a full investigation and report upon the quicksilver mines of the State, again took the field in May, 1871, in order to continue the detailed survey of the gravel mines in the country to the southeast of the North Fork of the American. From that time until the 7th of December, 1871, he has been constantly engaged upon this work, and has extended his investigations southeasterly as far as the Mokelumne river.

The Character and Purpose of this Work.

The objects of this investigation of the auriferous gravel question are, first, to ascertain the definito location and the approximate extent and magnitude of the masses of auriferous gravel, and to acquire such reliable information as can be obtained respecting their past and present yield, as furnishing the only data from which we can form any trustworthy estimates of what they may he expected to yield in the future. Second, to lay down the gravel upon the map, on a scale of two miles to oue inch, and thus exhibit clearly to the eye its situation and extent, showing hy different colors the localities where its surface is uncovered and where the mass can be worked hy hydraulic, and the localities where it is deeply buried beneath heavy masses of volcanic matter, and can only be worked by tunnelling and drifting. Third, to determine its exact geological age, *i. e.*, when, and at what period it was, in the history of the formation of the mountains and valleys of California, that this gravel was accumulated and laid down, what trees then grew, and what curious animals then lived in the country. Fourth, to settle, if possible (and possible it is), the much vexed questions of where this gravel came from, how and by what means it has been spread so far and wide over the country, here perched upon the topmost crests of mountain peaks and ridges, there hnried a hundred fathoms deep, here but a single foot, and there a hundred yards in thickness, and presenting such endless variations, in fact, such seemingly chaotic confusion in all the details of its distribution and arrangement, as to have haffled with its riddles, not simply the miner, but the scientific world as well, for twenty years; how all these things were accomplished, whence came the gold that this gravel contains, and how was it concentrated there. And lastly, why did this gravel cease to accumulate, and what are the wondrous changes that have since been wrought in the whole face of the country, and what were the causes and the *modus operandi* of those changes?

These are the objects which this survey of the gravel is meaut to accomplish, and these are the questions which it is expected to answer. The work is not an easy one. Only those who are acquainted with the deep gravel mines can understand the complexity of the puzzle they present, and those who are most familiar with them can best appreciate the difficulties of the problem. It has never yet heen satisfactorily solved. The miner has worked and studied these mines for twenty years.

For 20 years California has been visited from time to time by leading scientific men from almost all parts of the civilized world, who have come, and looked at the gravel and gone away and theorized upon it. And almost every agency, that is capable of moving rocks, from salt water oceans to enormous fields of ice, has been called in, to account for the presence and distribution of the gravel. Yet this one problem has defied them all. It well illustrates, therefore, the value of two years of earnest systematic work devoted to a definite purpose by trained and skillful hands as compared with 20 years of cursory flying trips by even the ahlest men, when it is added that this two years' work of the survey has in all prohahility furnished the means at last for the true solution of this complex problem. We do not wish to be understood as saying that the survey has succeeded in unraveling all the intricate details ot this problem. This was not to he expected. It will yet take many years of careful and laborious investigation to accomplish this, if indeed it can ever bo done. But we believe that this two years' work has furnished the key by which alone the mystery can he solved; the means of developing the only general theory which can by any possibility account for all the complex phenomena. And this is more than 20 years had previously effected.

Conclusion.

The practical value of this map of the gravel when completed will he readily understood hy all. The value of the mass of detailed information which has heen gathered respecting not simply the gravel mines, hut also the quartz veins, the marhle, the slate, the granite, and the whole geology of that portion of the country, when revised and presented in clear and intelligible shape to the people, as it can he in a little while if the means are furnished, will be even greater still.

We have by no means exhansted this subject, and we may refer to it again hereafter. But we think that enough has already heen said to show that aside from all the purely scientific portion of the work, there is much of the deepest practical value, aud of no little importance to the people at large in the State Geological Survey of California. It is not simply in the hands of competent and ahle men, hut of earnest and practical workers too. Incomplete as it is, it has already saved far more to the people of this State than it has ever cost them, and its value when once completed will not only be great and lasting, but will be felt and acknowledged hy all.

We do not ask in conclusion, therefore, whether the Legislature are willing to incur the odium of the scientific world, as they would surely do hy the stoppage of this work now; hut we do ask in all earnestness whether the people of California can afford, in a practical and pecuniary sense, to have this great work stopped today, and all the material so nearly ready for publication, thrown away?

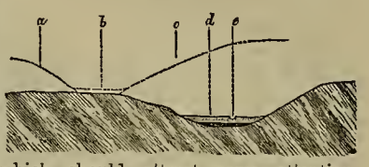
Hints to Miners—No. 7.

Formation of Deep Placers—Concluded.

Some of these descriptions and suggestions may appear trivial to persons not practically acquainted with gold mining, or who have never turned their attention to geological investigations, but they are connected with problems which mining managers have often to solve, or fail in the work they have in hand; and geologists find in these subjects as many interesting and difficult questions as in any hranch of science. "Smyth's Gold Fields of Victoria," from which this article is condensed, as before mentioned, is a work which should he better known than it is, heing one that contains a large amount of valuable information.

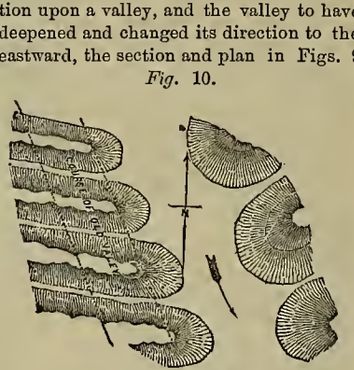
Some of the agencies supposed to have been busy in effecting the change of position of a main drainage course have already been mentioned, but there is another

Fig. 9.



which should attract some attention, namely, the tendency of hills to wear away more rapidly in proportion to the greater inclination of their sides, by the increased scour of the drainage water upon the steeper slopes, and this action would be probably accelerated where these slopos are most exposed to the prevailing wet winds. Well, supposing the several agencies named to have heen in active operation upon a valley, and the valley to have deepened and changed its direction to the eastward, the section and plan in Figs. 9

Fig. 10.



and 10 would probahly represent the effect of the alteration. In Fig. 9, *A* represents the old hill; *b*, old valley; *c*, old hill; *d*, new valley, and *e*, the existing watercourse. The newer valley would occupy a different position and the course of the old valley would be found to cross the summits of the newly-formed hill spurs. This and other irregularities in the direction of the alluvial deposits may be reasonably set down to some of the causes already explained.

A hrief recapitulation of some of the principal causes that seem to have been in operation in effecting the great changes of position of many of the valleys is as follows:

1. The greater disintegration of rocks that are more argillaceous in their composition than others in tho same watershed area.

2. The tendency of rocks to wear chiefly in the direction of the dip of the strata, through a more direct and penetrating influence of rains, frost and heat, upon the edges that are most exposed.

3. The more rapid disintegration of those hills that have the steepest incline, owing to the rapidity of the drainage, and the increased scouring action of the rains upou their slopes.

4. The diversion of the drainage from one valley to auother of less elevation, by the erosion of a channel through the dividing ridge lying between them.

5. The scouring action of drainage

waters from tributary gullies in a lateral direction across main valleys.

Much has been said and written respecting the position in which gold is found in the drifts. In some strata it is distributed throughout from the surface to the bed-rock—in other places it is seldom found in appreciable quantities except in the thin layer of quartz pebbles and drift immediately overlying the bed-rock. In many parts false bottoms occur; strata of clay and sand and drift are sunk through, for 15 or 20 feet, to the auriferous drift, which is taken out and washed. A miner perhaps ignorant of the usual mode of occurence of gold in the lead whore there is this arrangement of strata—breaks through the false bottom, and sinks a shaft down to the true bed-rock and finds there another auriferous layer.

How does it happen that the gold invariably finds it way to some stratum impermeable to the surface waters? That, as a rule, it lies on the bed-rock? We know that surface water—rain water is rapidly absorbed by the thin drifts overlying the bed-rock; that by this reason of the lithological character of the underlying rocks a covering of clay is soon formed on them that, in fact, they *puddle* themselves; and that the water derived from the surface finds its way along the course of the bed and through the drift, very much in the same way as it does in a running creek. Whatever influence, therefore, the surface waters in the drifts may have in determining the position of the particles of gold, it is certain that it does not continue to any appreciable depth in the bed-rock, and must cease as soon as an impermeable stratum is reached.

A Line of Steamers for the Transmission of Ores to Europe.

Mr. John Boyle, of England, is about starting a line of steamers to run between New York City and Cardiff, Wales, for the purpose of carrying the refractory ores of this State to that country for reduction. The Virginia *Enterprise* of Dec. 30, has made an extract from a letter to Mr. Louis Janin from Mr. Boyle in relation to the new enterprise. It will, perhaps, interest the miners of Eastern Nevada, where most of the smelting ores are produced: "The object of my visit to America is the establishment of a line of steamers between New York and the South Wales ports in the Bristol Channel. Cardiff is the port to which the vessels will sail, it being the only one in that part of the country at present capable of admitting first class steamers of the size we are building. However, we intend to carry from America at the same rate of freight to all the Bristol Channel ports, so that this line of steamships may be said to be a direct line from New York to Swansea, among other ports. The consignments brought to Cardiff for Swansea are to be immediately transhipped into our own coasting steamers and forwarded thither without further cost. I believe this fact will interest all engaged in the shipment of ores to Swansea, or England generally, and who have hitherto been sending them to Liverpool. This will no longer be necessary or expedient; and inasmuch as they are now beginning to smelt copper and silver ores at Cardiff, it seems likely that the course will come to be to consign direct to Swansea or Cardiff, the ores which are now sent to London, and thence round by sailing vessels to Swansea.

It is evident that the saving of this last item of cost, namely, the freight, 12s. 9d. from Liverpool to Swansea, will add considerably to the value of the ores, and tend to benefit those engaged in this business. I think if the American railways can be induced, in their own interests, to reduce their rate to a proper figure, the refractory ores may be taken profitably to Europe, and thus a new branch of mining operation and adventure be happily inaugurated. And in this, my line of steamers will be a valuable contributory part. In this view I am in communication, or shall be shortly, with that section of the railroads whose action at present is the greatest obstacle to the transmission of ores."

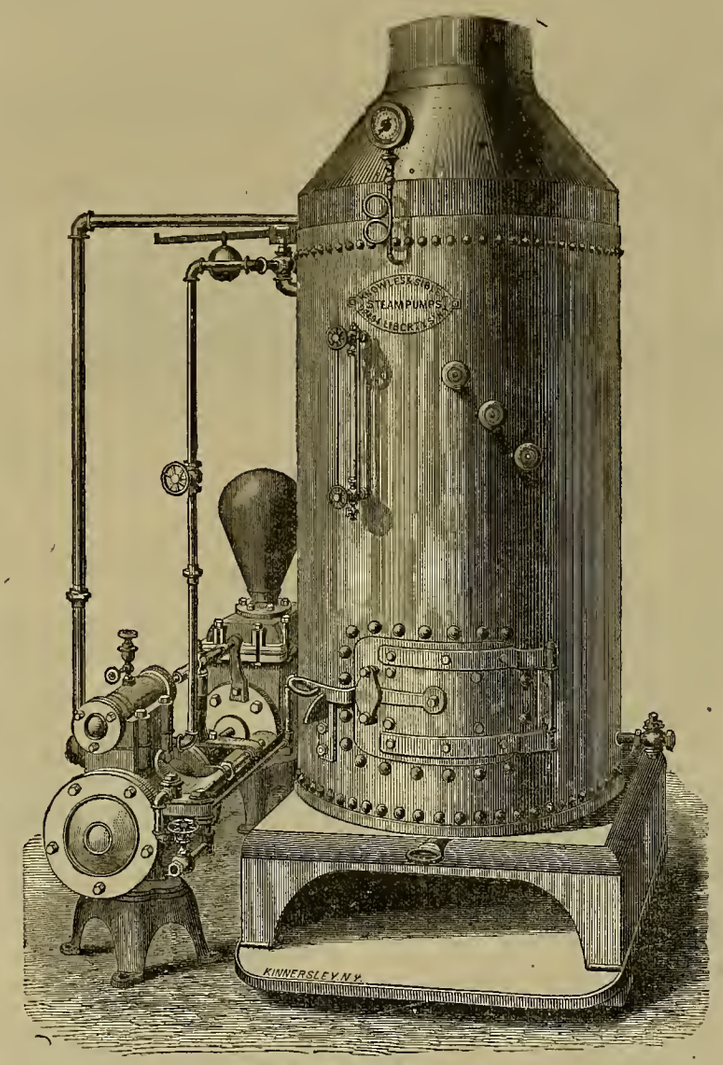
Academy of Sciences.—A meeting of the Academy of Sciences was held on Monday evening last, but no business of general interest was transacted.

Knowles' Patent Steam Pump.

We give, herewith, a representation of an old and well-tried portable steam pump—compact, effective and durable, and at the same time a very simple machine for forcing water from springs or wells to hotels, private residences, railway stations, etc. It is also specially adapted to irrigation purposes, raising water for stock, or for any other purpose for which water is required to be raised to a great hight. Several of these machines have already been sold in this State for irrigation purposes.

The machine is portable, calculated to be placed at or near the point from which water is to be taken, and force it to any distance that may be required.

Its simplicity is such that very little skill is required to operate it; it has no cranks, fly-wheel or dead-points, and is always ready to start as soon as steam is turned on.



KNOWLES' PATENT STEAM PUMP.

It is made in regular sizes, so that all parts of any one machine of a given size will fit in its place in any other machine of the same size; thus in case of wear or accidental breakage, an order to the agent in this city by mail or telegraph can be promptly filled without the necessity of visit in person or the assistance of a machinist to adjust the broken part.

The headquarters of the Company are at 92 and 94 Liberty street, New York. One of the proprietors of this paper recently visited the warehouse in that city, and had the pleasure of a personal inspection of the extensive business done by the firm in this line, and of the admirable order and system with which everything is accomplished. The company is said to have one of the largest stocks of pumps in the country—embracing all sizes, and calculated for every conceivable character of work.

The pump herewith shown took the highest premium at the two great Mechanics' Fairs in the country in 1869—the Massachusetts Fair at Boston and the American Fair at New York.

The pump was also exhibited at the late Fair of the Mechanics' Institute in this city, where, after a trial of steam pumps, by a Committee of Five of the most thoroughly practical machinists on this coast, it was awarded the first premium over all competitors—the committee reporting that it lost but 11¼ per cent.; while some pumps which were tested lost as high as 40 per cent.

It also received a diploma and medal at the last State Fair at Sacramento, which evidences of merit may be seen at the company's offices in this city.

The Central Pacific Railroad has 19 of these pumps in use along the line of the road for fire engines and for pumping water for shop and station use.

A. L. Fish, at No. 9 First street, is the agent for their sale in this city.

California Brandies.

The *Wine Dealers' Gazette* for January, commenting on the values and qualities of California Brandies, undoubtedly comparing them with those of other countries, arrives at a favorable conclusion in relation thereto, and adding a cheering word for the producers; it says: A few of them understand their business well, and make an article of brandy that will command a sure and profitable market after they shall have had time to gain the reputation which they deserve. Many circumstances give our State peculiar advantages for the production of brandy, and our people will not neglect a resource so important. When a more liberal policy has lightened the burdens and vexations now imposed on the distillers, when experience and study have improved their skill, and wealth and reduced interest enable them to ripen their brandy before selling, will drive the best French cognacs from the markets of the Western world.

The Overland Tea Traffic.—In 1870 only 1,700,000 pounds of tea passed over the Central Pacific Railroad; while 15,000,000 pounds passed over that road during the year just closed.

Soap.—The soap trade is improving, in view of the prospect of an early advance in the article on account of the recent advance in sodas and high price of rosins.

Quartz in Granite.

A good many practical miners are prejudiced against quartz ledges that are found in granite and pronounce always in favor of those located in slate formation. They say that their general experience is that although many rich ledges exist in granite formation, that they are apt to pinch out and become poor as the depth increases. This prejudice has discouraged many owners of ledges from fully developing their properties, and generally as soon as they showed signs of decrease in width, as all ledges do in places, the mines would be abandoned.

As a practical illustration of the fallacy of this prejudice, as a general conclusion, the Grass Valley *Republican* cites the instance of the Pennsylvania Mine which paid well at the surface, but began to lessen in yield as it went down. Old practical miners at work in the mine shook their heads when questioned about the Pennsylvania, and said it was "petering out" like all mines in granite. The mine was considered by thorough practical men, who had worked in it for years, as property that would never pay for working. But, there were a few men acquainted with it that believed that by woking 100 or 200 feet deeper through the "horse" or barren quartz, better ore could be reached. Mr. Harry Helm after spending about $10,000 in sinking and putting his incline down to a depth of nearly 500 feet from the surface struck one of the best paying ledges in Nevada County. The levels run since Mr. Helm sold out disclose a continuous lead with as perfect wall rock as was ever seen in a quartz mine. The rock pays with great evenness, and yields from $40 to $50 per ton.

In the vicinity of Nevada City the mines are mostly in granite, and many of them paid largely for the first hundred feet from the surface, but when much deeper than that would either pinch out or the ore would decrease in value. The developments in the Pennsylvania go to disprove the generally preconceived theory that "granite ledges" do not carry gold to any great depth, and the *Republican* suggests that some of the other mine-owners follow the example set them and sink deeper on their mines instead of giving them up.

Whelpley & Storer's Pulverizer.

We recently visited the Mechanics' Mill Building, corner of Fremont and Mission Sts. to witness the operation of the Whelpley & Storer Pulverizer. This Pulverizer is constructed solely for the reduction of sand or gravel to dust and cannot be used as a crusher. It consists of a series of paddles which revolve in an iron drum or cylinder and generating vortices of air which reduce the gravel and sand into dust by the mutual attrition of the particles. A suitable feeding device is provided, and by means of a fan blower the dust is carried to a receiving chamber as fast as produced. We believe that this is the first time this machine has been put into actual operation on this coast although it has been long used successfully in the Eastern States for pulverizing ores, manganese, bone, plaster, paint stuffs, shellac, grains, etc. A breaker is used in conjunction with the pulverizer so that all the materials shall be less than three-fourths of an inch, when fed into the pulverizer. The machine has been successfully employed to pulverize coal and feed it to the furnaces of steam boilers, with, it is said, a saving of about thirty per cent. of the fuel. The small machine now here is intended for this purpose, but a larger one for quartz pulverizing will soon be set up, when our millmen can inspect it. We hope in a future issue to illustrate the machine when we shall give a more extended notice of its working.

DOMESTIC ECONOMY.

Cooking and Architecture.

Perhaps oue of the greatest treats that a cook could enjoy is to be served with a dinner cooked by some one else. The reason of this is that the coustant smell of cooking nauseates the stomach, making it, by the sympathetic action of the several nerves of the system, disinclined to receive what it has so long anticipated through the action of the senses. In some instances the smell of dinner will be perceivable in other parts of the house to a greater extent than in the kitchen. To a delicate person this is sufficient entirely to destroy the appetite, and it is due solely to defective construction.

The cook is too often blamed when the architect is in error; and, while few know where to assign the fault, fewer still know how to remedy it; but it may be taken for granted that the evil will not disappear from amongst us until the art of house construction is based upon a more scientific principle than it has hitherto attained. Art and decoration and the convenient arrangement of accommodation occupy in the present day far too much of the consideration of the architect; whilst sanitary arrangements are neglected, and the healthfulness of buildiugs suffers in consequence.

In order to arrive at a true appreciation of the causes that lead to the kitchen being a nuisance in the house, instead of, as it should be, the meaus of imparting pleasure and comfort, we must consider first what is a smell and how it is conveyed. A smell, then—and here we are referring, it will be understood, to a smell that ought not to exist—is matter in a wrong place, and consequently it is dirt; and not only is the smell of cooking when it pervades a house, dirt, in a scientific sense, but it is so, absolutely.

The smells arising from cookiug, consist of minute particles given out from food of all kinds, owing to the partial decomposition which takes place duriug the application of heat and which are carried off and mixed with the surrounding air by steam or other vapors arising therefrom. With a properly constructed kitchen range and flue, these will all be conveyed up the chimney, and carried away from the house. In such a case they are harmless and become immediately, so to say, deodorized by admixture with a prepouderatiug amount of atmospheric air.

When, however, they are permitted to escape into the house, they do not meet with a sufficient quantity of air to render them inocuous; and, upon condensation of the vapors by which they are conveyed, they will settle upou the interior walls aud gradually cover them with a coating of grease and vegetable matter. These, if not coustantly removed, will accumulate, and in time decompose, giviug off still more objectiouable and unhealthy smells, but which are not so noticeable in consequence of the more powerful odors arising from a contiuuance of that evil from which they first had their origin.

It will repeatedly be found that the smell of cooking is stroug in other parts of the house and especially upon the floor immediately above the kitchen, whilst the kitchen itself is apparently free—or almost so—from the inconvenience; and the reason of this is, upon a little consideration, made perfectly clear and intelligible.—*Food Journal.*

Powders, Perfumes and Flavoring.

A charmiug recipe for scent powder to be used for wardrobes, boxes, etc., far finer than the mixtures sold at shops, is the following: Coriander, orris root, rose leaves and aromatic calamus, each one ounce; laveuder flowers, two ounces; rhodium wood, one fourth of a dram; musk, five grains. These are reduced to a coarse powder. The sceut on the clothes is as if all fragrant flowers had been pressed in their folds.

A perfume for uote paper said to be that used by the Queen of England is made of powdered starch, one half ounce; ottar roses, teu drops. Put this in bags and keep in the desk with paper.

All delicate flavors may be improvised by keeping the delicate substance in deodorized alcohol. How deodorized? filtering through animal charcoal or bone black in powder, the black may be used many times over; a thick flannel bag with wire on the top will answer for a filter. Fill it with the black dust and pour the alcohol in it, leaving it to settle through. Have wide month bottles with glass stoppers ready, and fill with alcohol; then fill with powdered lemon peel, peach leaves, almonds, slices of pineapple, raspberries or fresh cherries, and she will have a finer assortment of flavors than any manufacturer will furnish her. If she wishes, however, flavors which are out of reach, it is best to use compounds of which she is not ignorant.

Banana may be imitated with oil of jasmine and a very little tartaric acid.

Strawberries with a strong tincture of orris aud a very little acetic ether—one ounce of the tincture and oue eighth of ether.

Stroug tiucture of orris root resembles raspberry.

Pineapple is made of butyric ether, the acid itself coming from the transformation of rancid butter by a chemical process.

Very little of these preparations is needed to give the desired flavor.

Four ounces of the tinctures mentioned will supply flavor enough for constant use during an eutire summer.—*Harper's Bazaar.*

COOKING HAM.—The late Gen. Winfield Scott, an acknowledged authority in the culinary art, was of opiuiou that few cooks knew how to cook a ham, because they did not boil it until soft enough to be eaten with a spoon! A great artist once told the writer never to serve a ham under oue year old; it was theu to be soaked all night in soft water, and, if possible, running water; it was theu to be put on the fire in a large pot of cold water, and slowly boiled at least twenty minutes for ever pound it might weigh; and as for skinning a ham, he held it to be an outrage, a sacrifice to mere appearance, which no sensible man should be guilty of. If your ham is to be served cold, as is always done iu Europe, it should be souzed in snow or ice-water immediately after coming from the pot, because the sudden cold arrests the flow and escape of the juices.

COOKING STEAK.—A lady correspoudeut of the Ohio *Farmer*, who knows, advises—First, get tender steak; no matter what part it is from, so it is tender; let it be three fourths of an inch thick. Cook it at the last moment, when every other dish is ready to be set on the table. Use a wire broiler if you can get one. Have a hot fire and when it is crisped on one side, turn it over and crisp it on the other. If fat drops and blazes, throw a pinch of salt on the coals. Don't *do anything else* while it is cooking. Have your plate hot and a lump of butter melting in the bottom. Put butter on the upper sides and eat it in five minutes after cooking. More steak is spoiled by slow cooking thau by any other fault.

Mechanical Hints.

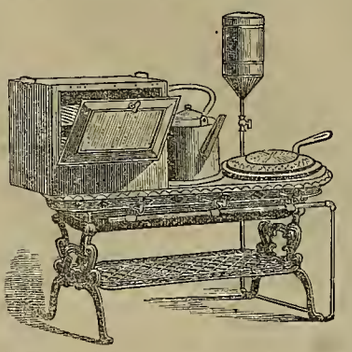
A NEW ZINC PAINT.—M. Artus, connected with the Belgian Zinc Company, has prepared a zinc white, made up with silicate of potassa or soda and used to paint zinc and other objects. The cement is something in the nature of a cement or artificial stone, and will withstand the action of the air, sun and water. It can be employed to advantage ou metal roofing, also on plaster, brick and wood. Its chief value will be in rendering wood, paper and tissues uninflammable, and for this purpose ought to be generally known. The value of the mixture for cements will also attract attentiou to it, and we shall probably hear of its extensive use as a constituent of artificial stone. The heat of rooms under roofs painted with this mixture was found to be 10 degrees less than under the painted metal.

SALT WATER IN STEAM BOILERS.—Engineers usiug salt water in their boilers should be provided with a *Salinometer*, having four made points measured on the scale, one for fresh water, one for sea water (water containing 1.32 of salt) one for water containing 2.32 of salt aud one for water containing 3.32 of salt. When the specific gravity has iucreased from the mark 1.32 to 2.32, it is a proof that the proportionate quantities of salt and water is such that the amount of salt is double that of sea water. This is considered the limit; and wheu this point is passed, it is time to blow off water. As a saturated solution of salt in water contains 37 per cent. of salt, or about one-third, it is clear that engineers blow off long before the point of saturation has beeu reached.

PAPER BOX MANUFACTURE.—There were iu 1840 but five paper-box manufactories in this country, with an aggregate business of $20,000 per aunum. Single establishments now turn out millions of dollars' worth of goods annually, and it is said that an average of seventy-five new shops are started every year.

THE IMPROVED

AMERICAN VAPOR STOVE.



No Wood, Coal, Smoke, Ashes, Stovepipe nor Chimneys, and Perfectly Safe. Economy and Convouience combined.

THE BEST PERIODICALS OF THE DAY.
THE GREAT
ENGLISH QUARTERLIES
AND
Blackwood's Edinburgh Magazine,
REPRINTED BY
The Leonard Scott Publishing Company,
140 Fulton Street, New York,
At about one-third the price of the originals.

THE EDINBURGH REVIEW,
THE WESTMINSTER REVIEW,
THE LONDON QUARTERLY REVIEW,
THE BRITISH QUARTERLY REVIEW,

Published Quarterly—January, April, July, October—
AND
Blackwood's Edinburgh Magazine,
(A fac-simile of the original). Published Monthly.

TERMS OF SUBSCRIPTION:

For any one Review	$4 00	per annum.
For any two Reviews	7 00	"
For any three Reviews	10 00	"
For any four Reviews	12 00	"
For Blackwood's Magazine	4 00	"
For Blackwood and one Review	7 00	"
For Blackwood and two Reviews	10 00	"
For Blackwood and three Reviews	13 00	"
For Blackwood and the four Reviews	15 00	"

Postege, two cents a number, to be prepaid by the quarter at the office of delivery.

CLUBS.

A discount of 20 per cent. will be allowed to clubs of four or more persons. Thus: four copies of Blackwood or of one Review will be sent to *one address* for $12.80; four copies of the four Reviews and Blackwood for $43, and so on.

To clubs of ten or more, in addition to the above discount, a copy gratis will be allowed to the getter-up of the club.

PREMIUMS.

New subscribers for the year 1872 may have, without charge, the number for the last quarter of 1871 of such periodicals as they may subscribe for.

Or instead of the above, new subscribers to any two, three, or four of the above periodicals, may have, as premium, one of the 'Four Reviews' for 1871; subscribers to all five may have two of the 'Four Reviews' for 1871. Neither premiums to subscribers nor discount to clubs can be allowed unless the money is remitted direct to the publishers. No premiums can be given to clubs.

To secure premiums, it will be necessary to make early application, as the stock available for that purpose is limited.

Circulars with further particulars may be had on application.

IMPORTERS OF AND DEALERS IN

ASSAYERS' MATERIALS,

Chemical Apparatus and Chemicals,

Druggists' Glassware and Sundries,

PHOTOGRAPHIC GOODS, ETC.,

512 and 514 Washington street, SAN FRANCISCO.

We would call the special attention of Assayers, Chemists, Mining Companies, Milling Companies, Prospectors, etc., to our large and well adapted stock of

ASSAYERS' MATERIALS

—AND—

Chemical Apparatus,

Having been engaged in furnishing these supplies since the first discovery of mines on the Pacific Coast.

WE ENUMERATE IN PART:

Assay Balances—L. Oertlings, London.
Assay Balances—Becker & Sons, Antwerp.
Chemical Balances—Becker & Sons, Antwerp.
Ore or Pulp Balances—Becker & Sons, Antwerp.
Assay Weights—Grains and Grammes.
Bullion Balances and Weights.
Humid Assay Apparatus.
Iron Furneces—Improved, Lined with Fire Brick for Cupelling and Melting.
Tongs, Muffles, Cupel Moulds, Assay Moulds, Scorifiers, Roasting Dishes, Annealing Cups, French Clay, Assay Crucibles, Hessian (or Sand) Crucibles.
Dixon's Celebrated Black Lead Crucibles and Covers—all sizes.
Assayers' and Chemical Glassware and Assayers' Hardware—a full assortment.
Steel Stamps for hair cut to order.

ACIDS AND CHEMICALS.

Acid in carboys and bottles, commercially and chemically pure.
Bi Cerb. Soda, Borax, Bone Ashes, Litharge.
Assay Lead in bars, rolled and granulated.
Black Oxide Manganese, Sodium and Sodium Amalgam, Sulphate of Copper, Quicksilver, and all Chemicals and Reagents required by Assayers and Milling Co.'s.

☞ Our Gold and Silver Tables, showing the value per ounce Troy at different degrees of fineness, and valuable tables for computation of assays in Grains and Gremmes, will be sent upon application.

24v23-tf JOHN TAYLOR & CO.

Varney's Patent Amalgamator.

These Machines Stand Unrivaled.

For rapidity pulverizing and emalgameting oree, they have no equal. No effort has been, or will be spared, to heve them constructed in the most perfect manner, and of the great number now in operation, not one hee ever required repeirs. The constant end increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steem directly into the pulp, or with steem bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the apperture and between the grinding surfaces.—Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Setlers made on the same principle excel all others They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly end completely absorbed.

Mill-men are invited to examine these pans and setlers for themselves, at the office, 229 Fremont Street, San Francisco.

UNION PACIFIC RAILROAD.

Running from Ogden, Utah, to Omaha, Nebraska—over one thousand miles, without change of cars.

MAKING DIRECT CONNECTIONS

AT OGDEN with the CENTRAL PACIFIC R. R. (from San Francisco); also with the Utah Central R. R. to Salt Lake City.
AT CHEYENNE with the DENVER PACIFIC R. R., for Denver City and the Mining Districts of Colorado.
AT OMAHA, for Chicago, Eastern and other cities, with the Chicago and Northwestern; Chicago, Rock Island and Pacific; Burlington and Missouri River; St. Joseph and Council Bluffs Railroads; also, for St. Louis and all Southern cities.
EXPRESS TRAINS RUN DAILY.—The U. P. R. R. use the Westinghouse patent air brake; Miller's patent trussed platform and chastic car-coupler; and the most approved construction of cars for the comfort and safety of passengers.
PULLMAN'S MOST MAGNIFICENT PALACE SLEEPING CARS attached to express trains.

T. L. KIMBALL,
General Passenger Agent, Omaha.

LUBRICATING OIL,
THE BEST IN THE WORLD!

The attention of the public is called to GRUBER'S NEW PATENT LUBRICATING OIL.

For running Machinery of all kinds it has no equal.

It will not gum, and runs perfectly smooth, cool and clean.

This OIL offers special inducements to Farmers, Livery Stable Keepers, etc.

It will be found far Superior

To any other Oil or Grease now in use, for Carriages Wagons, and all kinds of Farming Machinery.

Mill-men, Printers, and all others having occasion to use a Lubricator, will find a decided advantage in using this Oil—one gallon being equal to two of the best Oil in the market.

Perfect Satisfaction Guaranteed
OR MONEY REFUNDED.

Orders per Mail or Express will receive prompt attention.

Mining Matters.

The *Commercial Herald* in its annual review of mining matters says that there can be no question but every thing wears a most cheering aspect, and that the product for the coming year will prove to be unusually large. When we take into consideration the entire situation—the immense gains we have now made in the business of mining; the improved processes and machinery lately introduced, coupled with the great number of new reduction works erected, and the certainty of ample water supplies the approaching season, we find here an aggregate of recently acerning advantages that warrant us in predicting for the current year a yield of the precious metals equivalent to eighty-five or ninety millions of dollars, and should nothing transpire meantime to mar the preseut prospect, there would be little ground for surprise should the product reach a hundred millions hy the end of the year.

Everywhere new ore-crushing mills have been erected, the most of them of large capacity, and uearly all capable of doing better work than the average of those before put up. Improved furnaces have been built for roasting the rebellious ores and a great number of smelting works constructed in the base metal districts. In the ditches and reservoirs built in this State the past year, our water-supplying facilities have been increased fully twenty per experienced—snch aid having, in fact, never cent. while capital the, most powerful auxiliary of all, has come to our assistance, with a freedom and readiness never before before been so fully deserved. With all these helps, and the many new discoveries being made and rich mines constantly developed, we feel confident, that, with no untoward turn of events, there will be gathered from the mineral regions west of the Rocky Mountains a hundred million dollars with in the next twelve months.

Dividends, Profits, Etc.

With this free production, the profits arising from mining operations the past year have been correspoudingly large, leading to liberal investment in stocks and properties of this kind, causing the latter to advance steadily, and, in some cases, with extreme rapidity. Many of the older mines, which had for a long time been worked with little or no profit, have been rescued from the assessment and restored to the dividend-paying roll. Others, which had never before contributed anything toward the cost of their development, have begun to yield pay-ore, and even afford in same cases handsome returns; while still another class, that had heen struggling for years with an adverse fate, their stock depressed to mere nominal figures, have advanced many hundred per cent., and that without undue inflation, there being, to all appearances, a good margin for them to further appreeiate on their merits.

Several new mines, some of them only discovered, or at least brought to a productive condition, within the year, have already yielded large and profitable returns, sufficient, in some instauces, to have reimbursed their purchase money, with cost of plant and other improvements. This has been the case with a number of mines in Nevada and Utah, while almost all the early locations on the Comstock Lode have so improved in appearance or actual ore production as to greatly enhance their valne. The Crown Point and Belcher grounds, which, a little more than one year ago, could have been bought for less than one hundred thousand dollars, are now selling at rates that would aggregate more than three million dollars each. Nor are these rates at all extravagant, such large hodies of high-grade ore having been developed in these mines as fully warrant them. Already these companies are paying euormous dividends, and it is qnite probable that their net profits will amount the current year to several millions.

Mining Accidents.

Geo. W. Rogers, working at the Belcher mine, had his leg broken on the 8th inst. by the collision of two cars on a switch, whereby one of them was thrown upon him.

John Ryan fell from a scaffold at the North Star mill last week, and severely injured his back and spine.

John McClafferty fell into a shaft of the Big Gun claims, at Michigan Bluff, recently, and died from the effects of injuries received.

W. W. Clark, while working in his claim on the north side of Roach Hill, was suddenly swept out by a land-slide which started from the surface at the back part of the claim and passed through where he was standing holding the pipe. He was carried over a high precipice, down a steep ravine which leads into the North Fork of the American river. The body has not been found. Mr. Clark was 49 years of age, and from the State of Illinois.

John Larimer, proprietor of Larimer's mill, while adjusting somethiug in the battery, had his left hand badly crushed by one of the stamps falling on it.

New Incorporations.

Hercules S. M. Co.—Jan. 10, 1872. Capital stock $3,000,000 in 30,000 shares. Trustees: Henry Raymond, C. P. Hall, C. L. Roe, John Bisanz, Julius Ordway.

Pioche Tunnel Co.—Jan. 8. Capital stock $3,000,000 in 30,000 shares. Trustees: Geo. Hearst, F. A. Benjamin, Samuel Linktou, E. Skerritt, H. C. Kibbe.

Central Hydraulic M. Co., Jan. 12. Capital stock $1,200,000 in 12,000 shares. Trustees: W. H. Knight, Sam. B. Drury, H. C. Lee.

Union Hydraulic M. Co.—Jan. 9. Capital stock $3,000,000 in 30,000 shares. Trustees: Dexter Tafft, Edmund Green, R. E. Brewster.

South Emma M. Co.—Jan. 10. Capital stock $3,000,000 in 30,000 shares. Trustees: J. E. de la Montague, Delos Lake, B. F. Sherwood, M. Mayblum, Cornelius O'Counor.

Oakville Quicksilver M. Co.—Jan. 18. Capital stock $300,000 in 3,000 shares. Trustees: E. N. Boyntou, S. Hutchinsou, O. P. Southwick.

Floral Sprino Water Co.—Capital stock $200,000 in 2,000 shares: Trustees: J. R. Wilson, W. M. Subbock, F. F. Coffin, M. J. McDonald, C. H. Hobbs.

May Henrietta First North Ex. Co.—Jan. 10. Capital stock $2,000,000 in 20,000 shares. Trustees: Orville Strong, J. B. Bidleman, S. D. Woodhull, Geo. D. Nagle, Samuel Purdy.

Moreau Machine Factory,—Jan. 6. Capital stock $500,000 in 5,000 shares. Trustees: Isaac Jessup, W. B. Isaacs, Samuel Hill, A. Rosenfield, J. W. Stow.

Meetings and Elections.

Amador Mining Co.—Jan. 15. Trustees: D. D. Colton, M. S. Latham, A. K. White, Fred. A. Hill. Subsequently David D. Colton was chosen President; Milton S. Latham, Vice President; Fred. A. Hill, Secretary; John A. Steinberger, Superintendent.

Raymon & Ely M. Co.—Jan. 15. Trustees: Al. Bull (President); W. H. Raymoud, C. J. Brenham, L. A. Booth aud A. K. P. Harmou. Andrew J. Moulder was retained as Secretary and C. W. Lightnes as Supt.

San Francisco Gas Co.—Jan. 15. Trustees: Peter Donahuo (President), J. A. Donahue Vice-President); John Parrot, J. D. Walker and Charles E. McLane. J. G.Eastland, was continued as Secretary.

Gold Hill M. and M. Co.—Jan. 16. Trustees: John H. Turney (President), P. G. Venard, L. Imhaus Friedberg and P. Sabatie. Richard Wegener was chosen Secretary and H. Huguet, Supt.

California State Telegraph Co.—Trustees: Geo. H. Mumford, James Gamble, Goo. S. Ladd, H. H. Haight, W. C. Ralstou, Chas. E. McLane and F. McCrellish. Subsequently G. H. Mumford was chosen President; H. H. Haight, Vice-President; Geo. S. Ladd, Treasurer and Secretary; aud James Gamble, General Supt.

Consolidated Virginia M. Co.—Trustees: Edward Barron (President); S. Heydenfeldt, J. C. Flood, William O'Brien, B. F. Sherwood; Secretary, D. T. Bagley; Superintendent James G. Fair.

Fine Metal From Base Ores.—The bar of gold and silver bullion of which we spoke in our last issue as extracted hy the Paul Process—simple amalgamation, from ores wherezinc, lead and arsenic were present, proved by Mint assay to be .989 fine, lacking only 11-1,000th of being chemically pure.

With 1872

Commencos volume XXIV of the Scientific Press. Its life of nearly 12 years, we verily believe, has saved more to the Pacific States, and imparted more profitable and practical knowledge to personal readers than any other journal in this new and still developing field. We wish to increase our usefulness. We want more subscribers added to our already large list. The publication of such a first-class paper is expensive. We shall make the Press worthy of double its present circulation this year.

Every old subscriber who can feel the value to himself and the community of a journal that seeks its patronage through articles instructive, elovating, and interesting, and without trash or sensatiou, we earnestly solicit to renew his own subscription and to speak a good word for the Press to others. The commencement of a new year and volume is a good time to

Send Us Your Subscriptions.

Jan. 1, 1872.

Old Land Marks.—We were shown this week an ancient map of North America, published in England in 1755, upon which we cannot find "our own country"—so to speak. The engraving and printing is finely executed; but the geographical outlines of coasts, lakes, rivers, etc., are terribly at fault with our latest surveys. We are reminded by looking over this map that our land was not at that date a "gridirou" of railways, though we have become so accustomed to them, that it seems strange how peoplo could ever have done without them. This map was found, with an old newspaper announcing the death of General Washiugton, aud a number of other antique publications, in a trunk left by his ancestors to J. H. Blethen, Jr., of this city.

Contributions to our Cabinet—No. 551.—Specimen from Ella Copper Mine, Railroad District, 28 miles south of Elko. Character of ore carbonates; mine worked by shaft 75 feet deep and tunnel 140 feet long; width of vein 21 feet at first level. Ore shipped to San Francisco and sold to manufacturers of blue stone. They have out now 200 tons of choice ore and will continue to ship as fast as means of transportation will admit; A. J. Roulstone, Supt.

Japanese Silkworm Eggs.—Hon. Frederick Watts, Commissiouer of the Agricultural Department at Washington, has been pleased, on the recommendation of Senator Cole, to forward to Secretary Johnston, of the California Cotton Growers and Manufacturers' Association, a lot of Japanese eggs. They are the *Bombyx Mori* variety. Amateurs and professional silk breeders can have some of these eggs, if timely application shall be made either to James Dale Johnston, 107 Sansome street, or to President Ellsworth, at the salesrooms of the California Silk Manufacturing Company, Market street, near Sansomo.

New Book on Mining, Assaying, Etc.—We have received a volume from the pen of J. S. Phillips, mining engineer, entitled "The Explorers', Miners' and Metallurgists' Companion;" Dewey & Co., San Francisco, publishers. It is a book of over 600 pages, and contains a practical exposition of the various departments of exploration, mining, engineering, assaying and metallurgy. It appears to be an excellent work, and must prove of great use.—*Daily Call, Dec. 13th.*

Sacramento.

[By T. M. Logan, M. D., Secretary State Board of Health.

Jan. 10, 1872. Rainfall for the season to date..15.457 inches
" 17, " " from Jan. 1 " " ...0.970 "

Total for the season up to Jan 10, 1872.....16.451 inchs.

Remarks.—The indications of approaching fair weather, pointed out in last week's report, are being fully realized; and a moderate northerly wind with a steady rise of the Barometer would lead to the conclusion of its continnance for a while. It will be observed in our published tables that prior to the 1st of Jan. we have rec'd 12.421 inches of rain. It is not probable, according to the theory broached in this paper last year, will be more than the amount subsequently to the 1st. of Jan., which would make the total for the season about 24 inches. On this I think we may safely calculate, as we have already received 16.421 inches, four inches of which has fallen this month.

Our Agents.

Our Friends can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

Wm. F. Spencer—California.
W. H. Murray—General Traveling Agent.
C. H. Dwinelle—Special Corresponding Agent.
I. N. Hoag—Sacramento, General Agent.
F. M. Shaw—San Diego.
L. P. McCarty—California.
M. B. Starr—Pacific Coast.
A. C. Knox, City Soliciting and Collecting Agent.

Our Printed Mail List.

Subscribers will notice that the figures found on the right of the pasted slips, represent the date to which they have paid. For instance, 21sp70 shows that our patron has paid his subscription up to the 21st of September, 1870; 4jy72, that he has paid to the 4th of January, 1872; 4jl73, to the 4th of July, 1873. The inverted letters (ɟɟɟ, etc.,) occasionally used are marks of reference, simply for the convenience of the publishers.

If errors in the names or accounts of subscribers occur at any time an early notice will secure their immediate correction. Please notify us if you are not properly credited within two weeks after paying.

A Good Binder for $1.50.

Subscribers for this journal can obtain our Patent Elastic Newspaper File Holder and Binder for $1.50—containing gilt title of the paper on the cover. It preserves the papers completely and in such shape that they may be quickly fastened and retained in hook form at the end of the volume, and the binder (which is very durable) used continuously for subsequent volumes. Sent postage free. It can be used for Harper's Weekly and other papers of similar size. If not entirely pleased, purchasers may return them within 30 days. Just the thing for libraries and reading rooms, and all who wish to file the Press. 1amhp

Mining Companies

Should advertise their Meetings, Assesements, and Sales, in the Scientific Press. Ratee more than one-half less than daily publications. Stockholders should take the hint and request their managers to truly economize by advertising in a Mining Journal, where all noticeemay be seen by cheaply purchasing and examining a weekly. You will thus save money and uphold a journal which upholds your interests.

COMPLETE VOLUMES

Of the Scientific Press can be had from January 1, 1864, to date, at $3 per single vol. or $6 a year. They afford the cheapest and best information on mining and the industry of this coast of any work published.

FOR 25 CENTS we will send, postpaid, four sample copies (recent numbers) of the Press. This, we believe, will induce many to subscribe who have not yet read our paper. It is a cheap and valuable favor to send a friend anywhere.

MARAVILLA COCOA.—No breakfast table is complete without this delicious beverage. The *Globe* says: "Various importers and manufacturers have attempted to attain a reputation for their prepared Cocoas, but we doubt whether any thorough success had been achieved until Messrs. Taylor Brothers discovered the extraordinary qualities of 'Maravilla' Cocoa. Adapting their perfect system of preparation to this finest of all species of the Theobroma, they have produced an article which supercedes every other Cocoa in the market. Entire solubility, a delicate aroma and a rare concentration of the purest elements of nutrition, distinguish the Maravilla Cocoa above all others. For homœopaths and invalids we could not recommend a more agreeable or valuable beverage." Sold in packets only by all Grocers, of whom also may be had Taylor Brothers, Original Homœopathic Cocoa and Soluble Chocolate Steam Mills—Brick Lane, London. Export Chicory Mills, Bruges, Belgium. fe25-1y

University of California.—The Preparatory Department is under the charge of five Professors of the University, and six tutors.

Besides the studies of the public schools, Algebra, Geometry, Latin, Greek, German, French, Spanish and Book-Keeping are taught.

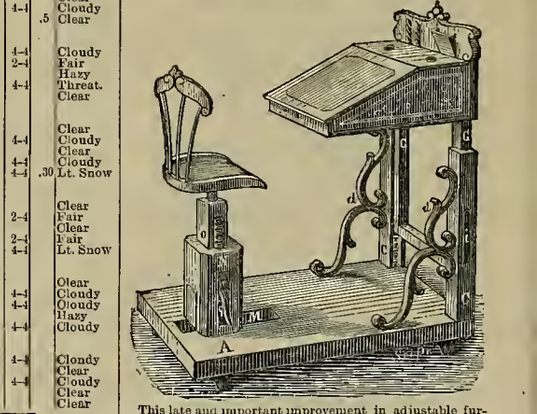
Terms: Board and tuition, 4 weeks, $30. Students received at any time. George Tait, Oakland, Master Fifth Class. 6e9hptf

$5 TO $20 PER DAY AND NO RISK.—Do you want a situation as salesman at or near home to introduce our new 7-strand White Wire Clothes lines, to last forever. Don't miss this chance. Sample Free. Address Hudson River Wire Works, 75 William street, N. Y., or 1 Dearborn street, Chicago, Ill. 23v1-12mhp

Ladies Desiring to Procure a First-Class Sewing Machine against easy monthly installments may apply to No. 294 Bowery, 157 E. 26th, 477 9th Ave., New York. Good work at high prices if desired. 21v1-12mbp

Continental Life Insurance Co., 302 Montgomery street, corner of Pine.

Watson's Patent School Desk.



This late and important improvement in adjustable furniture for schools, halls and other purpoeee, is now offered to the public on liberal terme. All its superior points of usefulness and merits can only be realized upon witnessing its actual operations. Address Wiley Watson, Visalia, Tulare Co., Cal., for further information. 2v24-26

BETTS'S CAPSULE PATENTS.

To prevent INFRINGEMENTS, NOTICE IS HEREBY GIVEN, that BETTS'S NAME is ON EVERY CAPSULE he makes for the principal merchants in England and France, thus enabling vendor, purchaser, and consumer, not only to identify the genuineness of the Capsule, but likewise the contents of the vessel to which it is applied. The Lord Chancellor, in his judgment, said that the Capsules are not used merely for the purpoee of the ornament, but that they are serviceable in protecting the wine from injury, and insuring its genuineness.

Manufactories:—1, Wharf Road, City Road, London, and Bordeaux, France.

Mining and Other Companies.

Owing to the time necessary to mail the present large edition of the Scientific Press we are obliged to go to press on Thursday evening—which is the very latest hour we can receive advertisements.

Alhambra Hill Mining Company—Location

of works, Alhambra Hill, Pluto District, White Pine county, Nevada.

Notice—There are delinquent upon the following described stock, on account of Assessment (No. 1) levied on the Ninth day of December, 1871, the several amounts set opposite the names of the respective shareholders as follows:

Names.	No of certificate.	No. shares.	Amount.
Amreas Fisher.....	not issued,	253	$126.50

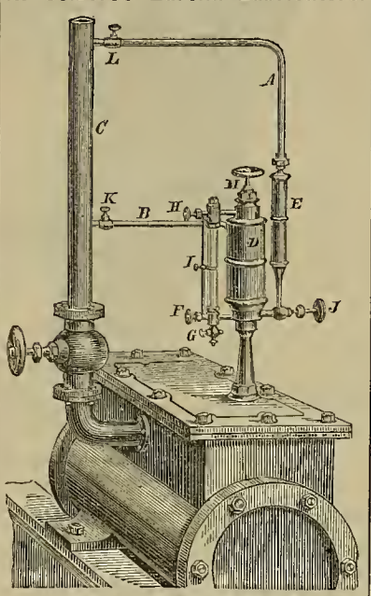
N. Seibert's Eureka Lubricators.



THE HIGHEST PREMIUM

Awarded by the Mechanics' Institute Fair, San Francisco, and State Fair, Sacramento, 1871.

These Lubricators are acknowledged by all engineers to be superior to any they have ever used; feed constantly by pressure of condensed water, supplied by pipe A, regulated under the oil by valve J, and forced out through check valve and pipe B into the steam pipe C; it then becomes greasy steam, passes to all the valves and cylinder at every stroke of the engine; glass tube I indicates amount used per hour. Packing on rods and stems lasts longer, and the rings on the piston will not corrode. One pint of oil will last from three to six days, according to speed and size of engine; I, sliding gauge; K, valve to shut off when engine stopps; H, F, valves to shut off in case of frost; steam does not enter the cup; it is always cool; warranted to give satisfaction. Patented February 14, 1871. Manufactured by California Brass Works, 125 First street, S. F. 24v23tf

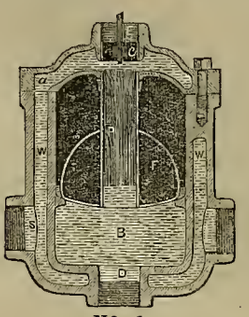
CRAIG & BREVOORT'S
Patent Condenser for Steam PUMPS, &c.



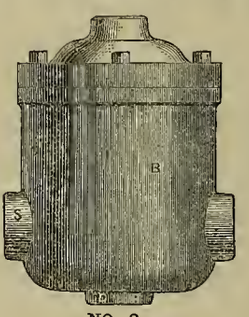
NO. 1.

The annexed engravings represent a Condenser intended to be attached to the ordinary steam pump, thereby bringing it within the class of low pressure, or more properly speaking, of condensing engines; the steam, when it has done its work in the cylinder, instead of being exhausted into the atmosphere, is conducted to the condenser, on its entry into which, it meets the water drawn by the pump, and is immediately condensed.

The Cut No. 1 represents a vertical section of the Condenser, and No. 2 an elevation.

The flange D is bolted to the suction orifice of the pump, and the flange S to the pipe leading to the well, or whatever source of supply the pump may have; W is a water jacket surrounding the main chamber of the condenser, B, and with which the suction pipe, S, communicates, permitting a free circulation of water within the jacket and into the hollow cover or top through the series of openings, one of which is shown at A, and from thence into the body of Condenser, B, through pipe P, carried by float F; the pipe P also acts automatically as a valve to enlarge or contract the space through which the water enters it, by which means the possibility of the condenser being at any time flooded is avoided. The pipe P, it will be observed, also acts as a guide to float F.

The valve, O, (shown in Cut No. 1), which is raised or lowered by means of screwed stem—shown coming through elbow in Cut No. 2—is for the purpose of increasing or decreasing the flow of water according to the capacity of the pump to which it is attached.



NO. 2.

The exhaust pipe from steam cylinder is screwed into cover at E; the exhaust steam is thus thrown directly into contact with the water entering the condenser on its way to water cylinder of pump through D. A vacuum being of course immediately formed, acts on the exhaust side of the steam piston, aiding it in its work. If at any time it is desirable to run the pump without the condenser, it is only necessary to turn the three-way cock, which is placed in the exhaust pipe, into such a position as to cause the steam cylinder to exhaust into the atmosphere; when this is done the pump is perfectly free from the condenser, and acts as if it were not attached. This condenser is specially useful for pumps running in mines, or any other position where trouble is experienced in getting rid of the exhaust steam. Address H. L. BREVOORT,

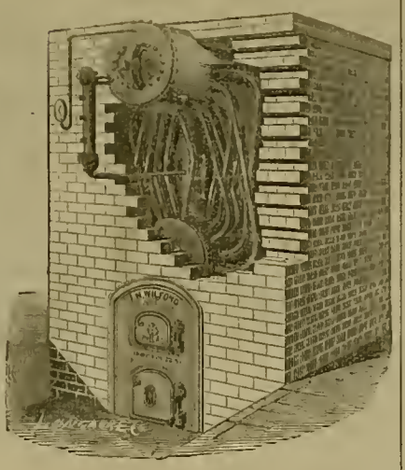
I. N. WILFONG'S
PATENT CIRCULATING
STEAM BOILER.



This cut represents an improvement on the old style of Cylinder Boiler, and combines all the following great advantages: Rapid circulation and generation of steam; economy in fuel; durability, safety, and simplicity of construction; requires but little attention; is easily repaired, and moderate at first cost.
We have now a number in successful operation, and respectfully refer to the following well known parties: Hastings & Co., Seventh and Cherry streets; Jos. Lea & Co., 128 Chestnut street; J. S. Huber, Germantown; Holt & Bro., Sixth and Susquehanna avenue; Albion Print Works, Conshohocken, Pa.; S. H. Dickey, Oxford, Pa.—all of which are giving ENTIRE SATISFACTION. Parties wishing to investigate the success of our new Boiler can do so by calling at any of the above named places, or to
I. N. WILFONG,

The Scientific Press,

Established in 1860, is now the Largest, Most Original, Best Illustrated and most Ably and Carefully Edited Practical Mining Journal on the Western Continent. Its contents are made up of fresh intelligence in a condensed and interesting style, easily appropriated by the reader, who finds its columns replete with new facts and ideas not obtainable in the books of the past or in any one other of the journals of the day.

Varied in its carefully compiled and conveniently arranged departments, representing the special and leading industries of the Pacific States—Mining, Mechanism, Manufacturing, Building, Improvements and Inventions—it becomes a weekly informant to all Scientific, Mechanical, Manufacturing and Industrial Progressionists on the coast, an immense list of whom testify to its pleasant, profitable and elevating influence.

The progress of our journal has been steady and unvarying. Encouraged by a liberal class of readers who exhibit their appreciation in a substantial way, we shall, with our increasing facilities, experience and information, make each coming issue superior to its predecessor.

Let every friend of Science and Industry on this side of the continent take pride, not only in sustaining, but accelerating the advancement of a faithful representative of its highest interests by subscribing for it and urging its patronage by others—now, without delay.

Subscription $4 a year, in advance. Address

To Inventors in the Pacific States.

The best, speediest, and surest method for you to obtain patents, file caveats, or transact any other important business with the Patent Office at Washington, or with foreign countries, is through the agency of DEWEY & CO., PUBLISHERS OF THE SCIENTIFIC PRESS, SAN FRANCISCO, an able, responsible, and long-established firm, and the principal agents on this side of the continent. They refer to the thousands of inventors who have patronized them, and to all prominent business men of the Pacific Coast, who are more or less familiar with their reputation as straightforward journalists and patent solicitors and counsellors.

We not only more readily apprehend the points and secure much more fully and quickly the patents for our home inventors, but with the influence of our carefully read and extensively circulated journals, we are enabled to illustrate the intrinsic merits of their patents, and secure a due reward to the inventor, besides serving the public who are more ready to give a fair trial, and adopt a good thing, upon the recommendation of honest and intelligent publishers.

To Obtain a Patent,

A well-constructed model is generally first needed, if the invention can well be thus illustrated. It must not exceed 12 inches in length or hight. When practicable, a smaller model is even more desirable. Paint or engrave the name of the article, and the name of the inventor, and his address upon it.

Send the model (by express or other reliable conveyance), plainly addressed, to "DEWEY & Co., SCIENTIFIC PRESS OFFICE, SAN FRANCISCO." At the same time, send a full description, embodying all the ideas and claims of the inventor respecting the improvement, describing the various parts and their operations.

Also send $15 currency, amount of first fee of the Government. The case will be placed on our regular file, the drawings executed, and the documents made up, and soon sent to the inventor for signing.

As soon as signed and returned to us with the fees then due us, it will be sent straightway to the Patent Office at Washington.

When the invention consists of a new article of manufacture, a medicine, or a new composition, samples of the separated ingredients, sufficient to make the experiment (unless they are of a common and well-known character), and also of the manufactured article itself, must be furnished, with full description of the entire preparation.

For Processes, frequently no model or drawings are necessary. In such case, the applicant has only to send us an exact description, and what is desirable to claim.

For designs no models are necessary. Duplicate drawings are required, and the specifications and other papers should be made up with care and accuracy. In some instances for design patents two photographs, with the negative, answer well instead of drawings.

We do not require the personal attendance of the inventor, unless the invention is one of great complication. Usually the business can be well done by correspondence.

For filing a caveat, which affords the inventor protection for one year, we only require a rough sketch, and a clear description of the invention.

It will cost inventors less to have their business thoroughly and speedily done through our agency than to patronize less able and responsible agents.

For further information, send a stamp for our illustrated circular, containing a digest of PATENT LAWS, 112 illustrated mechanical movements, and HINTS and INSTRUCTIONS regarding the RIGHTS and PRIVILEGES of inventors and patentees, which will be furnished post paid. Also a copy of NEW PATENT LAW of 1870.

BY DEWEY & CO., Patent Solicitors.

SAN FRANCISCO, SATURDAY, JANUARY 27, 1872.

VOLUME XXIV. Number 4.

The Line of Steamers for Carrying Ores to Europe.

The paragraph going the rounds of the press with the above caption, and which we published last week, avows the purpose of establishing a line of steamers for transporting ores containing the precious metals from the Pacific Slope to Swansea, for treatment. The simple proposition of establishing a line for such a purpose ought to arouse the capitalists of San Francisco from their lethargy in regard to the great, but neglected mineral resources by which they are surrounded. Whether the project will be accomplished or not, and, if accomplished, whether it will prove profitable or not, is not the question. The fact is patent that the mining eye of England is upon our mineral wealth—that in England they have better appreciation of that wealth than we have at home.

During the past two years English agents, familiar with the business of metallurgy, have visited our shores and discovered the immense mineral wealth which lies dormant from our want or knowledge how to realize. They are prepared to purchase our mines and our ores, and are doing both. Ores shipped to England may, and no doubt do, realize more for their owners than they would if worked upon the spot; yet none but the richest ores will warrant the cost of transportation. What is to become of the poor ores, of which we have an unlimited quantity? If we cannot treat the rich ores to advantage, we certainly cannot the poor. There is now more or less ore which goes to Europe, forwarded at low rates, because it is taken in return vessels as ballast, that would remain where it was, were it not for this advantage.

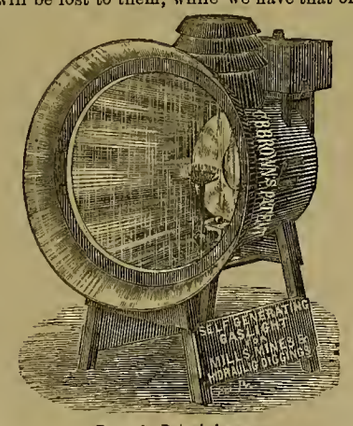
To forward ores from Utah, Montana and Nevada by rail to New York, and then run a special line of steamers to carry them to Europe, as proposed, would be an expensive business, and of course none but the richest could be sent. If there is trade enough to supply a line of steamers to Europe, there is surely capital enough at the different points west of New York to erect works to do the business, and skill enough to make it more profitable to work the ores here.

In practical metallurgy, the English are probably ahead of the world; while in the United States the business is as novel as was that of treating gold-bearing quartz twenty years ago, in California. Why is it that the capitalists of the States on the Pacific Slope, many of whom have made their fortunes from the mines, and who still continue in the business, do not secure the aid of English metallurgists of experience to instruct the thousands of young men in our midst who would gladly avail themselves of such facilities?

Is there not enterprise and public spirit among our millionaires to prompt them to advance the money necessary to secure the greatest want of our coast—metallurgical works upon a scale worthy of the object in view? Such works could be made self sustaining, if not profitable, after they were once under way, while they could be made to afford practical instruction to those having the intelligence to learn, and the willingness to labor.

The only works of importance in our midst are kept inviolate from the public eye, and although it is probable that the processes there used are nothing more than are common in English works of the same class, even the doubtful advantage of merely looking on is denied us. There must be a reason for this, which it is not to the advantage of the proprietors to be made known.

We suggest that immediate steps should be taken to ascertain whether a staff of practical English metallurgists cannot be secured, with the purpose of establishing such works on this coast as we have spoken of above, with the two-fold object—profit to promoters, and instruction for those who need it—a very large class. When this is done we shall have no need to even think of shipping ore, for the advantages the English possess in experience will be lost to them, while we have that of being near by the most extensive scope of mineral country in the world.



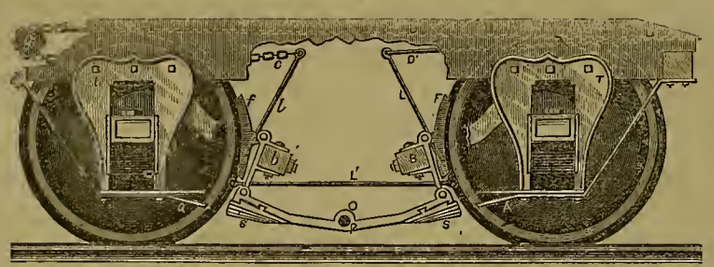
Brown's Patent Lamp.

All ores shipped to Europe must be first-class, and every one familiar with mining operations, knows that it takes a large number of tons, in the aggregate, to furnish one ton of sufficient value to pay for shipping to Europe. That we could support a line of steamers, however, no one doubts, our mineral fields are certainly broad enough, but our opinion is that outside of an exceptional lot, we should do the work on this side of the Rocky mountains. If this line is established we will have to close our mouths for evermore, and not boast of enterprise, skill in working ores, capital, etc. Either we are mistaken in the enterprise of our people or that line will have to look to some other branch of business for support.

Track Car Brakes.

We herewith give an illustration of a new track and wheel brake combined, that has been in operation for several months on the Philadelphia & Erie R. R., where it is said to have given general satisfaction. The men that work it every day state that they can stop a train in much less time and with greater ease than with any brake in use.

All the brakeman is required to do is to "put on the brakes" in the usual way. The moment the shoes *F*, *f*, come in contact with the wheels, their friction therewith tilts the oscillator, o, with the *rear* track shoe *s*, on the rail, retarding the train to an amount about double that applied by the man at the wheel. When backing, the friction motion changing, the oscillator is reversed and what was the forward end (now becomes the rear) is now put upon the rail, the same as above described.



PATENT TRACK CAR BRAKES.

It is so simple that it can be applied to any style of track, by using the same appliances for working (by hand or by steam) that are found on all cars; the chains, levers, wheel-shoes and brake-beams being the same as in the ordinary brake. The only difference being that instead of being suspended from the truck frame, the brake-beams are hinged to a bar oscillating at its center pin, *P*, said bar or oscillator having shoes, *s*, *s*, at each end flanged the same as the wheels, for friction on the track.

The brake is held to the truck by the bolt pin *P* passing through the frame bars, *A*, *a*, and into a corresponding bar on the inside of the track, holding the brake in its proper position, with the assistance of small springs for relieving it. It will be seen that the device is a combination of the forces of the wheel and track brake, and the power thus augmented will, it is claimed, stop a train in much less time than the methods now in use, and with less pressure against the wheel; in fact, it is desirable the wheel should have a lively motion as it imparts more frictional force to the track brake, which latter being in a dragging position has no rigidity, but holds back on a train upon the correct principles of a car brake.

The manufacturers guarantee all they claim, and will fit up a train complete on any road in California, without any detention to the cars, and, if they do not give satisfaction, ask no pay, and will restore their old brakes free of cost. M. W. Griswold & Co., 104 Chamber St., N. Y., are the manufacturers and patentees.

Brown's Mill, Mine, and Hydraulic Lamp.

Passers up Montgomery street last Monday evening were somewhat astonished at the sight of a new and peculiarly mounted light in front of our business office on Montgomery street. The light referred to is the one represented in the accompanying engraving, and is the invention of C. B. Brown, Esq., of Placerville, Cal. The object of the inventor in constructing this lamp was to render it available, more especially for lighting up the banks at night in our hydraulic mines, against which the miners are "piping;" but it can also be used in the tunnels and other parts of mines and in quartz mills.

The lamp or lantern as constructed is about two feet in diameter across its largest end, and somewhat resembles in shape the old-fashioned coal scuttle bonnets which our grandmothers used to wear. The lamp is mounted upon a low trestle or frame, and the whole can easily be moved about from place to place as required. The light used is produced by a gasoline burner on the inside of the lantern, which is fed with gasoline from the box or fountain seen above it at its rear end. Just back of the burner is a reflector, and the entire inside of the lantern is made of a bright reflecting material so as to employ the light produced to the very best advantage.

One of these lamps when placed at a distance of 200 feet from the bank, will light up a bank surface 250 feet in length and 100 feet in hight, and that to a much better advantage than any other light heretofore tried. The expense of maintaining the light will not exceed five cents per hour, thus saving to the miners two or three hundred dollars per year in this one item alone.

Mr. Brown holds letters patent covering the invention and is preparing to introduce the light in all of the mining districts in the State. For further particulars address C. B. Brown, Placerville, Cal.

MINING CORPORATIONS.—The Assembly, on the 23d inst., passed the bill in relation to mining corporations which we published in our issue of Jan. 13th, but it has been amended so that a majority of shareholders can call a meeting at any time and that two-thirds of the stock can oust the Trustees. Another amendment was added which provided that one-third of the shareholders may at any time compel the Trustees by vote, to render statements and exhibit the books of the company. It now goes to the Senate.

CORRESPONDENCE.

Eureka District, Nevada.

EDS. PRESS.—Although little writing has been done for this district, it having grown to its present importance as a mining locality through its gradual development by persevering prospectors, and nothing like the White Pine excitement has ever been awakened in regard to it, yet it may be confidently asserted that no other region has ever beeu explored on the Pacific slope, which has yielded so large a return for so small an outlay of capital and labor, as has the one named iu the caption of this article. Exteusive mining operations were not eommenced in Eureka until after the White Pine fever had subsided, and its disappointed victims had begun to seek in other localities the mineral wealth they had hoped to obtain there.

The First Discoveries

In Eureka, however, were made in 1865, and a mining district then organized; but it was not until the rush to White Pine had brought a great number of adventurers to this part of the State, that its merits as a field for successful mining began to be known. The few prospectors who entered the district in 1865 were discouraged hy the "base" eharacter of the ore at first encountered; and, while "chloride" was all the rage, and White Pine the center of operations, the extensive miuing ground of Eureka, only 38 miles to the northwest, lay almost wholly uuoccupied. The failure to realize profitahle returns from the base ores of White Piue caused a scattering of prospectors in all directions. Many went to Utah, others to Pioche, while a eonsiderable uumber turned their steps to Eureka. To these latter, and the few who remained from the first discoveries. is the present importance of the district due.

Smelting Operations.

Capital was soou attracted by the numher and richness of the mines, and in 1870 the first successful smelting operations were performed, with very inferior works. But these were supplanted hy more efficient ones, until now the furnaces of the Richmond Consolidated, Eureka Consolidated, Phœnix, Jackson, Buttercup, aud the Roslin works are capable of turning out immense quantities of metal from the ores of the district, which are of easy reductiou by the smelting process.

Eureka may challenge any other mining district to exhibit a mineral deposit of the extent and richness of

The Richmond Mine,

Ruby Hill. Although the property was sold to an English company for $750,000, the value of the ore in sight at the time greatly exceeded that amouut, and some of the trustees of the Americau company were even in favor of repudiating the act of their ageut in making the bargaiu for the sale of the mine. The sale was made, however, and the mine and reduction works transferred, at the figures named. Large as this amount is, negotiations have beeu peudiug for some time, for a second sale at the enormous price of $2,000,000. If this amount should be obtained, it will be the largest ever paid for a mine in the United States.

Prominent Mines.

The Buckeye and Champion mines, belonging to the Eureka Consolidated Compauy, of San Francisco, are also on Ruby Hill, and are nearly of equal value with the Richmond.

These, with the Empire, Lexington, Otho, and Jenny Lynch, belonging to the Phœnix Company, keep five furuaces in operation constantly; and the Richmond and Phœnix companies are hoth about to add two new furnaces to their reduction works.

The Buttercup and Roslin Works

Are at present idle; but the former, with the mines of the company, have been recently sold, uuder attachment, to George Hearst, of San Francisco, aud the Roslin furnace and mines are houded to a company proposing to purchase them for $250,000. The mines of the Roslin company include the Hamburg, Union, Fanuy B., and others.

Mining Tittes.

A large number of the mines of lesser uote have heen, and many still are under bond to various individuals and companies who propose to purchase them. Such are the General Lee, Wide West, Bullwhacker, Valeutine, Byron, Excelsior, Gaslight, and others. Many of the parties agreeing to purchase have since declined to do so unless they can derive title from the United States. This is especially the ease with English eompanies; and the reason assigned is the recent aunouncement of Commissioner Drummond, that only citizens of the United States can convey titles to mines. Other parties, American as well as English, now insist that a patent shall be obtained from the Governmeut by those iu possession, before a sale shall be concluded. This will therefore soon be done by the owners of all our really valuable mines.

Orange Mine and Lemon Mill.

The deepest mine in the district is the Orange, which is now heing worked at a depth of 300 feet, with ore valued at $200 aud $300 per ton. It is situated on Prospect Hill, upou which also are the Elise, Hamburg, Union, Lemon, and other valuable mines. The last uamed, belongs to the Lemon Mill and Mining Co., receutly incorporated in San Francisco, whose mill uear the town of Eureka is nearly completed and ready for work.

Mines on Prospect Mountain.

The highest hill in the district, kuown as Prospect Mountain, which lifts its Devouian cliffs to an elevatiou of 8,500 feet, is full of valuable miues, in a more or less forward state of development. One, called the Valentine, already meutioned, was lately honded at $25,000; hut the hond was allowed to fail. The mine has, however, since beeu taken at the figures uamed. The Golden Gate is another valuable property, in which large bodies of ore are encountered within 8 and 15 feet of the surface. It has a shaft down 80 feet, and a large quartz veiu, four feet in width, has just beeu uncovered at that depth. The ore assays from $65 up to $125 per ton. The X. Y.Z., belonging to the South Eureka mining company, of San Fraucisco, is on the same mountain, and is heing vigorously prospected. There is more ore in sight than can be moved from the mine, on account of the preseut depth of snow on the mountain. The "Fourth of July" is auother promising miue, owned hy four eitizens of Carson, and having a well-defined veiu of silver-bearing quartz, enveloped iu strata of argillaceous oxide of iron, white aud grey carbonates of lead, arseniate of lead, etc. The ledge aud orehearing strata are at present five to six feet in width.

The Diamond and Antelope mines are also well developed, and show large bodies of ore. The Diamond was discovered and opened by two returned Arizona miners, oue of whom is upwards of 70 years of age. He is still working upon another location near hy, while the drifts of snow upon the mouutain side are from three to five feet deep. His uame is Bridge; and he has a prospect of bridgiug over 25 years more of the present century with the remainder of an active and useful life. The Enterprise Nos. 1 and 2, are also valuable properties.

One peculiarity of all the

Ores of Eureka

Consists iu the large percentage of gold which they contain, and which, for lack of mills, has beeu suffered to run off in the slag of the furnaces, to a very wasteful degree. The construction and operation of the Lemon Mill, and of that at Pinto, 8 miles distant, will remove this difficulty in part; $80, and sometimes $100 in gold, is the yield from a ton of ore. The same ore will frequently work up to au essay of $150 and $200 in silver, and contaius but a comparatively small percentage of lead. By roasting out the latter, the ore is rendered extremely profitable for milling. The Piuto Mill has a roasting furnace attached, and the Lemon Co. contemplate erecting one also.

Milling and furnace ores exist together, or iu close proximity, in the same mines throughout Eureka district. In this particular the miueral development is wholly different from White Piue. In the latter district the base ores have a range of hill to themselves, while chloride silver is mostly confined to Treasure Hill. Furthermore, the gangue is also different. For while both free aud base ores in White Pine seem to he always indicated and invested by calc-spar, with a very small showing of quartzite, in the minee of Eureka there is a notable absence of the spar, and a corresponding increase in the size, and a uniformity in the course of the veins of quartz. In fact, the quartz is the silver-bearing rock of the district, although the investing eoatings or strata of haser ore, consisting of arseniates and carbonates of lead, with occasioual accretions of galena; and the oxides of iron also contain both silver and gold in paying qauntities.

Geology of the District.

The mountain ranges of Easteru Nevada, south of the Humholdt river, trend due south. But those portions of eaeh range, iu which aro situated valuahle mineral belts, are posited in a different manner. At least, this is the case with White Pine and Eureka Districts. For the hills comprised in these two ore-belts, lying respectively in the Ruhy and Diamond ranges, form an acute angle with those ranges, with a course or bearing northwest and southeast. And the veins of ore-bearing rock, with their accompanying strata, have a strike corresponding to the same direction. It would appear from this, that these mineral belts are of a later date in their formation and upheaval than other portions of the ranges in which they lie. They seem like immense dikes, intruded into and dividing these ranges into several parts.

The entire leugth and breadth of the Eureka belt is an enormous network of quartz veins, imbedded in strata of earthy and base minerals, the whole inclosed in limestone and calcareous shale. Wherever au opening has heen made, upon indicatious of ore, either in the shale or limestone, aud the exploratiou contiuued to a suitable deplh, quartz has been invariably uncovered. The veius dip in all directions, according to their situation and with every possihle slope to the horizon. But their course is always northwest and southeast. The depth, length, and hreadth of the strata, bearing the earthy ores surrounding the veins, vary in the diffesut openings. In the Richmond, Buckeye, Champion, Tip-top' Marcellina and othors upon Ruby Hill, they appear in immense deposits or fields, hundreds of feet iu extent, and thousands of tous have becn extracted therefrom, and reduced to the metallic state by smslting. As mauy tons of the silver-bearing quartz remain to be reduced by the mills. In the General Lee, Lexiugton, Empire, Wide West, Newport, Meredith and others upon Empire and Adams Hills, the quartz is mostly in limestone, the shale heing very limited in extent. These veins are composed of milling rock, and the earthy strata are small. Iu the Bullwhacker serics, with whieh this oxtraordinary mineral helt terminates on tho uorthwest, the Otho, the Jeuny Lynch, and the Bullwhacker, are in an immense bed of shale, and yield large quautities of galena as well as a great deal of the earthy orcs. Yet these last named mines are a little more than a mile distant from Empiré aud Adams Hills, just mentioned.

At the southeastern end, eomprising Prospect Mountain—Ruby Hill being situated in the eenter of the district—the quartz aud earthy ores are found together in beds of shale which alternate with cliffs of limestone. The shale is sometimes comminuted aud cemented together very compactly by the oxides aud a little clayey matter. Boulders of limestone are also iutermixed. The presence of ore is indicated by floating pieces of quartz, accompauied by the peroxide and protoxide of iron; also by the dissemination in the surface soil of the arseniate of lead, which is of a brilliant straw or lemon yellow color. There is also some galena found in the limestone, as well as antimonial sulphuret of silver. But these ores are more plentiful on the southeastern and southweetern end of Prospect Mountaiu, comprised in Secret Cañon and Spring Valley Districts. Free ore is also abundant in Secret Cañon, with only just enough base metal to need a chloridizing roasting. This may he obtained at the Pinto Mill, near by.

The numerous quartz veins and the ahundancs and variety of the ores of Eureka and neighhoring districts, show that the country rock is an older formation than the dolomite of White Pine. It is truely a cavern limestone; for immense caves have been fouud in the Orango and other mines, the floors of which were covered to a great depth with earthy ores, rich in silver. Oue was barely entered, not explored; for it seemed to have no limit as to sides, top, or bottom. We shall know more of it by-and-hy, as explorations proceed.

Yield of Ores.

The results of mill and furnace work show that the ores of all descriptions found in Eureka will yield from $40 in silver up to $500 per tou; and from $10 to $80 aud even $100 in gold. A lot of ore from the Silver Lick miue, having been previously carefully assayed by sampling, and found to contain at the rate of $80 per ton in gold, was sent to the Manhattan mill, at Austin, to be reduced; but the mill made only return of the silver obtained from the ore, and ignored the gold altogether. How much the ore of the Comstock lode will yield even $80 in silver? Yet the mills on that lode will work ore at a profit when it eontains only $8 per ton. The infereuce against the return above given is obvious enongh. Miners will not continue to send their oro to custom mills to be reduced at such ruinous rates.

Climate, Etc.

The climate of Eureka is not so severe in winter as that of White Pine. Only the high hills and uorthcrly exposed points are subject to deep snows. The town itself, which is 2,000 feet lower than Treasure City, is at this time entirely free from snow. It lies iu a cañon among low foothills, a short distance east of Diamond valley, which is a broad plain of 20 miles or more in width. Heavy rains have thoroughly soaked the plain, so that the roads across it are very difficult to travel at this time. Freighting from Palisade is eonsequently very costly. All this is changed in the summer season, and the ensuing summer will be a brisk season for Eureka District.

M.

Mines Near Radersburg, M. T.

EDS. PRESS:—The Left Hand lode is a true fissure vein, with a crevice averaging about 20 inches in width. It crosses the line of stratificatiou at right angles, dips 70 degrees to the south, runs due east and west, and crosses the Keating lode at right angles at a point about 250 feet from its discovery shaft, at a depth of 60 feet.

The Left Hand lodo is developed to a depth of 150 ft., at which point it showe a 2-ft. crevice. Levels are being run east and west from this point. The upper portion of the lode for 200 feet by 50 feet deep, has been stoped out and crushed, the ore returuing about $35 per ton.

The Keating Lode

Rune north aud south with tho lines of stratification; it pitches about 70 degrees to the west. Keating & Blacker are ruuning about 70 men, having levels run and have out about 300 tous of rock and are now increasing their working force.

Mr. Allen has put on a new force on the

Allen Lode.

His six-stamp mill, the only one runuiug in camp, is crushiug at the rate of 80 tons per week. Out of his thousand ton dump, the quartz averages about $15 per ton. The Davis mill now being thoroughly overhauled, will soon commence crushing this quartz.

Other Mines.

The Rica, Hidden Treasure, and a seore of other mines are being devcloped this winter; they all show free gold and look promisiug. The Jaw-hone lode near St. Louis, on Indian Creek, has just made a run of fifty tons of ore; it yielded ahout $25 per ton, and was crushed at the Diamond Mill. A large mill will be put up here this coming spring by the Clancy Co., and a company is being formed upon consolidated interests on the Iron Clad lode, which we understand will put up a mill, and steam hoisting works on their lode.

The new impetus in quartz-mining taken in connection with the certainty of an abundance of water, on account of the unprecedented fall of snow, promises that the coming season will be one of great prosperity in this and adjoining camps.

W. C.

HOW TO SELECT PEOAN NUTS FOR PLANTING.—The Memphis *Farmer*, in recommending the pecan tree for cultivation says: Select best Texan pecans, largest and thinnest shells, and plant in December, January, or February. By trausplanting carefully every two years (cut off tap root first year), for two or three times, they will fruit in eight or ten years, and when 15 years old will bear a bushel each; when fully matured, one or two barrels of the best, worth generally $20 to $30 per harrel. Plant, say 30 feet apart, aud leave to your children a snng income.

BISMUTH IN SAXONY.—It appears that that country produces 32,000 lbs. of the metal annually, and that, since hismuth is as yet nowhere produced in any considerable quantity, Saxouy rules the market of this article.

MECHANICAL PROGRESS.

Titanic Iron and Steel.

Considerable attention was drawn, three or four years since, to the manufacture of a very superior iron made from an admixture of titanic iron ore, with other more common ores of iron. Numerous experiments were made in this direction in the production of the mixed iron as above, of iron from the titanic ore exclusively, and of a steel, the latter more generally known as "Mushet's Special Steel." Extensive works were put up in England for the manufacture of these superior qualities of iron and steel, but the difficulties encountered in the reduction of the titanic ores (or sands as they generally occur) seem for a while to have operated as an effectual discouragment to the expenditure of money for this purpose by capitalists.

We have lately, however, seen some evidences of a renewal of efforts in this direction, by a new company, located at Sheffield. This movement, according to *Engineering*, appears to have resulted from the successful persistency with which Mr. Mushet has advocated the use of titanium in the production of high class iron and steel. The extraordinary strength and toughness of Mr. Mushet's titanic steel as shown by Dr. Fairbairn's experiments, was the subject of remark in these columns at the time of those experiments being made public. "More recently" says the journal above named, "we gave from personal observation some particulars of the remarkable properties of Mr. Mushet's new non-hardening special steel. Now that the manufacture of these steels has passed into the hands of Messrs. Samuel Osborn and Co., they will doubtless be still more extensively used. When speaking some time ago of the non-hardening special steel, we directed attention to its endurance when used for tools in machines driven at higher speeds than usual, and, at the present time, when with the shorter hours of labor it has become more than ever an object with engineers to get as much work out of their lathes and planing machines as they can in the shortest space of time, this point is worthy of notice."

In view of the growing importance which must soon attach to this description of iron ores by means of its peculiar adaptability to the manufacture of steel, and its almost entire freedom from sulphur and phosphorus, it may be interesting to know, that while English ironmasters are thus far almost entirely dependent upon the distant island of New Zealand for their supply, they occur abundantly in the United States.

The principal deposits of titaniferous iron ores in this country are in Northern New York, Missouri, Tennessee, North Carolina, Virginia, and Maryland.

The deposits in the northwestern part of North Carolina, owned or controlled by a Philadelphia company, have been found by a recent survey to extend in almost a continuous line for over 300 miles. The deposits, which affects the form of a nearly vertical vein, has a thickness of from 4 to 10 ft. The per cent. of titanic acid varies, but is about 10 on an average. The supply of ore may be considered as inexhaustible, and charcoal is abundant everywhere. Bituminous coal-fields will be soon reached by projected railroads.

Titanic iron ore in the form of sand is found on the ocean beach to the westward of this city (San Francisco), and a company was organized some few years since to take up and work this deposit.

THE IRON INTEREST OF THE UNITED STATES—EFFECT OF FREE TRADE UPON IT. Klucpfel, a German writer of much distinction, and well versed in the iron trade, has written a carefully considered series of articles for a German periodical, in which the conclusions arrived at are, that if the present tariff were done away with and free trade substituted; 1st, the production of cheap pig metal of inferior quality would be impossible east of the Alleghanies, owing to the lack of cheap ores and the cheapness with which the metal could be obtained from England. Besides, the production of malleable iron would only be possible to a slight extent, owing to the cost of coal. On the other hand, the production of a large amount of foundry iron, as well as forge pig, might be possible. The foundry iron could be used in the vicinity of the the works, while the forge pig could be sold to the Pittsburg, etc., rolling mills. 2d, it would be impossible to produce considerable amounts of pig metal in Western Pennsylvania, owing to the lack of ore. On the other hand the production of wrought iron and cast steel from pig metal imported from other places could be done on a large scale. 3d. The same conditions would be true for Northern Ohio as for Western Pennsylvania, while it is probable that a small district exists in Southern Ohio where blast furnaces and rolling mills could be profitably worked. 4th. The production of all kinds of pig metal could be carried on profitably in Michigan, Wisconsin, and the other States bordering on the Great Lakes. 5th. The same is true of Eastern Missouri.

Fire-Proof Buildings.

The Providence *Journal* publishes the following extract of a letter from the Sculptor Powers to a friend in Rhode Island. It furnishes some valuable and timely hints with regard to the construction of fire-proof buildings:—

But it may be asked, "Is it possible to make a city fire-proof?" I answer, yes, and without any great extra expense. To prove this, I have only to say that although there have been frequent fires in the city of Florence during the thirty-four years of my residence in it, not one house has been consumed, except a theatre, and that was not entirely destroyed. Rooms, full of goods, have been heated like ovens by ignited calicoes, straw hats, etc., but as the floors above and below were all covered by thin brick tiles, the goods burned without ventilation. And as there was no flame, a smell like that of a coal pit soon gave the alarm, and the fire was soon extinguished by no other engine than a squirt holding about a gallon, which discharged a well-directed stream through some aperture. I once beheld some firemen marching to a fire in Florence. First were three men with picks, next four men with buckets, then three men with highly polished brass squirts on their shoulders; all marching with an air of pomp and importance! The fire was at the residence of Mr. Clevenger, the American sculptor, and had been burning 24 hours on the end of a joist just under his fire-place. He had smelt something like a coal-pit for some time, and at length perceived smoke rising from the brick floor. On going below he found the room full of smoke, and a rush-bottomed chair just under the joist was partially consumed. But the joist was not yet burned off, and why? Because the fire was bricked down. It could not rise and burst into flames.

The secret of fire-proof building, then, is this: It must be made impossible for the flames to pass through the floors or up the stairway. If you will have wood floors and stairs, lay a flooring of the thickest sheet-iron over the joists, and your wood upon that; and sheath the stairs with the same material. A floor will not burn without a supply of air under it. Throw a dry board upon a perfectly flat pavement and kindle it as it lies if you can. You may make a fire upon it and in time consume it, but it will require a long time. Prevent drafts, and though there will still be fires, no houses will be consumed. The combustion will go on so slowly that discovery is certain in time to prevent any great calamity. But the roofs, how about them? Slate or tiles? Zinc melts too easily. I believe that hard-burned tiles, if flat, would stand the frost at home; and if so, they constitute the best roofing. My house has no joists. All the floors are of tiles resting on arches. One of these arches was made over a room twenty-five feet square, by four men in four days. The brick are about one and one-half inches thick, and laid edgewise, with plaster of Paris. There was no framework prepared to lay them on unless you would so term four bits of wood which a man could carry under his arm. And yet this arch is so strong as to be perfectly safe with a large dancing party on it. I never have heard of one of those floors falling, and they are absolutely fire-proof. Of course light arches like these would not do for warehouses. It would pay, I think, to send out here for an Italian brick-mason who knows how to build these thin but strong arches for dwelling houses. I know that there is a prejudice at home against brick or composition floors. "Too cold in winter," it is said. And so they are, if bare, but cover them with several thicknesses of paper and then carpet them, and no one can discover the slighest difference between their temperature and that of wood floors. Who doubts this let him try the experiment with the feet of the thermometer. The truth is that the brick of composition floor is no colder in itself than the wood—the thermometer attests this—but it is a better conductor. I do not insure my house, as I know that it is not combustible.

SCIENTIFIC PROGRESS.

A Substitute for the Spectroscope.

E. Lommel has devised three very simple instruments called the *erythophytoscope*, the *erythroscope*, and the *melanoscope*, which can be advantageously used, instead of the spectroscope, for the detection of substances by their colors and colored flames. Two colored plates of cobalt blue and dark yellow oxide of iron glass are laid upon each other, and, by inserting them in black pasteboard, with a slit for the nose, something like a pair of spectacles is made of them. The combined glasses are only transparent for the ultra red, for yellow green, for blue green and blue rays; and they cut off all other colors. Substances, known to possess these colors or to impart them to the flame of a spirit lamp or Bunsen burner, can be detected by viewing them through such spectacles. The *erythroscope* consists of a cobalt glass and ruby glass, which only admits the ultra red, beyond Fraunhofer's line B, to pass. The third combination, called the *melansocope*, consists of a dark red and clear violet glass which only allows the middle red tints to pass. Anyone who possesses the facility of alternately using the right and left eye, could employ two combinations at once and thus cover nearly the whole length of the spectrum. For the use of students in laboatories, we should think that the simple arrangement described above could be frequently employed to advantage for the detection and separation of a large class of bodies which give characteristic colors to flames; and, by practice, the learner would soon be able to assign the true position to each color nearly as well as if he used the scale usually attached to the spectroscope.

Olive Oil as a Purifier of Carbonic Acid.

In the manufacture of carbonic acid for mineral waters and soda fountains, in consequence of impurities in the limestone employed for the evolution of gas, certain disagreeable empyreumatic oils and offensively tasting gases are apt to go over; and, unless separated in some way, they will impart an unpleasant flavor to the mineral water. To obviate this difficulty, E. Pfeiffer suggests saturating pumice stone with olive oil, and passing the gases through it in the usual way. The oil absorbs the bad gases, and can be regenerated for subsequent use by heating it to expel the absorbed impurities. After becoming quite impure, it is still suitable for the manufacture of blacking or for applicaton as a lubricator. It is said that Mallett employed this method to absorb the hydrocarbon products in his process of obtaining ammonia directly from coal tar. As much of our limestone contains organic matter, which gives a peculiar smell to carbonic acid made from it, this method of purifying the gas by passing it through olive oil is worthy of trial.

TO DEODORIZE KEROSENE OIL.—The odor of a substance is in most cases adherent, like color or any other physical property, and not accidental or extraneous. Where, as in the case of kerosene oil or the lighter petroleum naphthas, the substance is a mixture of many constituents, it is difficult to decide which of them is the objectionable one, and so long as this has not been determined, we can devise no rules for getting rid of it, or for destroying it in any other way. Practically, therefore, we are unable to deodorize the products, and especially the lighter ones of the distillation of petroleum; but we may conceal them in the same way as formerly the disagreeable odors incidental to sick rooms and even to ordinary apartments were hidden by the liberal use of strong smelling liquids or the fumes of incense. The best adapted fluid for this purpose is, perhaps, the artificial oil of bitter almonds or mirbane oil; a little of it will go a great way in disguising the odor of petroleum effectually, and as it has a very high boiling point, it will accomplish its purpose most durably.—*Druggist's Circular.*

SEPARATING FIBRES.—In a recent number of the *Moniteur Scientifique* a paper was contributed by Dr. E. Kopp, on the "Means of Detecting and Separating Silk, Wool, and Vegetable Fibres from each other" by hydrochloric acid. The practical bearing of this discovery was exemplified by the immersion of several so-called pure silk ribbons and other fabrics in the acid, when the silk was dissolved, leaving the adulterated material intact. Somewhat similar experiments were made last year by Mr. John Spiller.

Recent Progress in Chemistry.

I wonder what Sir Humphrey Davy would have said to any one who talked about stellar chemistry. That great man, in ridiculing the idea of lighting London with gas, triumphantly asked the fanatics who proposed such a wild scheme, whether the dome of St. Paul's was to be the gasometer? Yet we cannot imagine Regent street illuminated, or rather darkened, with dips again, and to us stellar chemistry has a real meaning. Who will venture to bound a science which reaches far away through space, and with unerring accuracy tells us the composition of distant worlds and distant suns? What can be more humiliating to our small intelligences than the reflection that a distant star will photograph its spectrum on a sensitive surface with the ray of light that left it when the oldest man in this room was a boy? What would the great father of British chemisty have said, had he stood in the lecture room of the Royal Institution, where his great discoveries were made, and seen the burning hydrogen extracted by our great countryman Graham, from a meteorite, the heat and light of another world; or could he look with Leckyer on the burning flames of hydrogen, which dart up from the sun to a hight of 50,000 miles, or could he read the flashing telegrams which run so rapidly round our world, that all our notions of time are completely upset, and we actually receive intelligence to-day which was sent to-morrow? Excuse the apparent absurdity; it only shows how powerless language is to keep up with human progress. Had he lived with us, he would have seen a large city dependent entirely for its communication with the outer world by a marvellous kind of photography, so minute that it enabled a pigeon to carry a proof sheet of the *Times* under its wing.—*E. C. C. Stanford.*

DETERMINATION OF SULPHUR AND PHOSPHORUS IN IRON.—The presence of the least trace of phosphorus and sulphur in iron will destroy it for many purposes, and a correct and easy way of detecting these substances is therefore of importance. K. Meineke dissolves the finely pulverized iron in chloride of copper, separates the reduced copper by treatment with an excess of chloride of copper and common salt, filters through a layer of asbestos, brings the insoluble portion adher ing to the asbestos into a breaker glass and oxidizes hy strong nitric acid and chlorate of potash; then he evaporates with hydrochloric acid and determines the sulphur by baryta, as sulphate, and the phosphorus by molybdic acid in the usual way. The novelty of this method is in the substitution of chloride of copper for the chloride of iron employed by other chemists, and its advantages are said to be in the greater facility with which the various liquids and solutions can be filtered. It also yields more accurate results than the former methods.

A NEW LIQUID FIRE.—Guyot says that when bromine and flowers of sulphur in excess are mixed together in a close vessel, and filtered through asbestos, a reddish, oily fuming liquid, hyposulphurous bromide, SBr_2, is obtained. When treated with ammonia, it soon begins to boil violently, evolving copious white thick fumes. The same action takes place when the bromide is mixed with carbon disulphide, but the heat evolved is not sufficient to inflame the CS_2, unless a fragment of phosphorous be previously dissolved in it. A liquid made of this mixture, and containing phosphorus, the author proposes to call "the new Lorraine fire." Rectified petroleum may be substituted for the disulphide.

MAGNETISM.—A. Casin, after describing a new method of measuring magnetism, (the method not given in the journal before us), gives the following law for the magnetism of electro-magnets: "When the core of iron fills exactly the coil of an electro magnet, the quantity of magnetism is independent of those parts of the core which are beyond this coil."

A NEW PROCESS.—*Comtes Rendus* contains a posthumous paper by E. L. Rivot, for a new process for treating gold and silver ores, the main feature of which consists in causing the steam to act at a high temperature on the mineral sulphides.

CLEANING GLASS VESSELS, which have contained petroleum, may be effected by milk of lime, which forms an emulsion with petroleum, and by chloride of lime, which destroys the smell.

MINING SUMMARY.

THE following information is condensed mostly from journals published in the interior, in close proximity to the mines mentioned.

California.

ALPINE COUNTY.

ACACIA.—Alpine *Chronicle*, Jan. 13: The Exchequer Co. are running on with the old Acacia tunnel, to strike the 140-ft. level of the Exchequer mine. This will drain the mine and enable the Co. to run out their ore more expeditiously.

MONITOR MILL.—Monitor *Miner*, Jan. 13: This mill will be ready and go to crushing quartz on Monday next.

AMADOR COUNTY.

DRYTOWN.—Amador *Ledger*, Jan. 20: The new discovery made by D. Worley, looks remarkably well and gives flattering evidence of future value. Other strikes have been made in the vicinity that bid fair to prove valuable and lasting.

Preparations are being made to resume work on a number of quartz lodes in the neighborhood.

BUTTE COUNTY.

GOLDEN BAR.—Butte *Record*, Jan 13: On the 10th inst. the Supt. of the Spring Valley M. Co., of Cherokee, brought down a bar of bullion weighing $8,600.

THE Miners are all busy at Cherokee, the storms having supplied every ravine with a sluice head of water.

CALAVERAS COUNTY.

DISCOVERY.—Calaveras *Chronicle*, Jan. 20: On Saturday of last week F. Barney, of Mosquito Gulch discovered a very promising quartz ledge near that town. The lead shows over 3 ft. wide on the surface and the rock prospects handsomely. Work is to be commenced immediately.

PETTICOAT.—Exceedingly rich rock has recently been struck in the Petticoat mine at Railroad Flat. The sinking of the shaft to a depth of 350 ft. was completed sometime since and a level commenced. A large, well defined lead was developed, but the rock contained no gold. One day this week, the explosion of a blast disclosed quartz in which free gold is plainly visible.

ZACATARA MINE.—Work will shortly be resumed upon the Zacatara mine near West Point, idle for 2 years.

GOOD HOPE.—A level has been run 30 ft. on the pay chimney without getting through it. The ledge is 3¼ ft. wide and all the rock contains gold. Ashbury & Smith, have made arrangements to have 100 tons of quartz crushed in the old Vance mill.

GRAVEL MINING.—At the What Cheer mine, work is being pushed forward vigorously with satisfactory results. The incline, with its connecting level, is about 700 ft. in length, in addition to which a number of "drifts" have been run across the channel at various points. The gravel looks well and prospects good.

In Shaw's great hydraulic claim operations have not been commenced in earnest yet, but quite a number of hands are engaged ground sluicing. Next Monday water will be turned on through the pipe.

Brackett & Co. are taking out gravel of unprecedented richness. The yield of the mine for the past 2 weeks was $1,000—a net profit of over $600. The claim is worked through a tunnel, the gravel obtained being crushed in a 5-stamp battery. Fifteen men are constantly employed and work is pushed ahead with vigor. A little further up the gulch we encountered the tunnel claim of Bates & Co. These gentlemen have been "off the lead" for some time past and suffered considerable inconvenience from water; recently, however, they have succeeded in getting rid of their aqueous difficulties, "struck it" again and are taking out pay gravel.

In Corral Flat Champion & Co. have commenced bailing out the water that drove them from their "diggings" a short time since.

At Sport Hill, Moser & Co.'s hydraulic is in full blast and doing good execution.

In the same locality Johnson & Co. are busily engaged in their tunnel claim and getting fair returns.

GWIN MINE.—The water is being taken out from the shaft in the lower mine and it is expected that the "Alexander" battery will be put in motion next week.

INYO COUNTY.

NEW BLOWER.—Inyo *Independent*, Jan. 13: The Swansea furnace has just been fitted with a new fan or blower, of increased size and power.

NEW TUNNEL.—The Wittekind boys have started in a new tunnel, to tap a large body of exceedingly rich ore, which has been opened below their present working level. It will intersect the ledge about 120 ft. in depth and be 200 ft. long.

THIRTY STAMPS.—The Eclipse new mill is being run with a full battery of 30 stamps, with very favorable results.

MONO COUNTY.

RICH ORE.—Reno *State Journal*, Jan. 20: The Auburn mill has worked 22 tons of ore for A. Mack, taken from one of his mines in Hot Spring dist. which yielded $700 per ton.

NEVADA COUNTY.

LOCATIONS.—Nevada *Transcript*, Jan. 20: Grannan and others have located 800 ft. of Daisy Hill ravine, in Grass Valley dist., from Sebastopol Gulch up the ravine to the road. C. E. Olney and others have located 2,100 ft. on a quartz ledge, near Frenchman's Bar, on the South Yuba river in Nevada township.

RICH STRIKE.—On Wood's Ravine Philips & Molar found several quartz specimens, and among them a piece worth $97, and another worth $100. J. Schmidt struck a pocket in his father's ranch on the ravine, from which he has taken out $600.

BIRCHVILLE. — At Birchville the Red Rock Tunnel Co. are at work. This Co. is running 500 inches of water and will clean up in a week or so.

HUNT'S HILL.—Every Co. is at work in the vicinity of Hunt's Hill and every man is employed.

FRENCH CORRAL.—All the Co.'s at Kate Hays Flat and French Corral have started up and have plenty of water and good prospects.

COMMENCED WORK.—We hear of a general activity among miners throughout the Co. In nearly every camp the word is, all our Co.'s are running, with plenty of water and good prospects.

BLUE TENT.—Three Co.'s are at work at Blue Tent, running a large amount of water, and having a splendid prospect.

SAN JUAN HILL.—Co.'s are at work on San Juan hill, just beyond the limits of the town of San Juan. Davis & Boun and Davis & Co. have been washing some time; and Denniker & Co. are fitting up for work at the lower end of the hill. They are building a flume and will be ready to commence work in a week.

QUAKER HILL.—All the claims at Quaker Hill are in splendid running order and more men employed than ever before. Jacobs & Sargent have in operation 4 of the largest size monitors which are washwashing off the ground at a very rapid rate.

SCOTT'S FLAT.—Ashburn & Baker, in whose claims an extensive cave occured 2 years ago, filling up their diggings, are now putting up a new flume to avoid slides hereafter. They are engaged in building a ditch to bring water out of Central Cañon.

Thos. Holmee, whose operations were stopped a short time since by a slide in his claims, has started up in a new place. He has rich ground and big pay..

AT WORK.—Gentry & Co. on Oustomah Hill, have commenced washing in their claim. They have abundance of water and a prospect for a splendid season.

THE MANZANITA CLAIMS.—These claims are being run to their full capacity and employment is given to about 20 men.

RICH ROCK.—Grass Valley *Republican*, Jan. 21: We saw two pieces of rock from the Seven-Thirty mine yesterday. One piece weighing 15 ounces, was estimated to be worth $100. Thirteen tons of rock from their incline crushed at the Gold Hill Mill, yielded $504.

NEVADA QUARTZ LEDGE.—The incline on the Nevada quartz ledge at Sogg's mill is down 100 ft., and the rock is good—growing better as they progress downward. The incline is down 74 ft. below the bed of Deer creek.

NEW YORK HILL MINE. — We notice some fine specimens of rock from the New York Hill mine at the bank of A. Delano. The rock is from the fourth level of the mine, where they have a splendid ledge from 18 inches to three ft. wide.

NORTH STAR.—Grass Valley *Union*, Jan. 21: This mine is doing well. The skimmings from the batteries from the 6th of Jan. to the 18th, yielded $7,100.

IDAHO.—The run of the Idaho mine and mill for the last week was a good one. In the six working days, with 15 stamps, gold to the value of $10,000 was taken out.

PLACER COUNTY.

DISCOVERY.—Placer *Herald*, Jan. 20: We have been shown some talcose and quartz rock taken from a new and unexplored vein not far from here, which shows sulphurete and free gold in plenty. The ledge is about 18 inches wide.

ECLIPSE.—This mine is east of the St. Patrick and south of the Greene, about two miles west of here, and is generally known as the Patterson. The main shaft is down 75 ft., and 60 ft. from the surfaces a level is being run, from which over 50 tons of rock have been taken, showing finely in free gold. This rock will mill from $30 to $40 per ton.

GOLD YIELD.—Auburn *Stars and Stripes*, Jan. 18: A few days ago there was a crushing at Pugh's mill, of quartz from the ledge of W. H. Puffer & Bro., on the south side of Auburn ravine, a short distance below Newcastle. The yield from 50 tons of rock, just as it came from the ledge, was 126 ounces of retorted gold, valued at $15 per ounce.

PLUMAS COUNTY.

NICE "SLUGS."—Plumas *Herald*, Jan. 13: D. Bushman, at work near the head of Blackhawk, one day last week, picked up a piece weighing about six ounces, and another worth about $17.

SAN BERNARDINO COUNTY.

TIN MINE.—Butte Co. *Record*, Jan. 13: N. W. Clark, formerly a resident of Butte Co., but for the past two years a dweller in San Bernardino Co., has discovered there a tin mine.

The mine shows a face of 33 ft. in front, and cut in two places 150 ft. apart, a front of 22 ft. Some of the ore that was tested, yielded from 20 to 40 per cent. pure tin.

SAN DIEGO COUNTY.

BULLION.—San Diego *Union*, Jan. 11: About $400 was taken up by W. F. & Co's. Express. The mills have resumed work, and large shipments may be loooked for shortly.

JULIAN.—Cor. same: Our four quartz mills in Banner and this dist. have been kept crushing quartz nearly all the time for the last month.

Wilson & Leuzarder's steam stamp mill will soon be ready for business. They will commence work on the Helvetia mine, which they have bought, and from which they will be able to get quartz sufficient to keep their mill running.

SOLANO COUNTY.

QUICKSILVER MINES. — Vallejo *Chronicle*, Jan. 20: The Vallejo Quicksilver Mines, on Brownlie's ranch, have received considerable detriment from the late storms. One of their tunnels which has caved in several places, and it will be impossible to get timbers upon the ground to shore it up at present. This Co. smelted 20 flasks of quicksilver in their furnaces last week at one charge.

TRINITY COUNTY.

DOUGLAS CITY.—Cor. Trinity *Journal*, Jan. 13: The Portuguese miners on Smith's Flat are all busy at work.

On the western side of Reading's creek, near its mouth, Jesse is making good use of the high water eluicing away his top dirt.

Still further up Reading's creek, Butcher & Stigger are making fair wages on the west side. Above, Butts & Abbott have enlarged and extended the old "Treat Ditch," and are almost ready for work. In Clement's Ranch are located the celebrated claims of Smith & Wallace.

On a branch of Reading's creek, Scars is said to have a good-paying claim.

Nevada.

EUREKA DISTRICT.

NEW YORK CANON.—Eureka *Sentinel*, Jan. 17: In the Golden Gate shaft at a depth of 80 ft. a fine well defined ledge of free quartz was struck one day last week. The ore is strongly impregnated with a greenish-colored chloride of silver, and assays on an average about $125 per ton. Surrounding the milling or crystallized quartz, which is 5ft. in width, is a mass of decomposed carbonate ore susceptible of easy reduction by the ordinary smelting process. A drift has been cut along the ledge for 13 ft., with constantly improving prospects. The Fourth of July mine, is also improving in appearance. During last week, at a depth of 75 ft., a splendid vein of high grade ore was disclosed, and a large amount of ore was being brought to the surface. Assays have been obtained ranging from $80 to $125 per ton.

RUNNING FINELY.—The furnaces of the Cons. Co. are running finely, and bullion is being made at a rapid rate.

RICHMOND WORKS.—The furnace in course of erection will soon be in condition to add their quota to the already large amount now being produced there.

WILL STEAM UP.—The Lemon mill will get up steam for a trial run in a few days.

PROSPECTING. — During the pleasant weather of the last few days the hills have been full of prospectors.

ELY DISTRICT.

BULLION.—Ely *Record*, Jan. 18: W. F. Co. shipped since Jan. 4th bullion valued at $165,818.20.

YEARLY SHIPMENT.—The shipment for the year is about $4,000,000.

ASSAYED.—J. Cahill during the week assayed bullion valued at $52,778.06.

ELY DIST.—With only 75 stamps, our shipment of bullion for the quarter ending Dec. 31st, 1871, was $1,203,542.83.

CHAPMAN MINE.—On Friday last we visited this mine and examined all of its workings thoroughly. The shaft is 200 ft. deep, following the ledge, which is nearly perpendicular for that depth, and the ore is about 18 inches wide on an average. At the depth of 50 ft. a drift was run on ore, connecting the Chapman and Chapman No. 2 shafts. At the 200 ft. level a drift has been run east along the ledge for 28 ft. At this point the ledge is well defined, with good walls, and the ore is of high grade, giving a pulp assay of $200 per ton. The ledge is much wider at this point, a chamber having been opened which shows the ore to be fully 4 ft. in width. The Supt. has commenced to grade for a whim, which will be erected at once. The shaft is to be newly timbered.

INGOMAR.—This mine is on Panaca Flat, northwest of the old Panaca location. A fine vein of ore—the Lightner ledge—was struck in the drift on the 14th inst.

RICH STRIKE.—The Meadow Valley Co. struck a rich deposit and a large one too, in the 600 ft. level, east of No. 7 shaft, on Tuesday night. The mine is looking well in every department, and the large quantity of ore at the mill and the body struck, make this mine a good claim to invest in.

BULLION STOLEN.—On Thursday last 3 bars of bullion were stolen from the Salt Lake stage at Desert Springs station, while the driver and passengers were in the house eating supper. Two of the bars were found next day about a mile from the station.

NEWTON BOOTH.—They are drifting for the ledge from the lower level.

PAGE AND PANACA.—On the 15th inst. a fine body of ore was struck in the east drift running from the 155 ft. level. The ledge is about 4 ft. wide, with a pay streak of about 30 inches.

THE mines of the dist. are steadily improving in character of ore and extent of deposit as the work progresses. The Creole shaft of Raymond & Ely mine, shows a large ledge of very high grade ore. The Burke mine looks well although no ore is being hoisted at present. The Lightner shaft is steadily improving in every respect. The mill is constantly running on first class ore. The American Flag, Alps, Chief of the Hill and Meadow Valley are still hoisting the usual amount of ore. Page and Panaca, Newton Booth, Lafayette, Justice, Silver Chief and Chapman mines are energetically at work sinking, timbering and preparing for steady work.

ALPS is being worked by a full force of men. The ledge is larger at the lower level than ever before, showing over 6 ft. of fine milling ore. The Chicago mill is now running on ore from the Alps.

PACIFIC TUNNEL NO. 4.—This claim has been sold for a good round sum. The claim is directly west of the Chapman, is a true fissure vein and over 2 ft in width. Two hundred tons of ore on the dump together with the showing along the ledge, speaks for itself. Sufficient ore can be extracted to run a 10 stamp mill steadily.

HUMBOLDT.

BULLION.—Unionville *Silver State*, Jan. 20: Amount shipped from the Arizona mine, since our last issue, was $5,802.

WORK RESUMED.—Work has recently been resumed on some mines, several miles south of town, which were located several years ago.

DUN GLEN.—The new mill, recently built by Sprague & Co., at Dun Glen, is in operation, and the machinery working entirely satisfactory.

GOOD NEWS.—Humboldt *Register*, Jan. 20: From Battleville, Galena dist., we learn that the Nevada Butte M. Co. are going to start up their mill, and put a large force of miners to work on the Butte and Trinity mines immediately.

REESE RIVER.

MOHAWK MINE.—Reese river *Reveille*, Jan. 8: The following are the returns from the last working of ore from the Mohawk mine at the Manhattan mill; 3½ tons—first class—$2,536.92 per ton; 10½ tons—second class—$543.52 per ton; 21½ tons—third class—$194.78 per ton. The whole produced a net profit of $13,723.45.

STETEFELDT MILL.—The manufacturing of bullion has been suspended for a short time at the Stetefeldt mill in Belmont, owing to the breakage of the water jacket on the furnace.

WASHOE.

BELCHER MINE. — Virginia *Enterprise*, Jan. 20: This mine has never looked better than at present. Throughout a length of 320 ft. every stope, crosscut and opening of any kind on the great pay deposit, shows

magnificent ore. The north winze being sunk on the 1,100 level, is down 135 ft. It descends at an angle of 40 degrees and is all the way in ore of exceeding richness—ore average assays of which are from $150 to $200. On the 9th level of the old mine, where the ore body has been cut through, the pay ground is found to be 30 ft. in width and very rich.

KNICKERBOCKER MINE.—Work is progressing favorably on the new Knickerbocker shaft. It is being substantially timbered, and is divided into 3 compartments. A drift will be started for the ledge when the shaft shall have attained a depth of 500 ft.

SUTRO TUNNEL.—The Sutro tunnel is in a distance 2,687 ft. The ground in the face of the tunnel is very hard. Shaft No. 1 is down 34 ft. the ground works well. Shaft No. 2 is down 70 ft. the ground is favorable and some water is coming in. Shaft No. 3 is down 45 ft. in very hard ground, as in the case in shaft No. 4, which is now down 44 ft.

A LARGE amount of prospecting is at present being done in the Yellow Jacket mine. Little ore is being raised.

BELCHER AND CROWN POINT BULLION.—We yesterday saw upon the counter of the Bank of Cal. silver bricks from the Belcher mine valued at $50,188.20; also, Crown Point bricks to the value of $23,341.79, making a total of $73,529.99.

OVERMAN MINE.—The new shaft of the Overman M. Co. is down 446 ft.

JULIA MINE.—Work is progressing favorably. Their main shaft is down 500 ft. and the rock through which they are sinking is favorable in appearance. When their shaft shall have attained the depth of 1,100 ft. they will drift for their lead. They expect to be ready to drift in about 90 days. They have a belt of vein matter about 200 ft. in width, in which to look for ore deposits.

DANEY MINE.—Gold Hill *News*, Jan. 18: Work progress well, as usual, in this mine with fine prospects ahead. The drift for the ledge at the 500 ft. level in 100 ft. from the shaft, and the rock works well. At the 400 ft. level the main drift cut the ledge at 270 ft. from the shaft, and the drift north from it is 95 ft., following the ledge in fine looking quartz assaying from $6 to $10 per ton. The prospects for finding a good body of pay ore are better than for a long time.

ALPHA MINE.—Reno *State Journal*, Jan. 20: The Alphn M. Co. at Rye Patch, have just struck an extensive chamber of very good milling ore in their mine. It mills $70 per ton.

Arizona.

MINES AND MINING.—Prescott *Miner*, Jan. 6th: The quartz miners of Yuma and Mohave Co.'s are busily engaged, getting out ore. Yuma Co. will soon have another mill, that which Mr. Borger is bringing out, to work ore from the Constantia mine, near Ehrenberg. The miners of Castle Dome are still taking out ore and shipping to S. F.

In Mohave Co., a 5-stamp mill is being run.

In Yavapai Co., the Vulture Co.'s 40-stamp mill, near Wickenburg, is still busy freeing gold from its matrix. At Bradshaw every lick struck upon the Tiger, and Lorena lodes exhibits ore of wonderful richness.

In Pine Grove Dist., Jackson & Co., have been doing well, and have struck an abundance of water to run the mill 14 hours every day.

J. Rush has about made up his mind to place his little mill on the Hassayampa, at Walnut Grove, and to work ore from the Josephine and other lodes, which we know are rich in free gold.

Placer miners are still making something, on Lynx Creek and the Hassayampa.

The Benjamin and its "sister" silver lodes, near Prescott, are growing better as fast as developed.

Colorado.

SHIPPED.—Georgetown *Miner*, Jan 11th: Baily & Nott have shipped since our last issue 15 tons of smelting ore on account of owners.

Gen. F. J. Marshall, of the Marshall S. M. Co., sent forward last week, 2 car loads of smelting ore to Swanzea, valued at about $16,750 in coin.

Campbell & Clark have shipped on account of owners, since our last issue 10 tons of rich smelting ore.

Palmer & Nichols have shipped since our last issue, one silver bar, 900 fine, valued at $1,785.41, coin.

The Stewart S. Reducing Co. have shipped for the week, 4 silver bricks valued at $2,744 06 coin, and also one lead bar valued at $528.17 coin.

MONTEZUMA.—A fair ore vein has been struck in the Napoleon, and a great deal of native copper is found intermixed with the ore and vein material. Work on the Silver Wing lode is steadily progressing. All the machinery for mill of Boston S. M. Association, has been transported from Breckenridge to St. Johns. The mill of the St. Lawrence S. M. Co., amalgamating, and the mill of the Boston S. M. Association smelting and amalgamating, will be completed at an early day in the summer of 1872.

CENTRAL CITY *Register*, Jan. 3d: The stoping ground of Harper's claim on the California, 300 ft. from the surface still holds out, and is producing a very fine grade of mill and smelting ore, 2½ ft. in width. Mr. Harper has leased a claim to A. M. Jones, adjoining him on the west, and started a drift last Tuesday to open up this property. The breast of the drift discloses a view of the celebrated California ore over 2 ft. in width.

NICHOLS & Co. have loased and started the mill on the Cons. Gregory Co., at Black Hawk and are running it on Kent Co. ore.

THE Holbrook property, adjoining the Romine claim on the west, has been leased to Arden, Briggs & Co., who have commenced sinking, and are taking out a very fair grade of ore that is paying from 5 to 6 ozs. per cord. The shaft, 120 ft. in depth, is well timbered and in excellent condition for working. The lessees purpose sinking 30 or 40 ft. deeper, when they will commence drifting. This will give a stope something over 100 ft. in depth.

ITEMS.—Central *Herald*, Jan. 10th: During Dec. the Lenvitt lode yielded nearly $11,000. The crevice is from 4 to 6 ft. in width and the ore is very easily mined. Assay give from $100 to $400 per ton. The greatest depth reached in the mine is 200 ft. B. S. Bnell has just leased the ground on either side of that worked by Mellor. There is a very large quantity of ore in sight, and the prospects are that the past unusual yield will continue for a long time to come....The Kansas Co. are meeting with fair success on the property purchased of Hardesty on the Kansas lode. Last week's return gave a retort worth $1,000. ....Capt. Philip's claim on the Jones is paying well.....Waterman's Enreka 20-stamp mill is crushing Sndeberg ore for N. Young & Co. and for Kenwing & Quail, their ore being from a lode just south of the Gardner, on Quartz hill.....The Stevens 14-stamp mill at Black Hawk, is running on quartz from the Cincinnati, and from the Rob. Emmet. The former is not paying as well as formerly, but the latter has the appearance of being very valuable. ....Cave & Mollor have again came into rich pay on the Gregory Second, and keep 5 stamps employed at the Mellor & Borum mill. The remaining 15 stamps are crushing Leavitt ore....Mead's mill is crushing ore from the Gunnell, Burroughs and Roderick Dhu lodes.

Idaho.

LOCAL RECORD.—Silver City *Avalanche*, Jan. 13: The North Oro Fino Discovery continues to yield 25 to 30 tons per day—which is worked at the Owyhee Co.'s mill. A. P. Minear, is running it in connection with the South Oro Fino, belonging to the Ida Elmore Co. The latter mine is yielding about 25 tons of ore daily. Mr. Minear is also working the North Oro Fino Co.'s ground through the same shaft, and has let a contract to run the 3d level drift in the Discovery claim to the line, which will break through into the 2d level of the North Oro Fino, where there is already a large body of ground opened.

The 7th level drift of the Ida Elmore is in about 40 ft. on the rich body of ore lately discovered in that portion of the mine. Some of the ore will be worked in the Co.'s mill next week. The 6th level drift, in the same mine, is also being driven north.

Stoping is actively going on in the 8th level of the Golden Chariot, where the vein is over 2 ft. wide and the ore of excellent quality. Next week there will be 500 tons ready for the mill.

The Minnesota mine bids fair to be one of the best mines in camp. Drifts are being run both north and south as fast as possible on a good vein of ore, which is easily worked in both the mine and the mill. Ten stamps of the Elmore mill have been running on Minnesota ore for the last 2 weeks. It pays about $60 per ton chiefly.

The Mahogany is turning out richer ore from its 4th level than was ever before seen in that mine. Drifts are being driven both north and south on the 4th level, also a winze from the 3d level down.

There is quite an exciement about the ore in the 4th level of the South Chariot, which is very rich. The ore from that drift will be worked this week.

In the War Eagle mine a winze is being sunk from the 2d to the 3d level, about 100 ft. south of the shaft through a rich chimney of ore.

Montana.

PHILLIPSBURG.—Deer Lodge *Independent*, Jan. 13: Brown & Co. are working 11 men on the Cordova ledge. They have an 8-ft. ledge of good ore. The St. Louis & Montana M. Co. have let a contract to run a tunnel to the Camanche ledge. Brown & Co. have a body of ore 10 ft. wide in the Eastern Camanche that is considered fair milling ore. Col. Lyon has started up his furnace on Speckled Trout ore. The smelter works well. The ore smelted so far pays $150 per ton. Estell & Holland have about 200 tons of first-class ore ready to haul to the mill.

MILL CREEK.—The Fry lode 1½ miles above the Pioneer Tannery, on Mill Creek, has been opened to the depth of 20 ft. and shows a well defined lode of gold-bearing quartz, from 7 to 11 ft. thick. A large quantity of ore has been taken out. The ore already milled has paid $45 to the ton.

J. How is running the Oro Cacho mill, Summit Co., on rock from the mine of the same name, with favorable results.

JEFFERSON MINES.—Helena *Gazette*, Jan. 8: Bell & Co. are at work on their lode, the "El Dorado," and have been taking first-class ore out of both shaft and tunnel, and still there is a large body of ore in sight. The "Minnesota" is being worked by the owners, and, is considered to be the best lode in the dist. There are quite a number of miners in camp prospecting and running tunnels, trying to tap lodes they have discovered heretofore. Among the latter, are Dr. Brooks & G. Gregorie, whose tunnel, running to one of their late discoveries, bids fair for galena soon. J. Halford is running a tunnel for the "Self Supporter" with fair prospects of a good "streak".

Utah.

BULLION.—Salt Lake *Tribune*, Jan. 11: W. F. & Co. forward to-day to New York, 17 bars from the Raymond & Ely works, worth $51,134.57. On the 16th, (same paper Jan. 18,) they forwarded to same place from Meadow Valley works, 7 bars, worth $9,087,81, and on the 18th. they forwarded 4 bars, 316 lbs., valued at $5,172.89 from the Pioche S. M. Co., also consigned to New York.

N. P. WOODS shipped from the 12th to the 15th of Jan., about 17 car-loads of base bullion to Omaha, one car-load going to Chicago.

COLUMBIA DIST.—The mines that are being worked are the Chimney Corner, Gold Eagle, Champion, and the Washington.

Chimney Corner is down on an incline 35 ft., showing bunches of chloride ore which appears to be very rich in silver.

Gold Eagle has been lying idle for some time owing to a conflict of titles. The original owners have, however, resumed work at their discovery shaft with the view of sinking and drifting through to the Augusta which is about 150 ft. south of the original discovery of the Golden Eagle.

Champion Co. have tapped their ledge at a depth of 35 ft. in their tunnel, exposing a large body of gray carbonate and apparently rich in silver.

The Washingtons are improving as work progresses.

A new discovery was made last week by Cox & Linton on Liberal Hill, about 150 ft. east of the Champion mine and probably the richest discovery in the dist. Very little has been done and a large body of ore is in sight that assays high in silver.

AMERICAN FORK—The Sultana works are in a flourishing condition. The Co. employ 40 teams day and night and are making a very successful run on their furnaces, having 100 tons of bullion already on hand, and coal enough to smelt 200 more. The ore in the mine (the Miller) seems to be holding out well. A contract has been let for the delivery of 1200 tons.

EAST CANON.—Cor. same: On the north side of this canon, about 6½ miles from town, very rich deposits have been found. Further up the mountain and we come to the San Joaquin in 50 ft. Chloride Gem, rich ore. Chrysopolis, down 60 ft. with rich ore. Cricket, very rich. Lineoln tunnel, Sphynx, Ward Beecher, Silver Emporium, etc., all evidently good mines. The Mariposa, Marvin and other prospects, all chloride ores. On Office Hill are several good prospects. On Base Hill (so called) are the Sevier, Veloeipedes 1 and 2, Miner's Delight, Silver Shield, Wild Delirium, Hidden Treasure, Fairview, McCullum, Antelope and others—all yielding good smelting ore and apparently heavy bodies.

In Dry Canon we have the Fourth of July, Chicago, Soverign, Kearsarge, Monitor, Silver Eagle, Uncle John, Crown Point and others. The foothills abound in rich deposits and contain several good leads. Below Ophir are a number of leads and prospects located by the English Co.

The El Capitan, a mine on Chloride Hill, is promising well. It has a vein of ore 16 inches in thickness, which assays on an average $300 per ton.

The Clark and Gardener is yielding considerable ore, which is worth $180 per ton.

Rich discoveries have lately been made on Shoo Fly Hill, consisting of horn and native silver.

Arastras are doing well. One started a few days ago by Williams & Co., works up to 70 per cent. of the assay value of the ore. The Ophir M. & S. Co. will start their furnace again next Monday.

Mr. Akin will have his furnace ready by the last of the month, when it is understood the Pioneer Mill will again steam up.

COMING.—Salt Lake *Review*, Jan. 18: The machinery for the construction of a 20-stamp mill, for the Sparrowhawk M. Co. of Camp Lloyd, is expected to arrive within a week.

S. F. Stock Exchange Board.

SAN FRANCISCO, January 25, 1872.

Mining stocks have been unusually active during the past week. The San Francisco Stock Board will hereafter meet at 10½ A.M. instead of 11 A.M., a change caused by pressure of business. The new stock of the Daney Mining company is ready for delivery; on surrendering certificates holders will receive three shares of new issue for one of old. From January 6th to January 23rd the receipts from the Meadow Valley mine were $66,000. The December receipts from the Original Hidden Treasure mine, were $12,515 from 600 tons of ore.

The sum of $7,060 was received here last week from the Succor mine. Nearly 700 tons of ore were extracted from the Hale & Norcross mine last week. From the Savage, 300 tons were taken, averaging $38 per ton. For the week ending on the 21st inst. 1,820 tons of ore were taken from the Crown Point; assay value $86,000. For the week ending last Saturday, the North Star mine shipped $7,050. On the 16th inst. $8,000 were sent down from the Minnesota mine, taken from 137 tons of ore.

The Pioche West Extension company have elected the following Trustees:

H. Kozmiensky, Charles Forman, A. E. Head, Augustus J. Bowie, Jr., and M. J. McDonald; Spring Mount company, H. A. Lyone, L. Maynard, Thomas Bell, J. W. Gashwiler, and C. D. O'Sullivan; Ely Consolidated company, H. A. Lyons, Ogden Hoffman, C. D. O'Sullivan, M. Skelly, H. Kesmiensky.

HOISTING WORKS BURNED.—The hoisting works of the Manhattan company on Gold Flat, near Nevada City were burned on the night of the 19th inst. The loss is about $3,300; origin of the fire not known. These works were built more substantially than those destroyed by fire last October, when the loss was $25,000. The Manhattan company seems to be afflicted by fires.

TOTAL RAIN-FALL.—At Green's Ranch, four and a half miles from Davisville, Yolo county, from Nov. 7th to Jan. 10th, was 24.03 inches.

Artesian Wells.

Important Results Obtained in Los Angeles Co.

The remarkable success attending the efforts of artesian well prospectors, in the vicinity of Santa Ana, is really astonishing. Fine flowing wells have been "struck" in all portions of this county, but an unusual number of them seem to have been especially successfully bored in and around Santa Ana. The low depth at which these wells are discovered is a matter of surprise. One would imagine there must be a sheet of water covering an area of many miles, a few feet under the surface; at all events the indications point that way, and strengthens the supposition, as six wells have been struck during the last year, the deepest of which is the San Joaquin well, which did not answer to the "call of the augur" until a depth of one hundred and forty feet was reached. Most all of the other five wells commenced to flow at a much shorter depth than the San Joaquin well. A fine flow of water was obtained by Mr. McCullough on his place last summer, at the exceedingly shallow depth of twenty-nine feet; another shallow well about a half mile from this one, was struck last spring by Mr. McFadden, at the low distance of thirty-nine feet beneath the surface. So confident was Mr. McFadden of securing artesian water that he did not go to the expense of buying any kind of well-boring material, but constructed a simple boring instrument, after his own notion, which was anything but artistic. He depended principally on luck, and the irrepressible presentiment that an entire sea of fresh water laid a few feet under the ground in his vicinity.

This well throws a constant stream of water, twenty-one inches in circumference, to an elevation eleven feet above the ground. The water is always cold, and as pure as crystal. Two and a half miles from this well is another that throws a column of water several feet high. This one was struck at the distance of ninety-one and a half feet, on Welche's ranch. Another well, from which a fine flow of water was obtained, was opened with the commonest instruments, on Mr. Laymau's place, and water obtained at a distance of twenty-seven feet.

Mr. Weigan entered into the well-boring mania with considerable enthusiasm, anticipating that he would strike water at a very short distance from the top of the earth; but unfortunately he did not touch the spontaneous fountain until the earth had been penetrated one hundred and thirty-five feet. He has all the water he wants, and some to spare in case of drouth.

Thus it will be seen that, within a radius of four miles, six of Nature's perpetual pumps are in operation, throwing up and distributing at least one million gallons of water per day.

The earth is bound to have a certain quantity of water that can either be utilized or saved for future use, by catching the water in a reservoir or plugging up the artesian pipe and stopping the flow.

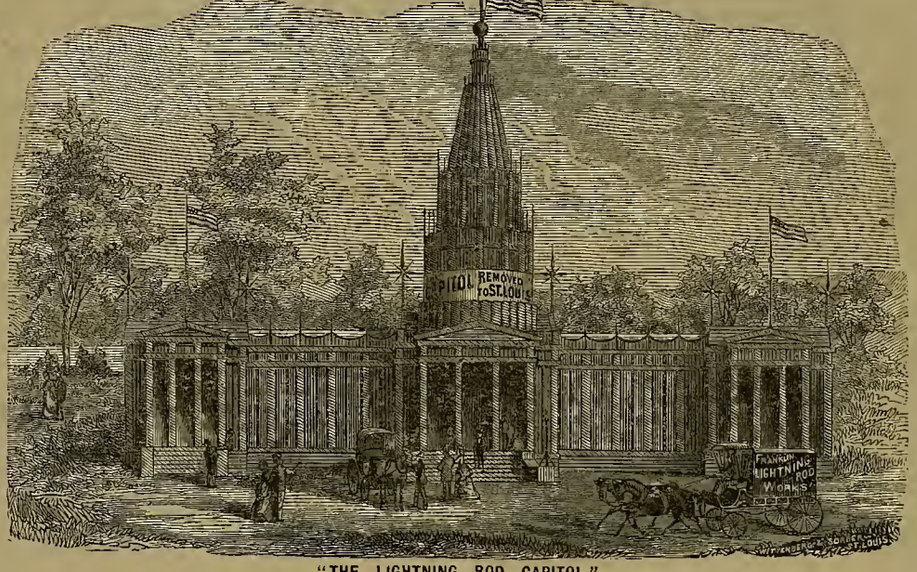
There are about one hundred artesian wells throughout the county. Probably half of them are in good running order. The business made in this line as an assistance to agriculture in this county is really wonderful. Three years and a half ago there was not an artesian well in the lower country, and to-day we have in this county alone, enough of them to redeem the country from drouth, should that plague visit us again.—*Los Angeles Star.*

Low Barometer in Polar Regions and in Cyclones.—Observations show that there is a marked depression of the barometer in the polar regions and in the central part of cyclones; but no very satisfactory explanation has as yet been given of the cause of this phenomenon. Reliable observations show that there is a depression of *more than one inch* below the average at the equator, in that portion of the Antartic region which has been visited by observers, and about half as much in the Arctic region. It is also known that during the continuance of a cyclone, the barometer stands from *one to two inches lower* in the central portion of the same, than when exposed in the exterior part.

Learning makes life sweet.

The Lightning Rod Capitol.

Since the St. Louis Fair, held in October 1871, has taken such a conspicuous place among such exhibitions, an illustration of some of its peculiar displays will be of interest. A number of the exhibitors, in a healthy competition, spent large sums of money in placing their articles as conspicuously before the public as possible; but perhaps the most extensive and liberal preparations were made by Messrs. Cole Bros., proprietors of the Franklin Lightning Rod Works, 723 South Seventh St., St. Louis. This enterprising firm, desiring to show their work to the best advantage, conceived the idea of hitting upon a popular question of the day, and constructed a miniature representation of the United States Capitol, built wholly of lightning rods, and inscribed "The Capitol removed to St. Louis."



"THE LIGHTNING ROD CAPITOL."

The hit was a happy one, and the unique structure was surrounded by thousands of spectators every day of the Fair. The building, of which our cut is a faithful representation, was 45x22 and was surmounted by a dome 45 feet high, the whole composed of lightning rods of various sizes kinds and colors, ingeniously arranged and combined as shown. More than 60,000 feet of lightning rods entered into its construction, jet black iron, bright copper, and white rods, being harmoniously blended, to form the walls, while a gorgeous display of glittering stars, gilded balls and silvered tops, ornamented its front and dome. The total value of materials used was nearly $10,000, and when the sun shone on this glittering mass, bristling with points and other ornaments, the effect was dazzlingly beautiful and challenged universal admiration.

The Wheeler Expedition.

The Wheeler Exploring Expedition, sent out last spring to examine the country between the Pacific Railroad at Elko and Southeastern Arizona, has completed its labors; but the results of the expedition will not be properly known until communicated to the public by the publication of the official report at Washington. We have learned enough, however, to satisfy us that a large amount of valuable and interesting information has been obtained.

The expedition examined the topography of a district about seventy-five miles wide and six hundred long. Thirteen main topographical points were determined precisely, and many minor points approximately. The country from Elko to the Colorado was found not unfavorable for railroad purposes. In Arizona a considerable district occupied by hostile Apaches was examined and its topography communicated to General Crook. The mines along the route were carefully inspected and a large mass of information of an industrial character collected. The great cañon of the Colorado was ascended for sixty-five miles from its mouth.

The photographer was kept constantly employed, and has obtained views of all the prominent places. The San Diego *Union* says that when the results of the labors of the photographers are given to the public, a sensation will be created; for among the scenes he has portrayed by the aid of the camera, are some of the most grand and striking conceivable.

The report of the Mineralogist on the mining resources of the Territory of Arizona will show that the mineral wealth of that country has not been overestimated. The new silver mines recently discovered in the Pinal Mountains were examined, and Dr. Hoffman gives it as his opinion that they are unequalled by any mines yet discovered on this continent. The expedition will undoubtedly result in throwing more light on the history of the mysterious Aztec race. Many ruins never before heard of, were discovered by the explorers, and sketches and photographs of them made, and their surroundings carefully noted. The report of Lieutenant Wheeler, when ready, will only be equalled by a descriptive book from the pen of Dr. Hoffman. The former will possess statistics and information invaluable to the student, and the latter will be pleasing to the lover of stories of strange adventure in an almost unknown country.

Great Bee Fight.—The Jackson (Tenn.) *Whig and Tribune* of a late date, relates the following interesting account of the resentment and courage of the honey bee. Capt. Brown, of this city, recently robbed three hives, and Dr. West, a neighbor, robbed four. The bees, thus deprived of the fruits of their labor, became furious; and unitiug, making an army of seven hives, they invaded the premises of Mr. Horace Bledsoe, and made a fierce attack on five of his hives. Bledsoe's bees were taken by surprise, aud although outnumbered, fought for their homes with desperation. The battle lasted several hours, and four of Bledsoe's hives were literally destroyed. The invaders were finally repulsed, after being almost annihilated. The grouud for yards around was black with dead bees. Mr. Bledsoe, although a serious loser, buried the dead warriors with the honors of war. Few of the invaders survived the battle, and from out of five of the defending hives, four were destroyed. It was the bloodiest bee battle on record, and deserves to be handed down to posterity.

Grape Sugar.—The manufacture of this substance in Germany in 1868 occupied sixty establishments, which produced in that year 22 million pounds of syrup, and 8,800 pounds of sugar. Since that time, the industry has much increased, and large tracts have been applied to the cultivation of potatoes from which the grape sugar is manufactured.

Gold and Silver.

Twenty years since, when California gold discoveries had become fully demonstrated, a sort of panic set in among the governments of Western Europe, to a lesser extent in England, and more modified in the United States. The question which presented itself was the probable change in the value of gold consequent upon its increased abundance. It was supposed that, both in relation to silver and other commodities, gold would have a lower value; that is, that a perpetual fixed income, like an annuity, or a ground rent, would gradually diminish in real value, so the recipient of, say $1,000 per annum, would gradually get less and less for the money as its purchasing power diminished. Most governments appointed Commissioners to investigate the matter. The United States passed the Mint bill of 1852, which made gold alone a legal tender. The French did the same; but Holland, under the supposition that if gold alone was produced in greater quantities it would lose its relative value, but that silver would maintain its position, adhered to silver alone as the standard by which permanent incomes would retain their purchasing power. It happened, however, that for the first ten years of gold production here, aided by Australia, gold did not much deteriorate in value, and its relative value to silver, 15½ to 1, was not changed. In the last ten years, however, a change has taken place, not in respect to silver, but in relation to commodities, and the fact shows itself in greatly increased expenses of living all over the world.

It is estimated that in England $4 now is not more than equal to $3 ten years since. On the continent of Europe the change is still greater, and still more in Australia and the United States. But throughout India the purchasing power of money has undergone still greater reduction. An important element of this change in the last ten years has been the United States war. When the war broke out there was in circulation about $200,000,000, bank notes, and $300,000,000, coin. There is now in circulation $700,000,000 of paper money, and little or no coin. The latter has passed off into the markets of the world, greatly increasing the general supply. At the same time there was a great reduction in the quantity of commodities produced—cotton, tobacco, rice, manufactures, etc. Of the first article, India became the source of supply, and silver poured out of Europe profusely into the Indian market for raw commodities and for railroad construction, so glutting it that English official reports show that the natives used the silver for wagon tires and other unusual purposes. The gold of the United States and Australia more than supplied the vacuum caused by sending the silver to India, and a rapid decline in the purchasing power of money has taken place. Such a moment is the favorable one for a return to specie payments in the United States; to call in the superfluous paper money and substitute the coin. But there are no signs as yet of such a consummation.

The prospect now is of a reflux from the India market and from China, while the production of silver on this coast promises to rival that of gold. A London financial authority states, in relation to the Indian flow of silver: "The reader can draw from this his own conclusions; for it is undeniable that the yield of silver is rapidly increasing on the Pacific Slope, and soon will attain to such dimensions that there will be a material fall in the value of the metal. The broad rule ought therefore to be kept in view that a fixed income is less desirable than an income derived from real estate or industrial undertakings, for it undergoes a diminution in its purchasing power through a constant, if slow, process, which must, however, be felt severely at the end of ten or twelve years." Without assenting to the full scope of this proposition, since there will no doubt be a restored activity in the production of commodities, which will tend to compensate for the increase of the precious metals and maintain an equilibrium, there is no doubt but the part California is to play in the world's operations will be more important in the future than in the past.

Useful Information.

Sardines, Where They Come From and How Preserved.

There are few delicacies so well known and so highly esteemed as the sardine. The delicious flavor of the fish when the tin is first opened, and the sweetness of the oil (always supposing a good brand,) print their charms upon the memory. It will be unwelcome news, however, to many to be told that anything good in this way is exceedingly scarce this season. Unfortunately, it was the same last year. Then the destroying demon of war took away the fishermen from the villages, and, added to this, the fish were scarce, so that more were contracted for than could be delivered. This year it is worse. Few fish of any size have been caught (except some very large,) least of all those of the finest quality. The consequence is, the French manufacturers are again unable to carry out their contracts.

The fishery, says the London *Grocer*, is carried on generally from July to November, all along the west coast of France. Two of the largest stations are at Douarnonez and Concarneau. Fleets of boats go out some few miles and spread out their nets, by the side of which some cod roe is thrown to attract the fish. The nets are weighed on one end and have corks attached to the other so that they assume a vertical position—two nets being placed close to each other, that the fish trying to escape my be caught in the meshes. Brought to land, they are immediately offered for sale, as, if staler by a few hours, they become seriously deteriorated in value, no first-class manufacturer caring to buy such. They are sold by the thousand. The curer employs large numbers of women, who cut off the heads of the fish, wash, and salt them. The fish are then dipped into boiling oil for a few minutes, arranged in various sized boxes, filled up with finest olive oil, soldered down, and then placed in boiling water for some time. Women burnish the tins; the labels are put on, or sometimes enameled on the tins, which are afterwards packed in wooden cases, generally containing 100 tins, and then are ready for export.

It does not always seem to be remembered that the longer the tin is kept unopened the more mellow do the fish become; and, if properly prepared, age improves them as it does good wine. But if they are too salt at first, age does not improve them—they always remain tough. The size of the tins are known as half and quarter tins. There are two half tins, one weighing eighteen ounces and the other sixteen ounces gross. The quarter tin usually weighs about seven ounces, but there is a larger quarter tin sometimes imported. Whole tins, and even larger ones still, are used in France, but seldom seen here.

As is well known, the sardine trade is an important branch of industry, very large quantities being consumed in France; and the exportation to England and America is truly wonderful—*Scientific American.*

Progress and Popular Science.

M. Sogg, of Neuchatel, writes to the Editor of *Les Mondes* as follows: "Since the world is inclined to ridicule your attempt to popularize science, permit me to ask what is the science which loses itself in the clouds of thought without a desire to come down to the practical, other than an error, the glory of standing by the side of those other honors which elevate the individual and debase the nation? What would astronomy be if it did not serve to measure time and to guide us on our way upon the land and sea? To separate pure science from applied science, is to condemn each to sterilty; they can no more exist alone than our heads can exist without our arms and legs.

"Thenard would be fogotten if he had not found the cohalt blue which bears his name; it is alkimetry and alcohometry which have rendered popular the name of Gay-Lussac, and, in spite of all his admirable works, the name of Chaptal would he forgotten if he had not connected it advantageously with the manufacture of beet-root sugar.

"Consider how the intelligence of our great men is developed and you will find always that they step upon the scientific stage with works as brilliant as they are useless to human society; later on and gradually, experience, the daughter of age, teaches them to devote themselves to practical application, and they are more pleased with and more proud of having perfected an industrial process, found the formula of a fertilizer, or discovered a new ailment, than if they had devised one of those brilliant theories which flash across the scientific heaven like falling stars, in the space of the firmament, and leave no trace behind."

Glycerine Composition for Leather.

As is well known, glycerine has found extensive application in tanning, as it has been discovered that it adds materially to the elasticity and strength of the leather. Especially has it been found of great value in protecting leather bands of machinery from cracking and drying. The partially tanned leather is immersed for considerable time in a bath of glycerine, by which the pores are filled and such an elasticity and softness is imparted that objects manufactured from it are less liable to break.

In order to prepare a neutral gutta-percha composition with glycerine take 3 to 4 pounds lamp black, ¼ pound burnt bones (burnt ivory), cover up in a suitable vessel with 5 pounds glycerine and 5 pounds common syrup, and stir well until the whole is intimately mixed and free from lumps. Four or five ounces of gutta-percha, finely cut, are to be put into a kettle, and after melting must be mixed with 20 ounces of sweet oil and dissolved, and two ounces of stearine added. While still warm the gutta-percha solution must be incorporated with the syrup and lamp black and after this is done, ten ounces of Senegal gum dissolved in 1½ pounds of water is also added. In order to impart an agreeable odor to the mass a small quantity of rosemary or lavender oil may be introduced.

In using, the glycerine gutta-percha paste must be diluted with three or four parts of water. It gives a fine lustre and, as it contains no acid, it does not injure the leather, but makes it soft and elastic and adds very much to its durability.—*Journal of Applied Chemistry.*

Lint.

Next to cotton, the vegetable fibre most extensively used for textile fabrics is flax, the Latin name of which is *linum*,—hence come the names of linen and lint. The fibres of cotton and flax, viewed under a microscope, will be found to be different; the fibre of cotton is angular, or bladed, while that of flax (linen) is perfectly round and smooth. It is this difference in their natural formation that constitute the superiority of linen over cotton as a material for dressing wounds, or as a fabric for clothing the body. Lint is the unwoven fibre of linen. By wear, and much washing, which it necessarily undergoes, linen becomes softer than when new; it undergoes a partial decay, and the much-prized linen eventually becomes "rag." In this state it is fit only to be converted into paper or lint. Lint is, in fact, the woolly fibre of old linen, "thrown" or slightly "felted" together (as manufacturers term it) into the material form so named. The flax plant yields not only linen by means of its fibre, but it also, by expression, gives a valuable oil from its seeds, known in commerce as liuseed oil. The residue, after the oil is expressed, is called linseed cake, and excellent food for cattle. Each product of the flax plant, both in peace and in war, has its value either as linen, linseed, or lint.—*Scientific American.*

How to Use the Thermometer.—Signal Officer Singleton, of St. Louis, alluding to some statements respecting discrepancies between government reports of the weather, the state of the thermometer, etc., and those made by private individuals, says: "A thermometer should be placed in an open space, out of the vicinity of high buildings, or any object that impedes the free circulation of air. It should face the north, to be always in the shade, should be twelve inches from every neighboring object, should be about fifteen inches from the ground, and should be protected against its own radiation to the sky, and against the light reflected from neighboring objects, or the ground itself. The thermometer should be read as rapidly as possible, as the heat from the body or the breath influences the instrument. I have taken a thermometer belonging to a gentleman in this city, that read seven degrees above the standard instrument in this office, and after removing the back, which was of metal, painted black and varnished, (with a radiating power of seventy-seven degrees at night), placed it in my instrument shelter, after ascertaining the error, by my standard, (which was but three-tenths degrees, the instrument being an imported article and very fine), I found it to read exactly with the standard. Out of 470 observations at all hours of the day and night it varied but once, and then was but two-tenths degrees.

Good Health.

Why do Not Our Teeth Last a Life Time?

That our teeth are made perfect, if the right materials are furnished, there cannot be a doubt. But are the necessary elements furnished to children as they are to the young of other animals? And do we not subject our teeth to deleterious influences from which animals that obey their natural instincts are exempt? The forming young of other animals, while depending on the mother, get lime, and phosphorous, and potash, and silex, and all the other elements of which the teeth are composed, from the blood or milk of the mother, and she gets them from the food which Nature provides containing these elements in their natural proportions.

But where can the child in its forming state get these necessary elements, whose mother lives principally on starch and butter, and sugar, neither of which contains a particle of lime, phospherous, potash or silex? Nature performs no miracles. She makes teeth as glass is made, by combining the elements which compose them according to her own chemical principles. And this illustration is more forcible, because the composition of the enamel of the teeth and of glass is very nearly identical, both, at least, requiring the combination of silex with some alkaline principal.

If, then, the mother of an unborn or nursing infant lives on white bread and butter, pastry and confectionary which contains no silex, and very little other elements which compose the teeth, nothing short of a miracle can give her a child with good teeth, and especially with teeth enameled. But what article of food will make good teeth? Good milk will make good teeth, for it makes them for calves. Good meat will make good teeth, for it makes them for lions and wolves. Good vegetables and fruit will make good teeth, for they make them for monkeys.

Good corn, oats, barley, wheat, rye, and indeed, everything that grows, will make good teeth, if eaten in their natural state, no element being taken out; for every one of them does make teeth for horses, cows, sheep, or some other animal. But starch, sugar, lard or butter will not make good teeth. You tried them all with your child's first teeth, and failed; and your neighbors have tried them, and the result is that a man or woman at 40 with good, sound teeth is a very rare exception.—*Philosophy of Health.*

Glycerine as Food and Medicine.

Glycerine is one of the most valuable articles our pharmacopia can boast of, while as an article of food, it is one of the best and most fattening nutriments. Sweet oil, or olive oil, has for ages been an article of daily diet in Palestine and other old countries, and glycerine is an essence of it. It is a perfectly natural and bland fluid, and the most penetrating, perhaps, in all Nature. Oil itself will penetrate where water will not, and glycerine, which may be considered the etherial part of oil has this property to a most remarkble degree—it penetrates the solid bone.

A medical journal tells us that if poured into a mixture of blood and matter, such as is expectorated from consumptive lungs, it will get between the globules of each and show them with greater distinctness. Being thus penetrating, it is the very best application for feverish sores, for inflamed or dry surfaces, simply from its quality of penetration and evaporability. If applied with a common brush to the surface of the throat in diptheria, in a few minutes its permeative quality enables it to sink between the molecules of the false membrane, dissolving and detaching it in a few hours. It is the best application known in case of burns.

Glycerine for Putrid Sore Throat.

Dr. J. D. Palmer, in the *Journal of Pharmacy*, says: I have found this an invaluable remedy in putrid sore throat, as well as in many other affections. Not long since a case occured in which its healing properties were fully tested. The patient, a little girl, seven years of age, had been suffering several days before I saw her, and the various remedies employed had made no impression on the disease. As it was with great difficulty and pain she swallowed, and her pulse being very weak and quick, it was important that the remedy adopted should possess healing, nourishing, and antiseptic properties; and glycerine possessing these properties, was administered in teaspoonful doses every six hours. The first dose caused some smarting, the second less, and before giving the third there was obvious improvement. The case was dismissed in three days.

The Unwearied Action of the Heart.

The effect of everything that touches the heart is multiplied by the intensity of the heart's own changes. Hence it is that it is so sensitive, so true and quick an index of the body's state. Hence, also, it is that it never wearies. Let me remind you of the work done by our hearts in a day. A man's total outward work, his whole effect upon the world in twenty-four hours, has been reckoned about 350 foot-tons. That may be taken as a good "hard day's work." During the same time the heart has been working at the rate of 120 foot-tons. That is to say, if all the pulses of a day and night could be concentrated and welded into one great throb, that throb would be enough to throw a ton of iron 120 feet into the air. And yet the heart is never weary. Many of us are tired after but feeble labors; few of us can hold a poker out at arm's length without, after a few minutes, dropping it. But a healthy heart, and many an unsound heart, too—though sometimes you can tell in the evening, by its stroke, that it has been thrown off its balance by the turmoils and worries of life—goes on beating through the night when we are asleep, and when we wake in the morning, we find it at work, fresh as if it had only just began to beat. It does this because upon each stroke of work there follows a period, a brief but a real period of rest; because the next stroke which comes is but the natural sequence of that rest, and made to match it; because, in fact, each beat is, in force, in scope, in character, in everything, the simple expression of the heart's own energy and state.—*Appleton's Journal.*

Throat and Lung Diseases.—Most of the throat and lung diseases, which indirectly lead to consumption, are occasioned by sheer carelessness. A delicate woman often sits for two or three hours in a crowded theater or church, breathing an atmosphere tainted by the exhalations from the lungs of hundreds of other people, her system is exhausted, her skin is excited by unwonted action, and when she leaves the building and goes out into the cold air her blood is suddenly driven to the interior of the body, and then ensues a more or less permanent congestion or inflammation of some of the internal organs—usually the air tubes in or leading to the lungs. This process being repeated many times, a chronic bronchitis is finally established in persons otherwise healthy, and life is ever after rendered miserable by this periodical overheating and sudden chilliug of the body, even if the more dangerous malady, consumption does not interfere, and put the abused body into the grave.

New Use for Electricity.—Electricity has achieved a new triumph. Already employed to restore vigor and nimbleness to the gouty limbs of decrepit *bons vivants*, the recent discoveries of Dr. Bernier, a French physician, show electricity to be an efficient remedy for the evil effects of excessive drinking on the human nose. The doctor maintains that, by the application of an electric current to noses even of the most Bacchanalian hue, the flesh may be made "to come again as the flesh of a little child;" and he supports his assertion by a case performed on a female patient of his own, a woman of high rank.

Female Physicians.—The prospects of medical education for women are brightening. The medical faculty of Moscow, Russia, it is stated, have not only decided that the privilege of acquiring a thorough medical knowledge would be of utility to women, but have "resolved to admit them to the educational courses and lectures of the University, and to the privilege of following all the labors of the Medico Chirurgical Academy."

To Stop the Bleeding from Leeches. Make a ball of cotton about the size of a pea; put this pellet of cotton or lint upon the wound; press it down firmly; keep up the pressure for a quarter of an hour. Remove the finger cautiously, taking care to let the pellet remain.

Turpentine for Headache.—Dr. Behbie, of the Edinburgh *Medical Journal*, advocates the use of turpentine for the headache to which nervous women are subject.

To Prevent Discoloration from Bruises.—Apply repeatedly cloths wrung out of hot water, or the tincture of arnica.

Notices to Correspondents.

Editors Press:—Will you please inform me in what order steme drop in a six-etamp hattery. J. W. Mc.

Some 25 combinatious can be made with a battery of the size you speak of, and no two stamps drop together. It is always advisable that no two stamps follow each other. Supposing the stamps to stand in their order 1, 2, 3, 4, 5, 6, a good order for them to drop in, is 6. 2, 4, 1, 3, 5. Among the other combinations are. 1, 3, 5, 2, 4, 6, and 2, 5, 3, 6, 4, 1. Different mill-men have their own theories on this subject, hut the first order given will answer your purpose as well as any. Some people consider this a good order, 1, 2, 6, 5, 3, 4. hecause it brings the wash to the center, but by this combination the stampe follow each other more consecutively than you might think proper.

Mining Sales.

It is reported that the Pennsylvania mine, near Nevada, has been eold in this city to an English company. The amount paid is stated at $150,000.

The I X L and Buckeye No 1 have also heen purchased hy an Englieh company. The price is not stated. These mines are located in Scandinavian Cañon, Silver Mountain District, Alpine Co. According to the Silver Mountain *Chronicle* there are probably no better mines in the county.

The I X L made a ehort run a few years ago and ehipped some $50,000, but incompetent management soon demoralized the company, and for several years past no work has been done. In the Buckeye shaft, when rich ore wae reached, a heavy hody of water drove out the miners and the company heing unable to erect the necessary hoieting and pumping works the mine has lain idle for a long time. The plans of tho new owners for working the miues are said to be on an extensive scale, and will give employment to a large number of men.

Hints to Miners—No. 8

The proper oleaning and retorting of gold amalgam is an art which all mill-men do not understand. It is often found difficult to separate the amalgam from iron. The bullion comes from the retort looking like soot, yet the management of amalgam is simple and when once understood there need he no failure. We do not say that many amalgamators do not thoroughly understand it; it is for the inexperienced that this is written. To those who have had hut little practice we trust that a description of the whole process from the starting of the mill, until the retorting is completed, will be interesting and useful. In preparing this description we have made free use of some notes placed at our disposal by Mr. H. G. Hanks, one of the most experienced assayers of this city.

Amalgamating in the Battery.

When quicksilver is ueed in the battery, the art to acquire is how to introduce just the proper quantity to euit the rock. The quicksilver is put in by the feeder at regular intervals, and it is the duty of the amalgamator to see that the right quantity is employed. The general rule is to put it in every half hour.

On the inside of the battery two platee of copper 4 or 5 inches wide extend ite whole length on both sides of the stamps and incliuiug at an angle of 45° towards them. Sometimes a strip of copper is tacked to the inside of the frame of the screen; upon these plates and upon the apron in front of the ecrcen—which is also covered with copper, most of the gold collecte. Some amalgam forms about the ehoes and dies, and pieces, generally of small size, get broken off from the plates and are found in the loose stuff when the "run" is finished.

Amalgam on the Plates.

The experienced amalgamator judges from the appearance of the apron whether the feeder ie using the proper quantity of mercury. He frequently washes the pulp from the copper plate on the apron and carefully examinee the appearance of the amalgam on its surface. It is a common saying that "there should he no fluid quicksilver outside of the battery, and still there should he." In other worde the mercury and gold should he made to equalize each other.

The more amalgam allowed to remain in the apron, the moro rapidly will the particles of gold and amalgam he arrested as they pass over its surface. The experienced amalgamator takes great pains to keep his plates just in the proper and most sensitive condition. When the gold is coarse, from 60 to 80 per cent remains in he battery. As a general rule, each ounce of gold per ton in the rock will require an ounce of mercury.

Preparing New Plates.

New plates are almalgamated by first ruhhing them bright with dilute nitric acid and eand. Thie ie washed off and the plate wet with a solution, made hy heating mercury and nitric acid together, the mercury being always in excess; that is to say there must always remaiu some mercury undissolved when the acid no longer acts upon it. The plates are then rubbed with metallic mercury and a strong solution of cyanide of potassium. This process must be repeated if necessary until the surface of the copper is perfectly amalgamated.

Cleaning Up.

When the intended run is completed the stamps are hung up and the battery screen removed. All the large fragments of rock are taken out by hand and thrown aside. In removing those of medium size they must he examined for lumps of amalgam, which, if found, are to be placed in a clean iron pan. The finer portion, consisting of quartz, particles of iron, amalgam, etc., must be placed in buckets for washing at the proper time. The shoes and dies must be removed and every part of the battery scraped down with some convenient iron tool. The copper plates must be scraped with a piece of stiff rubber belting or with a scraper made of copper. The amalgam is to he placed in the clean iron pan with the detached pieces from the battery. Frequently, if an insufficient quantity of mercury was used the amalgam on the inside plates ie so hard that it caunot be removed without using a cold chisel or eome other iron tool. In this case great care should be taken not to lacerate the copper. The outside plates must he scraped with the helting in the same manner, and the amalgam carefully transferred to the pan.

The washing of the fine battery stuff is done in an iron pau just as a pan of placer dirt is washed. There generally remains some dirty quicksilver, pieces of iron from the stamps, lumps of amalgam and hlack iron eand. The residue is washed out into some convenient vessel, and the operation continued until the whole of the contents of the bucket is so treated. It is then all replaced in the pan and a considerable quantity of quicksilver poured in with it. Most of the water is removed with a sponge, and a few lumps of cyanido of potassium are put in. When these are dissolved the whole is to he stirred with a etick for some time, after which a stream of water is turned on until all the cyanide is waehed away. The hande are then plunged in and the mercury allowed to pass through the fingers; any lumps of amalgam can be crushed and the fragments of iron or quartz removed. This subject will he continued in our next number.

Mining Dividends in 1871.

Tho following are the amounts disbursed ae dividends during the year 1871 hy some of the mining companies of California, Nevada, and Idaho, whose offices are located in this city:

The Amador (California) mine dishursed in April, $14,800; May, $9,250, and omitted dividends during the other months.

Chollar-Potosi disbursed duriug January, February, March, April, aud May $280,000 a month, June and July $56,000 each month; and in Auguet, September, October, November, and December, $28,000 per month.

Crown Point paid dividends only during the mouths of June, July, August, and September, and then $120,000 per mouth.

Eureka (California) January, February, March, April and May, $40,000 per month; June and July $20,000, and none during the remainder of the year.

Eureka Consolidated, February, $50,000; March, $37,500; April, $37,500; August, September, and Octoher, $50,000.

Golden Chariot (Idaho), January, $40,000; February, $60,000; March, $70,000.

Greenville (California), in June, $4,000.

Hale & Norcross, January, February, March, and April, $40,000 per month; omitted during remaining eight months.

Keystone Quartz, in September, $5,000; Novemher, $7,500; December, $7,500.

Meadow Valley, January, Febrnary, July, August, and Septemher, $60,000 per month; October, November, and Decemher, $90,000 per month.

North Star (California), January, February, March, aud April, $9,000 per month; June $12,000, and July $6,000.

Pioche paid a dividend of $20,000 in Septemher.

Raymond & Ely, March, April, June, July, and August $30,000; September, $45,000; October, $120,000; Novemher and Decemher $150,000 per month.

Redington Quicksilver, April, May, June, July, and August $6,300 per month.

Sierra Nevada, one dividend of $20,000 in January.

Succor Mill & M. Co. paid one of $11,400 in September.

Yellow Jacket, Jauuary, February, and March, $48,000 each month; April, May, June, July, and August $60,000 per month.

Yule Gravel, August and Septemher $5,000 per month; Octoher, $10,000; Novemher and December $5,000.

The yield for the different months from the above named mines sums up ae follows: January, $537,000; February, $587,000; March, $554,500; April, $517,600; May, $407,550; June, $308,300; July, $363,300; August, $359,300; Septemher, $344,400; October, $298,000; November, $280,500, December, $280,500, making a total of $4,837,950.

These dishursements compare with the amounts paid hy the eame and other mining incorporations for the previous year as follows:

	1870.	1871.
Amador	$115,400	$24,050
Argenta	21,000	.....
Chollar-Potosi	668,000	1,652,000
Crown Point	.....	480,000
Eureka	430,000	240,000
Eureka Consolidated	.....	275,000
Golden Chariot	75,000	170,000
Golden Rule	3,000	.....
Greenville	.....	4,000
Gould & Curry	48,000	.....
Halo & Norcross	504,000	160,000
Ida Elmore	20,000	.....
Kentuck	30,000	.....
Keystone	.....	20,000
Meadow Valley	150,000	570,000
Metropolitan Mill	10,000	.....
Nor b Star	16,500	66,000
Original Hidden Treasure	32,000	.....
Pioche	.....	20,000
Raymond & Ely	.....	615,000
Redington Quicksilver	.....	31,500
Sierra Nevada	37,500	20,000
Succor Mill	.....	11,400
Union	30,000	.....
Yellow Jacket	.....	444,000
Yule Gravel	.....	35,000
Wheeler	6,000	.....
Totals	$2,226,400	$4,837,950

Raymond and Ely Mine.

The annual meeting of the Raymond & Ely Mining Company was held last week, aud the folllowing Trustees elected: Alpheus Bull (President), W. H. Raymond, C. J. Brenham, L. A. Booth aud A. K. P. Harmon. Andrew J. Moulder was retained as Secretary and C. W. Lightner as Superintendent.

The Superintendent reports the production of the miuee for the year as follows: From the Vermilliou mine, 78 tons; Burk mine, 2,764 tons; Creole mine, 2,690 tons; Panaca mine, 6,708—making in all 12,240. There were 10,574 tons sent to the 20-stamp mill at Bullionvillo, and 1,707 tons on the dumps, exclusive of 125 tons second class ore and 200 tons base metal ore, the latter at the Burk mine. The total quantity worked was 10,373 tons, the grose yield from which wae $1,361,590, or an avorage of $131.27 per tou. All the minee were in good condition, aud there was at least enough ore above the 233-foot level to keep a 50-stamp mill running for three months. Before the expiration of that time, the 323-foot level will have heen opened, and from presont indications the ore there will exceed the level now beiug worked. The new 30-stamp mill, recently purchased at a cost of about $90,000, is almost ready, and when completed will be the finest in that eection. The Secretary's report shows the receipts to have been, $1,395,975.57, and disbursements $1,331,289.89 leaving a halance on hand of $64,680.68 as shown by the following:

THE RECEIPTS.

From bullion product	$1,361,628.78
From waterworks	569.10
Sale of supplies	2,517.96
Mill salaries	733.28
Superintendent's drafts advised, but not presented	30,521.45
Total	$1,395,975.57

DISBURSEMENTS.

Property and claims, water works and legal expenses	$124,148.67
Mining expenses	228,329.54
Improvement at mino	35,688.32
Milling expenses	115,532.87
Improvement at mill	31,643.91
New 30-stamp mill	89,482.60
Taxes on property and bullion	10,563.07
Dividends to stockholders	615,000.00
Discount on bullion yield	21,642.77
Miscellaneous	7,657.74
Total disbursements	$1,331,289.89
Cash on band	64,680.68
Total	$1,395,970.57

Dividends.

There are 30,000 shares in the company. The disbursements to stockholders have been as follows:

1871	Per share.	Total.
March	$1	$30,000
April	1	30,000
June	1	30,000
July	1	30,000
August	1	30,000
September	1½	45,000
October	4	120,000
November	5	150,000
December	5	150,000
Totals	$20½	$615,000

Nearly 45 per cent. of the bullion yield ($1,361,628.78) has been realized by tho stockholders. Parties who purchased their stock when the operations first began, less than a year ago, have received back their principal and still have their stock.

The Hydraulic Fire Extinguisher.

The trial of Parker and Cook's Hydraulic Fire Extingnisher was made last Saturday, in the presence of a large nnmber of spectators, in front of Hobbs and Gilmoro's three-story building on Beale St. The want of an apparatns by which the roofs of huildings conld be reached in case of fire has been long felt, and any improvement which would snpply the doficiency looked for with interest.

The apparatns in question is very simple in its constrnction. It consists of a series of iron tubes shutting into each other like the sections of a telescope. The whole thing, stands upright on a firm framework pedestal. The tubes when fully extended reach a hight of 47 feet. The first tube or that connected with the framework on the ground, is oight inches in diameter, the smallest—that which is the last projected—is four and a half inches in diameter; the intermediate ones gradually vary in size, according to the snbstanco of the tubo. A staging, or cradle, rests on the top of the fonrth section, for men to stand npon, which, when the sections aro not extended, rests on the end of the first section, and is reached hy an ingeniously contrived ladder, which, with the sections fully extended, reaches from the staging on the top to the gronnd. This cradle is also movablo. It can be tnrned around or moved at pleasure. As it is raised up, it runs parallel with the wall, but when the desired elevation is reached, it is turned, end to the wall, and run ont so as to rest on the roof or on the window-sill, forming a gangway by which oither can he reached without danger or risk of any kind. By this means the contrivance can be placed so as to secure the firemen from danger of falling signs, cornices, etc. For no matter how far the extingnisher is placed from the bnilding, the fact that the staging can be run to the roof, forming a gangway from the apparatus to the roof or window, allows either to he conveniently reached by the firemen.

The test on Saturday was very satisfactory. Two men went into the cradle, aud in less than 30 seconds they were raised to a hight of 45 feet. They ran out their staging and crossed to the roof. A No. 2 nozzel was attached to the cock at the top of the tuhing and a copious stream thrown from it. Descending, the men stopped at one of the windows, turned their staging and went into the room. To descend, an escape pipe is opened, and as the water p^urs out, the staging comes down. The apparatus weighs from 1,000 to 1,300 lhs., and can be easily hauled on a truck. It lacks the complicated machinery which all the other apparatus intended for this purpose possess, and is easily handled.

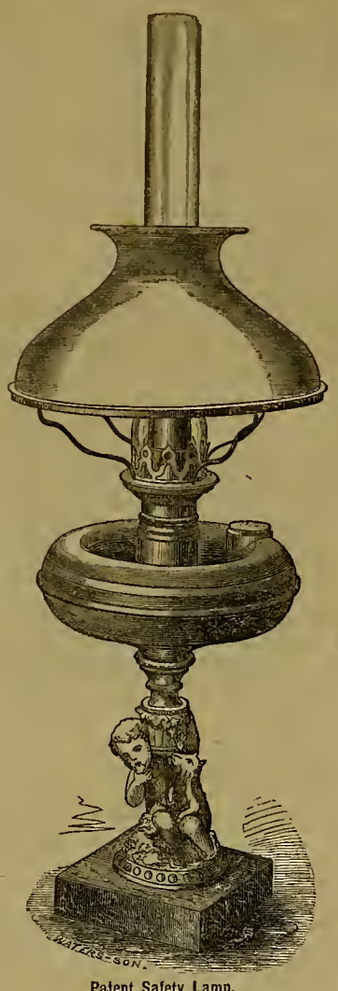
The apparatus is worked hy hydraulic power. A hose is fastened to the hydrant and attached to the base of the apparatus and the pressure forces the tubes upwards. The ordinary hydrant pressure of 50 pounds will force up a weight of 800 pounds. When the requisite hight is reached a faucet is turned and the water shut off, holding the apparatus in position. There is a cock at the top of the tuheing to which a hose is attached so that a heavy stream can he thrown without the necessity of having to haul up hose hy a ladder. When the water to supply this stream runs through the tuhing, it is held in position by cranks and wire ropes extending from the frame work to the top of the apparatus.

Another Line of Steamers.—In view of the proposed line of steamers for conveying ores to Europe, spoken of in another column, we learn by a telegram from Oregon, dated the 22 inst., that the representative of an English firm has lately heen in Portland for the purpose of making arrangements for another line of vessels between that place and England for ehipping spars and wheat.

The Quail Hill Mining & Water Co. are about introducing water into the deep gravel heds at Whisky Hill. The minos are said to be rich and a large yield is expected this spring. The principle owners in this mine are residents of Stockton.

Patent Safety Lamp.

The accompanying illnstrations represent the Bright-Union Safety Lamp, one which possesses considerahle merit, since it is the only one that has the burner connected with the tuhe separate and distinct from the reservoir containing the oil, and

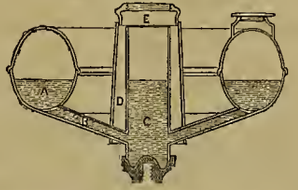


Patent Safety Lamp.

in case it should he upset, the oil will flow *from* the hurner and not come in contact with the flame. Most of the lamps in nse have the burner screwed direct on to

the fount, or oil tuhe containing the oil, there heing nothing in that case to prevent the accumulation of gas, and from that cause we hear of numherless accidents from explosions.

This lamp is constructed with two tuhes, as will he seen in the cut, the outside one,



D, intended only for the attachment of the burner, and the inside one, *C*, to contain oil and receivo wick. As there ie no eonnection hetween these tuhee, it will he evident that there can he no possibility of eommunicating any heat to the oil, and as long as the oil in a lamp can he kept perfectly cool, there is no chance for an explosiou. The tube to which the hurner is attached, *D*, is free from the oil tuhe, *C*, and a space for air, passing from the lower end, hetween the tuhe of the burner and the tube of the oil, keeps it always cool. The oil receptacle represented by *A* admits the oil through an opening in the top whenever it passes down throngh the tube *B* into the tube *C*. *E* represents the hurner.

When the burnor is attached to the lamp it will he seen that there is no opportunity for the oil to escape, should it be overturned, and in caso any accident should result, the worst consequenees that wonld occur would he the breaking of a chimney or shade. The patent for this invention was ohtained through the Scientific Press Patent Agency, by M. Samuels, and the lamps may be seen at Center & Bryant's, No. 10 Third street, in this city.

Notices of Recent Patents.

Among the patents recently obtained through Dewy & Co.'s Scientific Press American and Foreign Patent Agency, the following are worthy of mention:

Attachment for Planing Machines.—A. S. Hewlett, Sebastopol, Cal. This invention relates to a device which is called a chip-breaker, which is intended to he secured upon planing machines in such a manner as to press upon the hoard or stick which is heing planed, and prevent it from gouging or chipping up when the planing hits are cutting across or against the grain of the wood. It is intended to be used more particularly where the edges of hoards are to he planed to match each other, as in rustic and other similar work, and consists of a presser-foot with suitahly attached mechanism, so that it is caused to press on the wood just in front of the cutters in such a manner as to compel them to make a clean cut.

Car Coupling.—H. H. Morgan and A. Geary, San Francisco. This invention consists of au automatic coupling device and also of a euitahle mechanism for uncoupling the cars without the danger incurred hy going between them. Two humpers are secured to the ordinary car timhers, each consisting of two parallel stationary jaws, the outside one of each having a flaring extremity in order to guide the opposite or interlocking jaws when the care come together. After heing connected, the jaws are secured hy a piu passing through a slot which allows vertical motion. An arm is attached to a rotating shaft and connected to the pin, so that by rotating the shaft, the pin can he withdrawn. The upper end of the ehaft is hent at right angles so as to stand across the opening hetween the jaws, and a tripping har ie fixed to the upper corner of the entering jaw. This bar strikes the end of the shaft and draws the holt or pin, so as to allow the jaws to interlock, after which a spring throws the pin into place. The pin or holt is long enough to he withdrawn from the corner of the car without going between them, aud is held hack by a notch until the cars are nncoupled.

Nozzle. — Thomas Watson, Nevada, Cal. The ohject of this invention is to provide a nozzle or pipe principally for hydraulie gold washing, in which the difficulty encountered hy the twisting and spraying of the stream as it leaves the nozzle, is overcome without the use of the radial plates which are commonly employed. To do this the pipe is constructed with two conically shaped sections placed base to base within the length of the pipe, so that an enlarged chamher is formed, and within this the different currents are corrected and delivered from the nozzle straight and in a solid body.

Lamp Bracket or Support. — Henry Camphell, San Francisco, Cal. This invention consiste of a combination of etraight and curved arms, one being vertical and serving as a standard which fits into a socket in a table or sewing machine so that the outer end of the hracket may be turned ahout it over a considerable radius. The outer end of the hracket has a suitahle clamp for holding a lamp and this throws light on the work in various positions.

Bagatelle Game and Apparatus.—Wm. Evers, San Francisco, Cal. This invention relates to eertain improvements in the game of hagatelle, and the tahle used for the purpose, and consists in eonstrncting the table with a sheet-metal surface to prevent wear and present a smooth surface for the top to spin upon. Triangular boxes are constructed in the corners of the compartments of the table, and slides are held in these boxes so that if the top strikes a peg in front of the box the slide will be released and spring up so as to exhibit a number which counts for the player towards the game. The periphery of the top is made of an elastic snbstance to prevent injury to the sides of the tahle, and to cause the top to rehonud after striking.

Safety Lamp and Burner—Emil Boesch, San Francisco, Cal. This invention relates to an improved lamp, aud its object is first to so construct the wick-tube that by means of a movable ring the light is increased or diminished without changing the relative position of flame to the Argand chimney, which is used, and npon which relative position the efficiency of the light depends. It further consists in making the device a safety lamp hy means of certain connecting tubes, or channeled passages, which are so arranged that they convey any accumulation of gas or vapor from the body of the lamp to the hurner, where it is consumed. A novel arrangement is attached for suspending the lamp from the wall, or hracket, and also an improved adjustable reflector attached ahove the lamp.

Operating Railroad Switches.—E. A. Trapp, San Francisco, Cal. This invention relates to improvements on apparatus for throwing the switch rails of a railroad switch to any desired poiut by the approaching locomotive, previous to its arrival at the switch, and at the same time operating a signal which indicates the position of the switch or throw rails. The device is situated at some distance from the switch and is connected with a mechauism which is operated hy the passing locomotive or car, and in turn operates the worm gear and throw lever at the switch.

Mining Prospects.—The result of tho late rains are beginuing to show themselves among the mines iu an increase of product. From all quarters we hear predictions that the yield of the precious metals on the Pacific slope will he greater in 1872 than for the past five or six years. The amount of snow in the higher Sierras is large and its melting will suffice to fill the ditches until late in the summer. It will not be long hefore many of the placer claims now running night and day with large forces of men and an ahundance of water, will make their regular "clean ups" and business throughout the interior be heuefitted therehy.

We learn that in Nevada township more placer mines are heing worked, more men employed, and more water is used than ever before, and the *Transcript* thinks that more gold dust will be taken out than ever before in one season. At the more elevated mining towns in Nevada, Sierra and Plumas counties, the cold weather prevents mueh working, but in the tunnel camps the miners are all husy taking out gravel.

The past two years have heen so dry that our placer mines as a consequence did not yield anything like their usual amount of gold, but the prospect for active operations and a large quantity of "dust," is making all the miners wear smiling faces. The quartz miniug operations throughout the Coast are unusually active and prospects flattering.

The "Overland" for February.—The present number comes to hand full of good things, including a biographical sketch of the life of Joaquin Miller; Wine-making in California; The Commerce of Asia and Oceanica; The Palace and Tombs of the Czars, and a characteristic tale entitled "Spades."

Ballooning.—During the Siege of Paris, sixty-four balloons left the city—of this number five only were captured by the Prussiaus, two were lost at sea, and all the rest (57), were successful.

Dr. Kellogg delivered an interesting lecture on the Elements of Modern Civilization, last Saturday evening, hefore the College of Mechanic Arts.

Domestic Economy.

Animal Food.

A late number of the *Galaxy* has an article, by Dr. C. Draper, upon animal food for man. The Doctor does not agree with the vegetation philosophy. We do not know but the question of meat or no meat will be one of debate while the world stands. Concerning the influence of climate upon diet, Dr. Draper speaks as follows:

"Custom and religion have, it is true, a certain influence over the diet of a nation, but the habits of a people in this respect are, to a great extent, under the control of climate. The inhabitant of a torrid region delights in the fruits and succulent vegetables with which nature bountifully supplies him, and does not care to undergo the fatigue and exertion necessary to obtain animal food, when luscious fruit are ready to fall into his mouth. He lives surrounded by a warm, moist atmosphere, he does not require much heat-making food; the very air is enervating, and why should he exert himself when there is no necessity? The dwellers in arctic regions, on the contrary, must burn away rapidly in order to keep the temperature of his body at the point required to sustain the processes of life. Animal food therefore becomes the urgent requirement of his existence, and since fat furnishes the greatest amount of heat in a given bulk, he seeks greedily for the blubber of the seal or whale, and a glass of oil is to him far more desirable than the choicest wine of a Comet vintage.

"Between these extremes we find the inhabitant of the temperate zone, who, while he declines to partake of the grosser food of his northern neighbor, agrees with him in his craving for flesh of all kinds, and prizes especially venison and every species of game. At his table the fruits and vegetables of the southerner also have their place. He occupies the position that nature has intended for his race. He is an omniverous animal and with such a diet, and under favorable skies reaches the highest development of which his kind is capable. It is interesting to notice that when the system has become accustomed to a mixed diet, a total abstinence from either animal or vegetable food causes the disease known as scurvy. It is a popular error to suppose that this condition is the result only of a want of vegetable food. This error has arisen from the fact, that, heretofore, in long voyages, vegetable food has been deficient in quantity, but we now know that a species of scurvy may arise from a deficiency in the supply of animal food."

Hard and Soft Boiled Eggs.

It is understood that eggs are more easily digested if "rare" than "well" done; but which portion of the egg resists digestion —the "white," which is nearly pure albumen, or the yolk? Lately experiments have been made in this direction with ample opportunity of demonstrating that healthy gastric juice, which the stomach secretes for purposes of digestion, will not act readily on firmly coagulated white of egg, even if cut in pieces not larger than ordinary peas (and that is as fine as people usually chew their food!), while it acts with facility upon the more brittle yolk. The reason is that the coagulated albumen is very compact and tenacious, and would need to be "ground to powder" to accept the chemical affinities of the gastric juice.

Pour into a basin boiling water sufficient to cover the eggs, put the eggs into the water and let them remain 10 or 15 minutes, according to circumstances and your own taste; keep the water nearly up to boiling temperature, but don't boil the eggs. Fresh eggs will cook more quickly than old ones, and of course small ones quicker than large ones. By this process you will find the yolks well cooked, while the white is left in a condition to digest readily.

Moths.—In India, both upholsterers and saddlers badly troubled with moths in their work, especially in the rainy season; and the upholsterers in that country follow a series of simple rules by which they entirely avoid the ravages of these pests. They never put on a burlap or cotton covering without first steeping it in a solution of sulphate of copper, made by dissolving about one ounce in one gallon of boiling water, and then quickly drying the material in the sun or by a hot stove. For over coverings, especially if of wool, a solution of corrosive sublimate dissolved in patent colorless alcohol is frequently used with good effect. The boiling solution of sulphate of copper is often applied to a floor previous to laying a mat or carpet, and invariably under heavy articles of furniture.

Hollow Measure in the United States.

The following data with regard to measurements will oftentimes be found convenient for reference:

A barrel contains 40 gallons of 321 cubic inches, or 9,240 cubic inches.

The normal bushel is the Winchester; this ought to have the diameter in the clear of 18½ inches, to be 5 inches deep, and to have the capacity of 9.25x9.25x 3.1416x8, or about 2,150⅓ cubic inches.

A box 24 inches square and 16 inches deep has a capacity of 9,216 cubic inches, or nearly a barrel. A box 17¾x15x8 inches contains 2,130 cubic inches, or nearly a bushel. A box 14⅛x10x7½ inches contains 1,075 cubic inches, or exactly a half bushel.

A box 8x8x8 5-12 inches contains 538 cubic inches, or almost exactly a peck or quarter bushel. A box 7x8x4⅛ inches contains 231 cubic inches, or a gallon. A box 6x6x3¼ inches contains 117 cubic inches, or nearly a half gallon of 115½ cubic inches. A box 4x4x3¼ inches contains 56 cubic inches, or nearly a pint or quarter gallon (57¾ cubic inches.)

A New Use for Fresh Eggs.

Mr. John Murphy of this city—a gentleman of intelligence and close observation —recently made to us some interesting statements in regard to the value of fresh eggs in affording nourishment to weak animals, that are worth remembering by all farmers. He remarked that he had known a young colt which to all appearances was nearly dead, the breath of life being barely perceptible, to be quite instantly revived by giving it one or two fresh eggs. The same results, in several cases to which he was knowing, have followed the administering of eggs to weak calves, and also to feeble and chilled lambs. A remedy so simple, so easy at hand and so effectual in the cases mentioned—which often occur with calves and lambs—should be remembered by all our readers.

Cornstalk Syrup.—S. W. Bloom, of Broomstown, Ind., has made from common cornstalks a syrup superior in flavor to sorghum, though there was a sorghum flavor discernible. The yield is nearly equal, per acre, to that of sorghum, and does not interfere with the production of green corn for market, from the same stalk.

Mechanical Hints.

Fine Green Bronze.—First boil the work in a strong solution of potash to get off all the old lacquer and grease; next wash in clear water, after that let the work stand a day or two in a weak solution of nitric acid, then take out, wash, and dry; then coat the article with some good black lead. Polish until you have a good black glossy surface; then put on your yellow lacquer, which, put on a black surface, is your green bronze.

Waterproof Glue.—A glue that will resist both fire and water may be prepared by mixing a handful of quicklime with four ounces of linseed oil, thoroughly levigated, then boiled to a good thickness, and kept in the shade, on tin plates, to dry. It may be rendered fit for use by boiling it over a fire in the ordinary manner.

American Furniture Abroad.—During the week ending Dec. 12th, there was exported from the port of New York five cases of redwood to Stittin; two pianos and seven hundred and fifty fine packages of furniture, valued at $9,932, to Peru; eleven boxes of furniture and one hundred logs of maple to London; seven packages of furniture to the British West Indies; twenty-five logs of maple to Havre; twenty-nine packages of furniture, valued at $1,510 to Hayti; fourteen cases of furniture to Central America; eleven packages of furniture to New Grenada; three packages of furniture to Venezuela, and thirty-four packages of furniture to Brazil.

On the 14th of the same month, eight cases of furniture were shipped from New York to Constantinople; fifteen cases to Havana; nineteen packages of furniture to Poiut a Petre; one hundred cases of furuiture to Rio Janeiro; seven packages of furniture, one piano and eight cases of oil cloth to Vera Cruz.

On the 16th, one hundred cases of furniture, shipped from New York to Bombay, and ten hundred and sixty seven packages of furniture to Sydney.

JOHN TAYLOR & CO.,

IMPORTERS OF AND DEALERS IN

ASSAYERS' MATERIALS,

Chemical Apparatus and Chemicals,

Druggists' Glassware and Sundries,

PHOTOGRAPHIC GOODS, ETC.,

512 and 514 Washington street, SAN FRANCISCO.

We would call the special attention of Assayers, Chemists, Mining Companies, Milling Companies, Prospectors, etc., to our large and well adapted stock of

ASSAYERS' MATERIALS

—AND—

Chemical Apparatus,

Having been engaged in furnishing these supplies since the first discovery of mines on the Pacific Coast.

WE ENUMERATE IN PART:

Assay Balances—L. Oertlings, London.
Assay Balances—Becker & Sons, Antwerp.
Chemical Balances—Becker & Sons, Antwerp.
Ore or Pulp Balances—Becker & Sons, Antwerp.
Assay Weights—Grains and Grammes.
Bullion Balances and Weights.
Humid Assay Apparatus.
Iron Furnaces—Improved, Lined with Fire Brick for Cupelling and Melting.
Tongs, Muffles, Cupel Moulds, Assay Moulds, Scorifiers, Roasting Dishes, Annealing Cups, French Clay, Assay Crucibles, Hessian (or Sand) Crucibles.
Dixon's Celebrated Black Lead Crucibles and Covers—all sizes.
Assayers' and Chemical Glassware and Assayers' Hardware—a full assortment.
Steel Stamps for bars cut to order.

ACIDS AND CHEMICALS:

Acid in carboys and bottles, commercially and chemically pure.
Bi Carb. Soda, Borax, Bone Ashes, Litharge.
Assay Lead in bars, rolled and granulated.
Black Oxide Manganese, Sodium and Sodium Amalgam, Sulphate of Copper, Quicksilver, and all Chemicals and Reagents required by Assayers and Milling Co.'s.

☞ Our Gold and Silver Tables, showing the value per ounce Troy at different degrees of fineness, and valuable tables for computation of assays in Grains and Grammes, will be sent upon application.

24v23-tf JOHN TAYLOR & CO.

Varney's Patent Amalgamator.

These Machines Stand Unrivaled.

For rapidity pulverizing and amalgamating ores, they have no equal. No effort has been, or will be spared, to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the apperture and between tha grinding surfaces.—Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Setlers made on the same principle excel all others They bring the pulp so constantly and perfectly in contact with quicksilver, that tha particles are rapidly and completely absorbed.

Mill-men are invited to examine these pans and setlers for themselves, at the office, 229 Fremont Street, San Francisco.

GOLD-SAVING

Silver-Plated Amalgamating Plates

THE BEST PERIODICALS OF THE DAY.

THE GREAT

ENGLISH QUARTERLIES

AND

Blackwood's Edinburgh Magazine,

REPRINTED BY

The Leonard Scott Publishing Company, 140 Fulton Street, New York,

At about one-third the price of the originals.

THE EDINBURGH REVIEW,
THE WESTMINSTER REVIEW,
THE LONDON QUARTERLY REVIEW,
THE BRITISH QUARTERLY REVIEW,

Published Quarterly—January, April, July, October—

AND

Blackwood's Edinburgh Magazine,

(A fac-simile of the original). Published Monthly.

TERMS OF SUBSCRIPTION:

For any one Review	$4 00 per annum.
For any two Reviews	7 00 "
For any three Reviews	10 00 "
For any four Reviews	12 00 "
For Blackwood's Magazine	4 00 "
For Blackwood and one Review	7.00 "
For Blackwood and two Reviews	10 00 "
For Blackwood and three Reviews	13 00 "
For Blackwood and the four Reviews	15 00 "

Postage, two cents a number, to be prepaid by tha quarter at the office of delivery.

CLUBS.

A discount of 20 per cent. will be allowed to clubs of four or more persons. Thus: four copies of Blackwood or of one Review will be sent to *one address* for $12.80; four copies of the four Reviews and Blackwood for $48, and so on.

To clubs of ten or more, in addition to the above discount, a copy gratis will be allowed to the getter-up of the club.

PREMIUMS.

New subscribers for the year 1872 may have, without charge, the number for the last quarter of 1871 of such periodicals as they may subscribe for.

Or instead of the above, new subscribers to any two, three, or four of the above periodicals, may have, as premium, one of the 'Four Reviews' for 1871; subscribers to all five may have two of the 'Four Reviews' for 1871. Neither premiums to subscribers nor discount to clubs can be allowed unless the money is remitted direct to the publishers. No premiums can be given to clubs.

To secure premiums, it will be necessary to make early application, as the stock available for that purpose is limited.

Circulars with further particulars may be had on application.

The California Powder Works
No. 314 CALIFORNIA STREET,
SAN FRANCISCO.
Manufacturers and have constantly on hand
SPORTING,
MINING,
And BLASTING
POWDER,
Of SUPERIOR QUALITY, FRESH FROM THE MILLS. It being constantly received and transported into the interior, is delivered to the consumer within a few days of the time of its manufacture, and is in every way superior to any other Powder in Market.
We have been awarded successively
Three Gold Medals
By the MECHANICS' INSTITUTE and the STATE AGRICULTURAL SOCIETY for the superiority of our products over all others.
We also call attention to our
HERCULES POWDER,
Which combines all the force of other strong explosive now in use, and the lifting force of the BEST BLASTING POWDER, thus making it vastly superior to any other compound now in use.
A circular containing a full description of this Powder can be obtained on application to our Office.
16v20-3m JOHN F. LOHSE, Secretary.

H. & L. AXLE GREASE.
The attention of Teamsters, Contractors and others, is called to the very superior AXLE GREASE manufactured by
HUCKS & LAMBERT.
The experience of OVER TWENTY YEARS, specially devoted to the preparation of this article, has enabled the proprietors to effect a combination of lubricants calculated to
REDUCE THE FRICTION ON AXLES,
And thus Relieve the Draft of the Team.
Far beyond the reach of any who have but recently gone into the business; and as the H. & L. AXLE GREASE can be obtained by consumers AT AS LOW A RATE as any of the inferior compounds now being forced upon the market,
HUCKS & LAMBERT
Invite all who desire a First-class and Entirely Reliable Article, and which for Over 18 Years in this country has given such GENERAL SATISFACTION, to ask for the
H. & L. AXLE GREASE.
See that the brand H. & L. is on the red cover of the package, and take no other.

Mining Accidents.

A miner employed at Badger Hill, Nevada, fell from a flume on which he was at work, last week, and was instantly killed.

A man named Myers fell from a flume in Grizzly Cañon on the 16th inst., and was killed. Deceased was about 50 years of age.

John Sprague was badly injured in a claim on Iowa Hill by a cobble-stoue falling from the top of the bank and striking him on the head, fracturing his skull; his recovery is doubtful.

A Frenchman named Joseph Borchat, employed in Garland's Sulphuret Works in Lower Rat Gulch, Calaveras county, was severely injured by falling down a flight of stairs into the gulch below.

At the Creole Shaft of the Raymond & Ely Cos.' mines, says the *Ely Record*, on the eveniug of the 15th inst., an accident occurred, by which two men, Driscoll and Bradley, were severely iujured. A plank that was lowered into the miue got loose from the bucket and struck the shaft. When the bucket was raised again it loosened the plank which fell to the bottom of the shaft, striking two men, one of whom had his arm broken and hand badly injured. The other man sustained a compound fracture of the left thigh hone, and his hand also bruised and lacerated.

J. A. Davis, working in the Newton Booth mine, on the 10th inst., was injured in the head hy a piece of rock falling down the shaft. The bucket in passing up, struck the side of the shaft, dislodged the rock, which fell about 75 feet hefore striking Davis. He was stooping over at the time he received the hlow. The injuries, though painful, aro not of a dangerous character.

REDUCTION WORKS BURNED.—The Stewart Reduction Works at Georgetown, Col., were totally destroyed hy fire on the 16th inst. The fire is supposed to have originated from hot ore thrown from an Arey furnace on to the cooling floor. The loss is reported at $60,000 of which $20,000 is covered by insurance. These works were huilt in 1870 at a cost said to have beeu $150,000. They contained eight reverberatory furnaces, which were in daily operation until the beginniug of this year, when an Arey furnace was put in operation. The Denver *Tribune* says that arrangements had been completed for the construction of a Krom concentrator.

Three several reduction works have been destroyed by fire in Clear Creek County during the past year. There are but two mills now remaining—the German Reduction Works at Georgetown and the International Mill at East Argentine. The Stewart works treated ore containing from 50 to a 100 ounces of silver per ton—just the class which predominates at Georgetown, and to the people of that towu the loss is a severe calamity. It is, however, contemplated to rebuild them.

New Incorporations.

The following have filed certificates with the County Clerk, San Francisco.

CALIFORNIA FURNITURE MANUFACTURING CO.—Jan. 19. Object—To manufacture, import, buy and sell furniture and upholstery. Capital stock, $600,000 in 600 shares. Trustees: N. P. Cole, O. W. Merriam, E. Foster, J. P. Whitney and G. Whitney.

MURPHY M. Co.—Jan. 19. Object—To mine in Twin River District, Nye county, Nevada. Capital stock, $3,000,000 in 60,000 shares. Trustees: J. D. Hayne, H. Beachy, J. W. Gashwiler, T. Bell and J. A. Boalt.

KINGSTON M. Co.—Jan. 22. Objects—Mining and milling ores containing precious metals from certain veins, or lodes, of quartz rock in Ely Mining District, Lincoln county, Nevada. Capital stock, $1,000.000 in 30,000 shares. Trustees: W. J. Williams, L. W. Greenwell, M. Schmitt, G. D, Roberts and J. C. Maynard.

HUHN ANN HUNT SILVER M. Co.—Jan. 23. Object—Mining, etc., in Ely Mining District, Lincoln county, Nevada. Capital $3,000,000. Trustees: L. A. Booth, N. O. Fasset, G. D. Roberts, E, A. Head, E. B. Rail, E. Huhn and J. Clark.

PACIFIC LANCET PUBLICATION ASSOCIATION.—Jan. 23. Objects—Scientific purposes, and especially for the publishing of a medical and scientific serial. Trustees: W. F. Smith, W. T. Brodburg, C. M. Bates, H. H. Toland, R. Beverly Cole, A. A. O'Neil and E. Trenor.

Mr. J. S. Phillips's Book Reviewed by the Overland Monthly.

[Issued and sold by DEWEY & Co., SCIENTIFIC PRESS Office, San Francisco.]

The title-page to this volume sufficiently indicates its general scope and purpose. A work of this kiud has been much needed by those interested in mining on this coast. The author has performed his labor well, and, with the exceptiou of some minor imperfections of style, produced not ouly a well-arranged, aud somewhat original, but also a highly interesting and useful work. The book contains 640 octavo pages; illustrative of the several subjects treated—some of theso beiug original—and the wholo creditahle, as regards mechauical exccution. The first section of the work is devoted to a consideration of geology and mineralogy, wherein the author treats of the structure of the earth, tracing it from its initial chaotic state to the earliest appearance of its primitive mountains; the formation of its various rocks; the theory of earthquakes; its vein system, etc. Some of the ideas set forth in these chapters, though strikiugaud unique, are well sustained. Part secoud is devoted to the subject of exploration or "prospecting," giving directions how and where to carry on the busincss; pointiug out the most favorahle formation in which to seek for metalliferous veins, and the best methods of ascertaining their value, etc.—all of which cannot fail to be of great service to that class for whose use it was chiefly iutended. Section fourth is occupied with questious relating to mining and engineering—a hrauch in which our people have hcen especially deficient, and who must, therefore, be proportionately profited by what is here said. In this departmeut the author secms to be entirely at home, the whole suhject having been treated in a masterly and exhaustive manner; mechanical engineering, both above and below the surface, the hest style of engiue and machinery for hoisting, pumping, concontrating, crushiug, and for effectiug the various other operatious required, being ably handled. The last system is devoted to metallurgy; the various means and methods adopted iu the treatment of refractory ores, hoth iu their reductiou, and with a view to diminish their weight to insure cheaper conveyance to market, being ably discussed and intelligently disposed of.

This book, while well arranged and vigoronsly written, shows signs of haviug heen prepared iu haste; the style, as hefore remarked, leaving the impression on the reader's miud that the author had beeu, at times, greatly hurriod. His meaning is, nevertheless, always clear, and his language good Anglo-Saxon; while, so far as the mere graces of style are coucerned, it could hardly be expected that they would receive much attentiou in a book like this: we might almost say that any attempt at "fine writing" would be a blemish in a work of this kind. The man who has had to wrestle with pouderous machinery, who has passed his days amidst the hissing of steam and the pounding of engines, or down in the dripping alcoves of the mine, could have had but little leisure for the study of rhetoric, and few will complain that he has attempted to introduce so little of it into this volume. He has rendered to the leading industry of the coast a valuahle service—has furnished the mill-man and miner a safe and much-needed practical guide—having earned for himself, all things considered, the credit of producing one of the most useful works ever issued from the press of San Francisco.

THE Assembly has passed the bill for the relief of James W. Marshall, the discoverer of gold in California, giving him $200 per month for two years. It now goes to the Senate.

TWO OF the Japanese party are visitiug the mines of Grass Valley.

A Prospector's Manual.

EXPLORERS', MINERS' AND METALLURGISTS' COMPANION, comprising a practical exposition of the various departments of Exploration, Mining, Engineering, Assaying and Metallurgy. By J. S. Phillips, M. E. San Francisco. Dewey & Co., 1871. Volume I. 8vo., pp. 640. Mr. Phillips has written a hook that deserves the favor of the miners and prospectors of the Pacific slope. It is written with special reference to their wants, and contains much information in which they are generally deficient. * * * Of the 640 pages he devotes 99 to geology and mineralogy, 20 to prospecting, 230 to assaying, 140 to mining and engineering, and 150 to the main principles of metallurgy. This brief classification of the subjects of this volume serves only to give a general idea. Each branch is treated with clear style and full information. There are no words without ideas, and no ideas without practical value. Prospectors may imagine that they do not need to study books like this; but we tell them that those who prefer to remain ignorant will, in the course of a few years, be superseded by others who will learn a few fundamental principles. The book is free from trash, and solid throughout; all its matter is intelligible to men of ordinary education, and all of it is valuable to miners.—*Daily Alta, Dec. 24th.*

MARAVILLA COCOA.—No breakfast table is complete without this delicious beverage. The *Globe* says: "Various importers and manufacturers have attempted to attain a reputation for their prepared Cocoas, but we doubt whether any thorough success had been achieved until Messrs. Taylor Brothers discovered the extraordinary qualities of 'Maravilla' Cocoa. Adapting their perfect system of preparation to this finest of all species of the Theobroma, they have produced an article which supercedes every other Cocoa in the market. Entire solubility, a delicate aroma—and a rare concentration of the purest elements of nutrition, distinguish the Maravilla Cocoa above all others. For homœopaths and invalids we could not recommend a more agreeable or valuable beverage." Sold in packets only by all Grocers, of whom also may be had Taylor Brothers, Original Homœopathic Cocoa and Soluble Chocolate Steam Mills—Brick Lane, London. Export Ohioory Mills, Bruges, Belgium. f25-1y

Office, No. 420 Montgomery Street, (Room No. 1) 3d story, San Francisco, Cal.

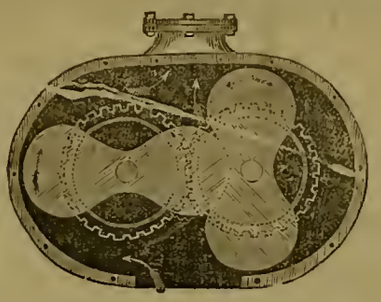
ROOT'S PATENT FORCE BLAST ROTARY BLOWER.

MANUFACTURED AT

The Globe Iron Works, Stockton, Cal.

AWARDED THE FIRST PREMIUM AT THE PARIS EXPOSITION—PATENTED NOV. I, 1864; JULY 24, 1866; AND OCT. 9, 1866.

Adapted for Smelting, Foundry, Mining and Steamships.



Requires 50 Per Cent. LESS POWER Than any Blower Now in Use.

One of these Blowers may be seen at W. T. Garratt & Co.'s Brass Foundry, San Francisco; Gould & Curry and Savage S. M. Co.'s, Nevada; and at C. P. R. R. Co.'s Works, Sacramento; and other places on this coast.

CAUTION.—Purchasers will find it to their advantage to apply direct to the Stockton Agency, as certain parties, not authorized to manufactnre the Blower, have put in the market machines of inferior construction, which do not answer all the requirements of the genuine article.

QUARTZ, SAW AND GRIST MILL, IRON, STATIONARY AND STEAMBOAT ENGINES, HORSE-POWER AND PUMPS, OF ALL SIZES.

For Circulars and further information, Address

4v24tf GLOBE IRON WORKS, STOCKTON, CAL.

TO QUARTZ MINERS AND MILLMEN.

Three years since we established in connection with our Crockery and Silver Plated Ware Business, a Factory for Silver Plating by electro process all wares which we had previously imported ready plated from Eastern factories.

Our enterprise, assisted by the liberal patronage of the Builders and Plumbers, has proven a success; and having subsequently added to our business that of SILVER PLATING COPPER PLATES for AMALGAMATING PURPOSES, we desire to inform the Miners and Millmen of California and Nevada, that we have recently perfected such improvements as to enable us to furnish at very short notice Silver-plated Amalgamating Plates, having a smoothness and finish of surface never before attained in California.

Orders for special sizes sent by mail will receive prompt attention. References from those who have used our Plates will be furnished to those desiring them

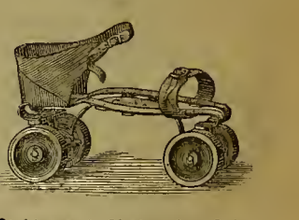
HAYNES & LAWTON,

Market St., under the Grand Hotel,

January 20, 1872. SAN FRANCISCO.

The C-Spring Roller Skate.

PATENTED 1871.



Rights and Skates for Sale.

This superior Skate is now beginning to attract the attention of Rink Owners, it being the only Cramping Skate now before the public (except the Plympton Skate) that can run without infringing a former patent.

This Skate is Positively no Infringement

Of anybody's patent. It is made in the most substantial and workmanlike manner, and possesses the following points of merit: Beauty, Elasticity, Ease of Movement, Strength, Lightness, and does not injure the skating floor as much as the ordinary skate.

Every pair Warranted to be just what it is represented. Parties intending to

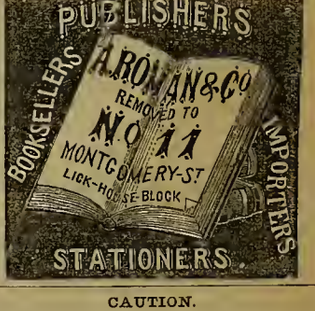
START A RINK,

Should examine and test this Skate. Sample pairs sent C. O. D. on application.

In ordinary samples state the number of boot or shoe worn, and whether for lady or gentleman.

☞ For City, County or Rink Rights, call on or address WIESTER & CO.,

No. 17 New Montgomery street (under Grand Hotel), SAN FRANCISCO.



CAUTION.

BETTS'S CAPSULE PATENTS

are being infringed by importation of Capsules made in contravention of his rights, which necessarily are numerous, BETTS being the original Inventor and Sole Maker in the United Kingdom.

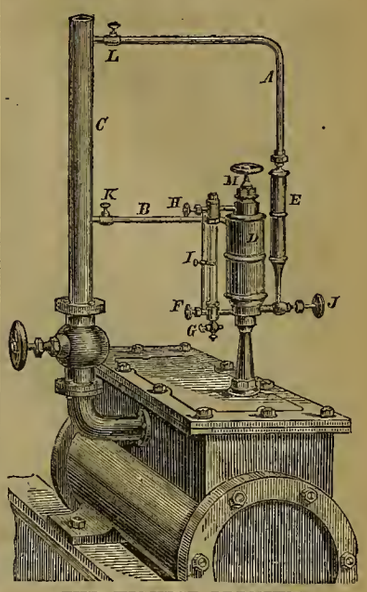
N. Seibert's Eureka Lubricators.



THE HIGHEST PREMIUM

Awarded by the Mechanics' Institute Fair, San Francisco, and State Fair, Sacramento, 1871.

These Lubricators are acknowledged by all engineers to he superior to any they have ever used; feed constantly by pressure of condensed water, supplied hy pipe A, regulated under the oil hy valve J, and forced out through check valve and pipe B into the steam pipe C; it theu becomes greasy steam, passes to all the valves and cylinder at every stroke of the engine; glass tube I indicates amount used per hour. Packing on rods and stems lasts longer, and the rings on the piston will not corrode. One pint of oil will last from three to six days, according to speed and size of engine; I, sliding gauge; K, valve to shut off when engine stopps; H, F, valves to shut off in case of frost; steam does not enter the cup; it is always cool; warranted to give satisfaction. Patented February 14, 1871. Manufactured by California Brass Works, 125 First street, S. F. 24v23tf

WHY THE WILSON
Patent Steam Stamp Mill

IS THE BEST AND

Most Desirable Mill for Crushing Ores.

Because the company give a responsible guarantee that the purchasers shall be under no expense for repairs for TWELVE MONTHS, and guarantee the mill to crush (regular work) One Ton Per Hour of the Hardest Quartz through the ordinary screens.

THERE IS A SAVING

of from Twenty to Forty per cent. running expenses.

To put one of the Wilson Mills over the mountains, from $10,000 to $18,000 is saved in First Cost.

The Wilson Mill will save in working expenses and repairs enough every six months to PAY FOR ITSELF.

IN EVERY PARTICULAR

This Mill is Greatly Superior to the

Ordinary Oam Stamp Mill.

RECOLLECT

This Mill is Fully Guaranteed

to do and be all we claim for it.

DO NOT BE DECEIVED

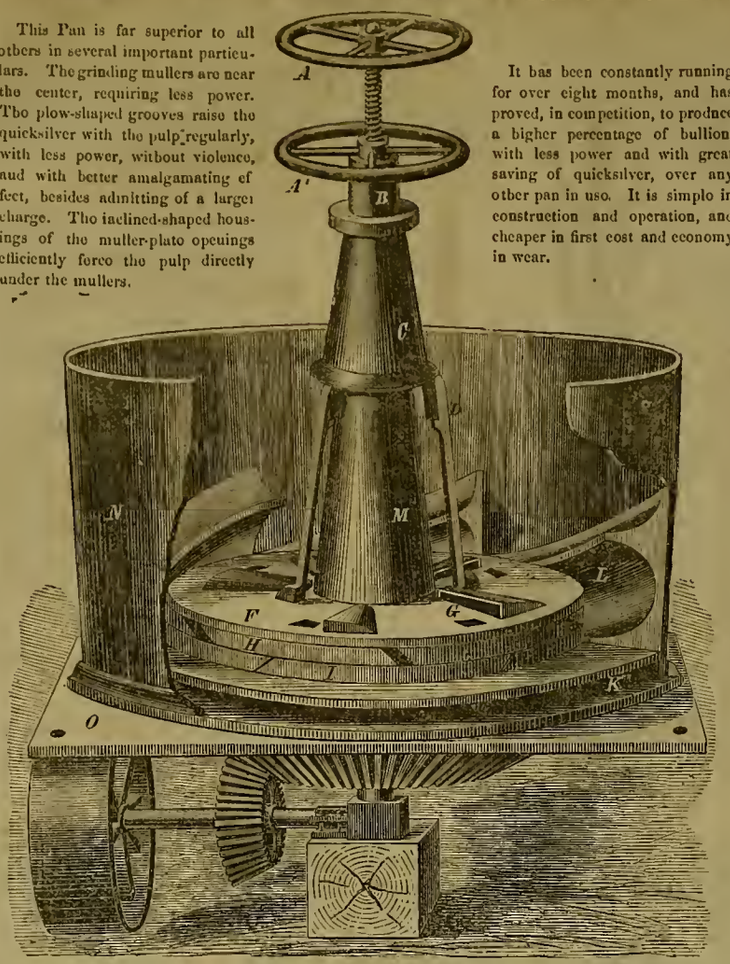
17v23-3m GODDARD & CO.

STEVENSON'S PATENT MOULD BOARD AMALGAMATING PAN.

This Pan is far superior to all others in several important particulars. The grinding mullers are near the center, requiring less power. The plow-shaped grooves raise the quicksilver with the pulp regularly, with less power, without violence, and with better amalgamating effect, besides admitting of a larger charge. The inclined-shaped housings of the muller-plate openings efficiently force the pulp directly under the mullers.

It has been constantly running for over eight months, and has proved, in competition, to produce a higher percentage of bullion, with less power and with great saving of quicksilver, over any other pan in use. It is simple in construction and operation, and cheaper in first cost and economy in wear.



Manufactured at the Golden State Iron Works (Co-operative). 19 First street, S. F.

Where it can be examined and further particulars be learned; or persons may apply to the inventor and patentee, Mr. C. C. STEVENSON, at the Douglas Mine, Gold Hill, State of Nevada, where the Pans have long been in coustant operatiou. 15v20-1mr,1amtf

HUGHES' PATENT

REMOVABLE GLOBE LANTERN.

Since the time when King Alfred made the first lantern by surrounding a candle with a transparent casing of horn, this class of appliances has been one of the greatest utility and most extended use. Among the latest improvements in its construction is that illustrated in the accompanying engravings, and designed to secure the threefold object of providing for the easy cleansing of the glass portion, the secure retention of the upper in place upon the lower part of the lantern, and the affixing of the hall to the top of the lantern in a durable and efficient manner. The base of the lantern is provided with the usual detachable lamp, and at one side has hinged to its upper edge a wire frame designed to carry and protect the glass portion or body of the lantern, and at the upper end of which is the cylindrical top, perforated in the ordinary manner to permit the escape of the products of combustion from the lamp. Arranged at that side of the base opposite the hinge is an angular spring-catch so applied as to catch over the annular lower rim in the wire frame, and, in conjunction with the hinge, to hold the said frame firmly of place upon the base as required when the lantern is in use.

This Lantern is offered as

The Best and Most Desirable in Use,

all things considered. Its price is reasonable, and when once tried no other will be accepted.

Individuals, Dealers, Railroad Companies, and all persons and institutions about to purchase Lanterns, should inquire for this kind; and if not for sale in your locality, address the inventor for circular of full description, price list, etc.

Patented August 10 and December 28, 1869, by

JOHN HUGHES.

AMBLER'S BLOWPIPE FURNACE,

For Roasting Rebellious Ores.

This new roasting furnace is the CHEAPEST AND BEST yet offered to the public. By furnishing an ample supply of oxygen to the ore while roasting, thorough oxydization of the sulphurets is secured at a small cost.

It is Adapted to All Kinds of Ores.

A description and illustration of this Furnace was given in the Scientific Press of November 25th.

For terms, circular, and further information, address the agent of the inventor,

MONROE THOMSON,

At 444 California street, San Francisco, until further notice. 25v23-3m

The Scientific Press,

Established in 1860, is now the Largest, Most Original, Best Illustrated and most Ably and Carefully Edited Practical Mining Journal on the Western Continent. Its contents are made up of fresh intelligence in a condensed and interesting style, easily appropriated by the reader, who finds its columns replete with new facts and ideas not obtainable in the books of the past or in any one other of the journals of the day.

Varied in its carefully compiled and conveniently arranged departments, representing the special and leading industries of the Pacific States—Mining, Mechanism, Manufacturing, Building, Improvements and Inventions—it becomes a weekly informant to all Scientific, Mechanical, Manufacturing and Industrial Progressionists on the coast, an immense list of whom testify to its pleasant, profitable and elevating influence.

The progress of our journal has been steady and unvarying. Encouraged by a liberal class of readers who exhibit their appreciation in a substantial way, we shall, with our increasing facilities, experience and information, make each coming issue superior to its predecessor.

Let every friend of Science and Industry on this side of the continent take pride, not only in sustaining, but accelerating the advancement of a faithful representative of its highest interests by subscribing for it and urging its patronage by others—now, without delay.

Subscription $4 a year, in advance. Address

OUR U. S. AND FOREIGN PATENT AGENCY presents many and important advantages as a Home Agency over all others by reasons of long establishment, great experience, thorough system, and intimate acquaintance with the subjects of inventions in our own community. All worthy inventions patented through our Agency will have the benefit of an illustration or a description in the SCIENTIFIC PRESS. We transact every branch of Patent business, and obtain Patents in *all civilized countries*. The large majority of U. S and Foreign Patents granted to inventors on the Pacific Coast have been obtained through our Agency. We can give the best and most *reliable* advice as to the patentability of new inventions. ADVICE AND CIRCULARS FREE. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior.

ENGRAVING ON WOOD, of every kind, for illustrating machinery, buildings, trade circulars, labels, plain or in colors, designed and cut in the best style of the art by experts in our own office. Also, engraving on metals.

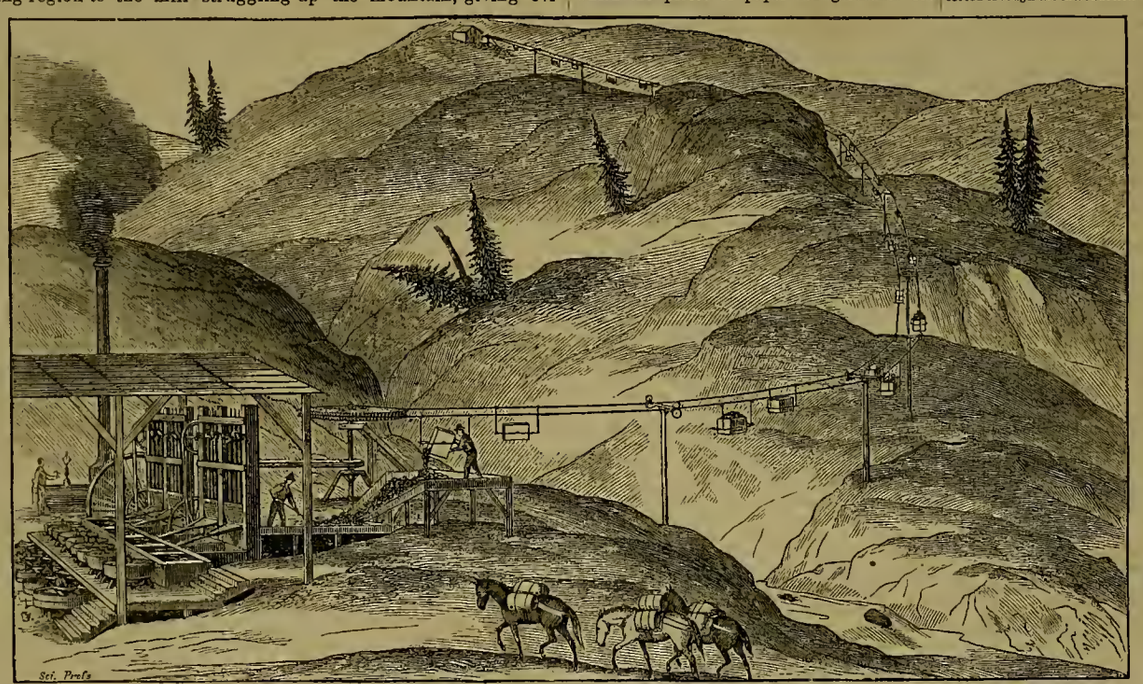
VOLUME XXIV. Number 5.

Hallidie's Wire Rope-Way.

In the SCIENTIFIC PRESS of February 18th, 1871, we gave a detailed description, with numerous engravings, of Hallidie's endless wire rope-way, which is intended for the rapid and economical transportation of ores, lumber or goods, over a rough country, as well as for the transmission of power from one point to another. The invention is one of great importance, especially to the miners of the Pacific slope. Our illustration gives a general view of the whole apparatus in practical operation conveying quartz from the top of a mountain in a rough mining region to the mill below. As will be seen, the wire rope passes over pulleys elevated upon posts of a suitable length, and as shown in the cut the sacks of ore are suspended by the proper device to the rope. The sacks or cars are loaded on the dump at the mine on the mountain, and the patent grip pulley being revolved by means of the engine, the sacks or cars pass down on one side, deliver their load, and pass up empty on the other side. Boxes may be used that are self-dumping, or operated by hand as desired. By this means the expense of road building, teams, drivers, etc., is done away with and a safe and very convenient method adopted by which the ore is delivered to the mill. Either sacks or cars may be used for carrying, as desired. The patent grip pulley is a very ingenious device and accomplishes its purpose admirably.

The rope-way may be run by the same engine that runs the stamps at the mill, and when the descent is sufficient and the load comes *down*, no extra power is needed, the gravity of the descending loads being sufficient to keep it in motion; it being desirable, however, in all cases to connect with the steam engine or water wheel in order to regulate the speed of the rope, which is usually about 200 feet per minute. The posts, of course, are arranged high enough so that the cars may be clear of all obstructions from the ground, but the undulations of the ground can be followed. There being a pulley over the rope as well as under it, keeps the rope between the pulleys and enables it to pass over any mountain at any angle. A brake is sometimes used to regulate the rapidity. One very great advantage possessed by this system of conveying ores, is that the weather will not affect it, for it can be worked during heavy storms and freshets and the depth of snow is of no consequence; moreover, it will run as well by night as day and with no more cars.

The advantages of this apparatus will be obvious at a single glance to any one familiar with the general rugged character of the Pacific slope, and our artist has succeeded in giving a very good view, easily comprehended. The familiar quartz mill with its pans, settlers, etc., the mine on the summit, the patient mules struggling up the mountain, giving evidence that even the mill is in a somewhat elevated position, the engine, engineer, feeders, and last, but not least, Mr. Hallidie's excellent device in operation. This apparatus should not be confounded with the rope-way of Hodgson's patent, which is now in operation at the Eberhardt and Aurora Company's mines in White Pine, as it is totally different in its construction.



A VIEW OF HALLIDIE'S WIRE ROPE-WAY FOR TRANSPORTING ORES.

THE JAPANESE EMBASSY.—The Japanese Embassy, Hon. Chas. E. DeLong, U. S. Minister to Japan, and C. W. Brooks, Japanese Consul, left this morning by way of Oakland *en route* for Washington. The whole party numbered 112. From Omaha they will go on the Chicago and Burlington R. R. line, and we learn from D. W. Hitchcock, the agent of that line in this city, that arrangements have been made to give them the use of one of the finest trains possible, consisting of the magnificent Pullman Hotel cars, this being the only Pacific line on which these cars are run. The desirable accommodation of these cars was, we presume, the reason which induced the members of the Embassy to take that favorite route.

Japanese Waterproof Paper.

We have just received from the editor of the *Anglo-American Times*, 127 Strand, London, an immense pamphlet, containing reports on the manufactures of paper in Japan. Presented to both Houses of Parliament by command of Her Majesty, etc., etc., 1871. Consul Lowder gives an account of the manufacture of paper in Japan from the Paper Mulberry with numerous colored illustrations, representing the whole process of manufacture. Also speaks of the Tororo, another plant, from the roots of which a fine quality of paper is made, warranted to wash; and an oil paper for rain-coats, etc., and the process for making the glue by which the pieces of paper for garments are joined; also a list of some thirty varieties of paper and the uses to which they are applied.

Consul Annesley gives a list of 54 varieties of paper and a description of the shrube Kaji, Makoso and Kajiso, and the methods employed in the manufacture of paper from their barks, and modes of cultivation. Whole pages are devoted to the different processes by which waterproof garments, handkerchiefs, hats, rain umbrellas, sun umbrellas, telescopes, maeke, lanterns, fans, hair-strings, purses, oil paper for wrapping eilks, etc., together making an interesting document, which, if read by our paper manufacturers may lead to inquiries that may result in the introduction of some of these paper-producing plants, and possibly some of the processes by which the Japanese make so many thin, useful and beautiful articles of every-day use from paper.

EXTRACTION OF METALLIC ANTIMONY.—A new method of obtaining metallic antimony from the ore is as follows: The ore is pulverized and treated in wooden vessels with hot hydrochloric acid. The antimony is precipitated from the solution by means of zinc or iron, and the precipitate washed, dried and melted in a crucible under a covering of charcoal dust.

[From the COMMERCIAL HERALD AND MARKET REVIEW.]

MINING REVIEW FOR 1871.

Disastrous Effects of a Two Years' Drought.

For the last two years mining, in common with all our other leading industries, has suffered terribly from the effects of the drought, which has prevailed with a severity, and to an extent, not before experienced on this coast. For the first time in our history it has seriously affected both the vein and placer mines of California, and even crippled production in all our other Pacific States and Territories. The drouth that occurred ten years before, though scarcely less rigorous, failed to diminish the yield of the precious metals to the same extent, as our miners were then just beginning to reap the first fruits of the rich and virgin placers of Eastern Oregon, Idaho and Montana, where the gold lay near the surface, and but little water was required. The limited rainfall of the past two years, however, has told upon the production of our great staple with disastrous effect: having nearly counteracted the gains that had been meantime effected through the introduction of more perfect machinery and improved process' aided by a valuable experience gained in the general conduct of the business and other beneficial results attained. Thus, the out-turn of bullion for the year 1870 did not exceed seventy or seventy-five millions, and for 1871 about $80,000,000; whereas, with the usual supply of water, the production should have been 10 or 15 per cent. greater.

After suffering from a drought so unprecedented for its stringency and long continuance, we have been visited by a season equally remarkable for its bountiful and almost superabundant rain-fall; the amount of precipitation for the past month having exceeded anything that has occurred within a like number of consecutive days for the last twenty years. Coming at an opportune moment, this copious outpouring has wrought a salutary change in the condition and prospects of the mining interest from one end of the country to the other. Being warm, as well as abundant, and coming in such timely installments as rendered them most effective for good, they have already afforded abundant water for starting up every branch of mining; creating activity, and bringing relief for the present, while insuring for us an extended period of future prosperity in this department of business. It frequently happens that these first storms result in snow upon the mountains, affording but little water till the month of March, or perhaps a later period in the spring. But this year they have made their advent in the form of heavy rains all over the foot hills and the lower slopes of the Sierras, where the principal mining districts are situated, only their higher ridges and summits being, as yet, covered with snow. As a consequence, the mountain streams have, for a month past, been running bank-full of water, with the reservoirs and ditches every where filled to overflowing. From this mildness of temperature results the further advantage, that the water used in washing acts with greater efficiency, while the miner performs his labor with much more ease and comfort than when the weather is cold and the water chilled almost to the freezing point.

Since the coming on of the rains, the greatest animation has pervaded the mining districts of California. The idle mills have been set in motion and kept incessantly running. The hydraulics have every where been started up and kept playing day and night, tearing down the auriferous banks, and relieving them of their precious contents. The rich gravel, taken from the drift claims during the summer, is being rapidly washed out, yielding the waiting and expectant miner a prolific harvest of gold. Rich localities, upon which water cannot be brought by artificial means, and which do not afford enough to be worked in ordinary seasons, now swarm with busy men, eager to avail themselves of the means afforded only at these long intervals for successful washing here, and through the aid of which they are generally enabled to realize large earnings while they last. Every old miner knows of "dry diggings" of this kind, to which he never fails to repair on the advent of a wet season earning often more at these places in a few weeks than he is able to do throughout the entire year besides.

Owing to there being an insufficiency of water for washing it at the time, a good deal of the gravel taken from the drift

claims during the summer, was kept on hand, awaiting the coming of the rain; many of the quartz miners, also, having accmulated considerablo quantitiee of ore at such times as they were unable to run their mills. So, too, bed-rock tunnels, where required, were run, and much other preliminary work done on their claims by the hydraulic miners, whereby very many of them had work in a state of forwardness, and their grounds every way in excellent order for effectual operations when the rains set in. As a result, heavy out-turns of gold will be realized from these several sources of production early in the season.

In consequence of the low stage of water prevailing the past two or three years, the tailings from many hydraulic claims had so accumulated in the gulches and canons, that serve as outlets for this waste material, that operations had become greatly impeded, and, in some instances, prevented altogether. With the floods resulting from the recent heavy rains, many of these tailings will be swept away, clearing out such channels, and relieving this class of claims from obstruction on this score for a long time to come. But for the occurrence of these periodical floods, to such an extent would these tailings gather in the course of a few years, that a large proportion of the hydraulic grounds in this State would be rendered valueless; it being difficult to see by what other means their removal could be accomplished.

Bullion Product for the Past Year.

As large quantities of the precious metals have, for some time past, been diverted from the channels through which they formerly sought this city, and been sent East by rail, it is no longer easy to compute, at this point, the annual yield of the entire coast with precision. This diversion has mostly taken place from Utah and Eastern Nevada, having consisted mainly of silver bullion. Gold dust and bars have also lately found their way East through new channels from Southern Arizona and Montana, thereby further increasing the difficulty of making these estimates with accuracy. Much silver has also escaped from the first-named localities in connection with the lead bars shipped to Eastern destinations, not to mention considerable quantities of high-grade argentiferous ores sent forward in that direction. But, notwithstanding, this partial diversion of products that once centred at San Francisco, we are able to estimate the yield of the past year with approximate exactness: there being reliable data to show that it could not have fallen much, if any, below $80,000,000. In some instances it has been placed at a much lower figure; but, if local authorities may be accepted as conclusive on this point, the above estimate is clearly within bounds, and even a great deal too low. For example, the Montana press found fault with us last year because we assigned for that Territory an annual production of but $14,000,000, whereas it was claimed to have reached $20,000,000—and this at the very time that statisticians, in other quarters, were reprimanding us for having already grossly over-stated the true amount!

But despite these discrepancies of opinion as relates to the past, we know from the well-ascertained yield of certain leading localities, that the aggregate production of the coast must have been large for the year just closed. Turning to a few of these, we find, for instance, that the bullion shipments from Virginia City and Gold Hill amounted for the year to $12,500,000, being the product of the Comstock mines alone, and which amount exceeded by $3,400,000 the out-turn of the previous year. From Austin there has been sent over two millions of dollars, being mostly the product of the mines in that vicinity, and all from the region generally designated the Reese River Country. From the White Pine District an equal if not greater amount has been shipped; while the Raymond & Ely, and other mines in the neighborhood, will have turned out nearly as much more. The Humboldt Country may be counted upon for a million; while the Eureka, Mineral Hill, Railroad, Columbus, and several other districts in that State will each be able to make a good report of their year's work, several of them being new contributors to the bullion product of Nevada, whose total production for the year will overrun $21,000,000. In Utah we have, also, a new and prolific ally, her rich and virgin mines having responded liberally to the means applied for their development. Looking to California, we find that while the lack of water has greatly crippled the productive energies of many of our mines, it has not prevented the more prominent localities from making a very fair showing for the year. Nevada County calls for a credit of seven millions, based on the gold extracted from her quartz and gravel mines during the past twelve months. Sierra and Yuba feel each entitled to half as much more, while Placer, Plumas, Amador, and Butte, with several other of our leading mining counties, have each turned out such an amount of bullion as will save the annual production of the State from falling greatly below the average of late years. From this cursory review of the field, it will be seen that our estimate, though it may seem large, in view of the dullness that has pervaded many localities, is not really excessive. The amount of treasure received during the year at San Francisco, through public channels, has, indeed, been much less; the entire sum transmitted through Wells, Fargo & Co.'s Express, including coin, being reported at $42,962,540. The receipts of this house reached $18,341,629 and $55,310,151 for the years 1870 and 1869 respectively, the coin receipts having been much larger for the latter than during the year 1871. During each of these years, a good deal of bullion was shipped directly East from Nevada, Utah, and Montana, the largest amount having gone that way during the year just ended. As regards the out-look for the future, and, more especially,

The Prospective Yield for the Incoming Year.

There can be no question but every thing wears a most cheering aspect, and that the product will prove to be unusually large. When we take into consideration the entire situation—the immense gains we have now made in the business of mining; the improved processes and machinery lately introduced, coupled with the great number of new reduction works erected, and the certainty of ample water supplies the approaching season, we find here an aggregate of recently accruing advantages that warrants us in predicting for the current year a yield of the precious metals equivalent to eighty-five or ninety millions of dollars; and should nothing transpire meantime to mar the present prospect, there would be little ground for surprise should the product reach a hundred millions by the end of the year.

Everywhere new ore-crushing mills have been erected, the most of them of large capacity, and nearly all capable of doing better work than the average of those before put up. Improved furnaces have been built for roasting the refractious ores, and a great number of smelting works constructed in the base-metal districts. In the ditches and reservoirs built in this State the past year, our water-supplying facilities have been increased fully twenty per cent., while capital, the most powerful auxiliary of all, has come to our assistance, with a freedom and readiness never before experienced—such aid having, in fact, never before been so fully deserved. With all these helps, and the many new discoveries being made and rich mines constantly developed, we fea confident, that, with no untoward turn of events, there will be gathered from the mineral regions west of the Rocky Mountains a hundred million dollars within the next twelve months.

Dividends, Profits, Etc.

With this free production, the profits arising from mining operations the past year have been correspondingly large, leading to liberal investment in stocks and properties of this kind, causing the latter to advance steadily, and, in some cases, with extreme rapidity. Many of the older mines, which had for a long time been worked with little or no profit, have been rescued from the assessment and restored to the dividend-paying roll. Others, which had never before contributed anything toward the cost of their development, have begun to yield pay-ore, and even afford in some cases handsome returns; while still another class, that had been struggling for years with an adverse fate, their stock depressed to mere nominal figures, have advanced many hundred per cent., and that without undue inflation, there being, to all appearances, a good margin for them to further appreciate on their merits. Several new mines, some of them only discovered, or at least brought to a productive condition, within the year, have already yielded large and profitable returns, sufficient, in some instances, to have reimbursed their purchase money, with cost of plant and other improvements. This has been the case with a number of mines in Nevada and Utah, while almost all the early locations on the Comstock Lode have so improved in appearance or actual ore production as to greatly enhance their value. The Crown Point and Belcher grounds, which, a little more than one year ago, could have been bought for less than one hundred thousand dollars, are now selling at rates that would eggregate more than three million dollars each. Nor are these rates at all extravagant, such large bodies of high-grade ore having been developed in these mines as fully warrant them. Already these companies are paying enormous dividends, and it is quite probable that their net profits will amount the current year to several millions.

Several other claims on the Comstock—such as the Yellow Jacket, Hale & Norcross, and Chollar—have also made large net earnings the past year, a state of affairs that they will, most likely, be able to maintain in the future. The Raymond and Ely, the Meadow Valley, Eureka Consolidated, in Nevada; several mines in Utah, and a number also in the Owyhee country, southwestern Idaho, have been advanced to dividend paying concerns, the first named just now heading the list for large and profitable production, though there is every reason to suppose some of the others may ultimately rival it in this respect. The gains made during the year in the Owyhee District amount to over one hundred per cent., the half-yearly shipments from that locality ending June 30, 1871, having reached over $600,000, against less than $240,000 for a like period the year before.

In California, we have had many hydraulic and drift claims paying immense dividends, the profits arising from the operations of these mines being generally large and sometimes enormous. A good proportion of our quartz mines have also afforded handsome revenues to owners the past year, though there is little doubt but their earnings, as well as those of every other class of mines in this State, will hereafter prove more satisfactory than they have done for the past two years.

The Comstock Lode.

As is the case in all capacious ore channels the pay chutes have, at different periods during the past twelve years, given out and come in at various points along the line of the Comstock Lode; nearly all the leading locations on it having, at one time or another, been in *bonanza*. First, we had, as large producers, the Ophir, Mexican, and Central, at the north end with several small claims at Gold Hill; large bodies of good ore being afterwards successively developed in the Gould & Curry, Chollar, Savage, and Hale & Norcross, and still later in the Yellow Jacket, Crown Point, Belcher and other grounds situate at the southern extremity, as the mass of pay ore gave out at the opposite end of the lode. Subsequently, the grounds of nearly all these companies became more or less impoverished, some of them losing their pay ore altogether. Recently, immense chimneys of rich ore have been opened up at great depths in several of these claims, those found in the Crown Point and Belcher surpassing in magnitude any thing ever before encountered on the Comstock range. The prospects are also improving, just now, in the Savage, Gould & Curry, and others of the older claims on the mother lode, which, with the great strikes made elsewhere, have steadily advanced the price of shares in all the companies located upon it, causing, even such grounds as have, under very extended and costly exploration, still remained barren, to greatly appreciate in value.

Thus, we have the Consolidated Virginia ground, made up of several early claims, covering in all some thousands of feet, lying between the chimney that formerly enriched the Ophir and adjacent grounds, and the Gould and Curry, and which for many years was considered worthless, now selling at prices that aggregate a very respectable sum. Yet no valuable deposits have been met with in this ground—the vein, though existing along its whole extent, having thus far proved nearly barren. And so, too, with the Imperial Company at Gold Hill, whose prospects were so desperate in July last that they shut down work, a move that was then considered almost equivalent to an abandonment of their mine, on which a costly system of prospecting had been carried forward without interruption for a series of years, the labor of this company constituting one of the most signal examples of perseverance yet exhibited in the history of mining exploration on this coast. A large and well-constructed shaft had been sunk here to a perpendicular depth of 1,300 feet, from the bottom of which drifts were run toward every point of the compass, with cross-drifts in all directions. From these excavations many winzes had been raised and shafts sunk, honey-combing their ground, without developing any pay-ore. As a consequence, the stock of the company dropped to a low figure. Under the influence of the strikes since made in the vicinity it has, however, rallied, and bids fair to reach a higher point than it has touched for a long time past, notwithstanding no new developments have been made in the mine, work having not yet been resumed upon it.

As the rich bonanza lately reached in the Crown Point and extending thence into the Belcher is not only rich but expands as followed up, giving to it an appearance of great permanency, and as there is such a general improvement along almost the entire length of the Comstock Lode, coupled with largely increased facilities and lessened cost for milling ore, there is no doubt but the product of that lode, which reached $12,500,000 last season will be much greater for the incoming year, many good judges estimating the latter as high as sixteen and even eighteen millions of dollars. That it will reach the first-named sum is very likely, nor is it at all improbable that it may equal and even surpass the latter.

All doubts and even speculations as to the Comstock being a true fissure and even one of the most masterly silver-bearing veins ever discovered, are now set at rest. Already it has been pursued to a depth of 1,300 feet at points separated by a linear space of more than one mile along it. At this depth it has been found strong and fertile, with a lateral expansion at many places of more than a hundred feet; the cross-cuts in the Crown Point and Belcher chimney having already attained that length without encountering the opposite walls of the ore channel.

The magnitude and productive capacity of the Comstock Lode become the more strikingly apparent when we consider a few of the more prominent facts connected with its past history. The total yield of this vein up to date, covering a period of active production of about ten years, amounts to something like $130,000,000, being a yearly average of $13,000,000.

The out-turn of some of the principal mines on this lode has been enormous. Twelve of them, up to the middle of August last, had produced, been assessed, and made dividends as follows:

	Bullion produced.	Dividends.	Assessments.	Price of Mines.
Ophir	$8,240,000 00	$1,324,400	$1,232,000	$420,000
Gould & Curry	15,555,232 24	3,826,800	833,000	494,000
Savage	14,437,456 43	4,288,000	468,000	592,000
H. & Norcross	4,485,475 12	1,598,000	690,000	800,000
Chollar	10,760,021 10	2,300,000	462,000	933,100
Imperial	5,074,584 95	1,067,500	490,000	200,000
Empire	2,629,339 94	513,600	90,000	36,000
Yellow Jacket	14,177,774 30	2,184,000	1,518,000	1,080,000
Kentuck	4,070,097 81	1,252,000	70,000	228,000
Crown Point	4,354,112 00	978,000	623,370	3,690,000
Belcher	1,570,370 00	.....	234,400	2,408,000
Overman	1,692,347 00	.....	724,288	76,800
Totals	$84,046,811 89	$19,900,300	$7,235,058	$10,857,900

Adding to the above sum the product of these mines since the middle of August, and that of all other claims on the Comstock range since they were first opened, we arrive at the grand total before named. The yield accredited to the Crown Point and the Belcher comes only down to the month of May, the end of their fiscal year, and does not cover their earnings and dividends for the following three months. From the foregoing it will be seen that these mines, deducting assessments from the amount of dividends declared, have paid the owners at the rate of about 20 per cent. per annum interest on their investments, calculating the value of those properties at the current market rates at the time this table was compiled.

Work Resumed and Old Districts Re-occupied.

With increased facilities for prosecuting work to a successful issue, suspended operations have been resumed on many mines and are now being carried forward with energy and very generally with good prospects for a final success; some of these delayed and even abandoned enterprises having already richly rewarded those venturing further expenditure on their account.

Among the more noted localities in this category, we have the mines at Copperopolis, where operations, after having been suspended for a number of years, have lately been recommenced, the prospect of soon enjoying railroad facilities for transporting the ore to market having been the principal cause moving to this course. In Hope Valley, the Rodger's Copper Mine is also being re-worked, after a long season of rest. About Virginia City, a number of mines, including the Lady Bryan and others once enjoying considerable notoriety, have recently been reopened and show good breasts of ore. In California, and, in fact, throughout all parts of the mining regions, this process of resumption and re-location has been going on, indicating a more stable condition of society and a growing confidence in this class of claims. In some sections of Nevada, districts which a few years ago were nearly deserted, have again become quite populous; the miners who first inhabited them having, after trying their luck elsewhere, come back and settled down, satisfied with the chances in these abandoned places.

In this connection, it is worthy of observation that some of the best districts in Utah and Nevada, as well as in Arizona, were thus run over and hastily left in the early day, and that several of the most prolific mines in California have in like manner been for years neglected and all but abandoned, because of some unfavorable turn in the ore or other incident having little to do with their actual merits. Thus the Alison Ranch property, which had been suffered to go into a decline and for a long time stand idle, was at once resuscitated and restored almost to its pristine state, under a more prudent and vigorous administration. But a few months ago, the famous Eureka mine, near Grass Valley, suffered an eclipse that would have caused a timid and irresolute owner to have forsaken it as worthless. Persistent exploration has revealed at greater depths a new body of ore which, though not yet equal to that lost above, has saved this property from dropping into the abyss of abandoned claims, and has even given ground to hope that it may yet take rank among our most valuable mines. With these facts before us, there is every reason for believing that the Southby and other well-developed and once noted quartz lodes in this State, upon which, for reasons not bearing on their actual merits, little or nothing has for a long time been done, would, upon their restoration to a working State, prove properties of large and permanent value.

In these and similar incidents, we have lessons that should teach our miners greater patience and restrain them from hastily abandoning a mine or leaving a locality because every thing does not at first glance seem auspicious.

Among the more encouraging events, and

Noted Occurrences of the Year,

We have to report the discovery of many promising lodes and ore deposits in eastern Nevada and portions of Utah Territory, drawing into those sections of country a considerable population and greatly stimulating mining enterprise in that quarter. Considerable money has been expended in the purchase of mining properties in that region, though the more experienced and cautious class of operators have been restrained from investing freely on account of the eccentric and uncertain character of the deposits there, few of them being lodged in regular fissures. Owing to this treacherous feature of these mines, capitalists—more especially Californians and those abroad in seeking a field for permanent investment—have given a preference to the quartz lodes and gravel mines of this State, into which large sums of money have been put the past summer; the freedom with which capital has been expended in this behalf constituting another marked feature of the year just closed. A large proportion of the funds thus expended has been on account of foreign—mostly English—investors; and while it would be difficult to determine exactly how much has been drawn from that quarter the past year, the aggregate sum has no doubt amounted to a very large figure—not less, perhaps, than three or four million dollars cash for the entire coast.

Generally these investments have been fortunate, and are likely to prove satisfactory to those making them; though there have been a few exceptions to this rule, the most of these latter occurring in the State of Nevada. It has also happened in a few cases that English parties have had to pay, if not an exorbitant price for their mines, at least a most extortionate fee for the services of "middle-men," some of those parties buying shares in these Nevada mines on the London market having furthermore suffered from purchasing the same after they had been unduly inflated.

We incline to the opinion that our British friends will find they have made their best ventures in the gravel mines of California, both as regards safety and profit. In this department they have, so far as our knowledge extends, uniformly done well, having gotten hold of some of the choicest properties of this kind ever yet opened in the State.

List of American Mines owned by English Companies.

The following is a list of the mines on this coast, including Colorado Territory, owned abroad and chiefly by English capitalists, as we find the same quoted in the stock schedule of the *London Mining Journal*, December 16th, 1871. To designate the respective localities of these mines, we have employed the following symbols: Those located in California are followed by an *; Nevada, by †; Utah, by ‡; Colorado, by ¶. We have also reduced, as near as may be, to dollars the English pound sterling, used in the *Journal*, for expressing the prices paid for stocks, amount of capital invested, etc.:

NAME OF COMPANY.	Number shares.	Price paid per share.	Last price paid.	Nominal amount of capital.
Colorado Terrible ¶	21,000	$25 00	$23 75	$525,000
Eberhardt & Aurora †	23,500	50 00	75 00	1,175,000
Sierra Buttes *	112,500	10 00	27 50	1,125,000
South Aurora †	60,000	25 00	11 25	1,500,000
Sweetland Creek *	15,000	20 00	16 25	300,000
Bird's-eye Creek *	15,000	20 00	21 25	300,000
Champion ¶	7,500	50 00	.....	375,000
Olifton ¶	6,000	15 00	.....	90,000
Eclipse *	100,000	5 00	5 25	500,000
Emma †	50,000	100 00	116 25	5,000,000
Exchequer *	60,000	5 00	.....	300,000
Flag-staff †	30,000	10 00	20 00	300,000
Great Western †	6,000	11 25	.....	75,000
Illinois ¶	12,400	20 00	.....	310,000
IXL *	20,000	20 00	.....	500,000
Kansas ¶	11,000	20 00	31 25	275,000
Mineral Hill †	30,000	50 00	90 00	1,500,000
Pacific †	15,000	35 00	21 25	525,000
Pinto †	26,000	25 00	.....	650,000
Richmond †	44,000	25 00	41 25	1,100,000
Silver Star †	150,000	50 00	.....	7,500,000
Snowdrift ¶	37,500	1 00	.....	37,500
South Utah ‡	13,000	25 00	.....	325,000
Tuolumne *	40,000	10 00	.....	400,000
Utah ‡	10,000	50 00	41 25	500,00

This list sums up a total of nominal capital equivalent to $25,187,500. In looking it over, we see the Silver Star Company accredited to Nevada. We do not remember of any company having been organized to buy or operate mines under any such name in that State, and incline to the belief that there is a mistake, both as to the locality and the amount of capital assigned to that company. There was a group of Utah mines, one of them named the "Silver Star," sold to an English Company not long since for $450,000, and it is possible that this transaction may be here referred to; but whether this be so or not, there is no doubt some mistake as to the amount of capital set down in this list. Wherefore, though ignorant of the actual facts in the case, we may as well deduct from the above total a sum of at least seven million dollars, reducing it to $18,187,500. Of this amount, perhaps one-fourth or a little less has been paid in cash to the original owners, who have besides, in many cases, received a large number of shares in the new companies. In addition to this, a million dollars, and perhaps more, has been paid or provided for by the purchasers for working capital.

The following mines, not included in the above list, have also been sold to English companies during the past year, viz: The Silver Cloud, Camp Floyd District, Utah Territory, for the sum of $350,000: the Independence, California, for $200,000; the North America (drift gravel claim), Sierra County, Cal., organized with a capital of $400,000, $50,000 of which is for working purposes; the Dunderberg (silver), Mono County, Cal., for $150,000; the Ferguson (quartz), Mariposa County, Cal., $100,000; the Schenectady Mine, in connection with several other lodes, situate in Arizona, for $100,000. These are all proven, and the most of them largely productive properties, and have probably been bought at reasonable figures. The present owners of the Silver Cloud are said to have been offered nearly one hundred per cent. more for that mine than they gave for it; while the North America claim could not to-day be bought for twice the sum for which it was bonded eight months ago. The Ferguson Mine is also said to have appreciated nearly one hundred per cent. within the past four or five months. Adding these sums to the above amount, and we have a nominal of capital of over twenty million dollars invested in our mines on English account, of which nearly one-third, including working capital, has been paid in cash.

Besides these absolute sales, a good many of our mines are being negotiated on the London market. In this category, rumor places the Redington Quicksilver Mine, for $1,100,000; the North Bloomfield Hydraulic mines, at something over a million dollars; the Dardanelles (drift and hydraulic), at $500,000, not to mention a number of others being treated for, and some of which will, no doubt, be disposed of at an early day.

In recurring to the foregoing list, it may be observed that the shares of nearly all these companies are set down thereon as being fully paid. But five of the entire number are accredited with having as yet paid any dividends. These are the Sweetland Creek, which has declared a dividend of £1 4s to the share; the Eberhardt & Aurora, £1; the South Aurora, 12s 2d; the Colorado Terrible, 8s; and the Sierra Buttes, 6s. Notwithstanding this meagre showing of dividends, the shares of many of these companies have appreciated largely; some of them over one hundred per cent., as will be seen by referring to the list. In some cases, they are not so high now as they were a few months ago, the shares of several of these companies having suffered a decline ranging from twenty to sixty per cent., partly in consequence of unfavorable reports from the mines, but chiefly because they had been run up to extravagant prices under a speculative feeling. That they still enjoy, to a great degree, the confidence of financial circles abroad is shown by the figures at which many of them continue to be quoted; nor can it be said that the rates ruling are excessive, the dividends as yet declared being no criterion of their value. Thus far the most of these companies have been obliged to use the earnings of their mines for the erection of reduction works, the purchase of supplies, the construction of roads, and other needed improvements, and sometimes also for the more thorough exploration of the mines themselves. With these preliminary labors completed, earnings will begin to accumulate and dividends in due time ensue.

The Experience of English Companies at White Pine.

In so far as the English public may have had recent cause for complaint, on account of losses sustained through mining operations, it has been mainly due to advances effected in the prices of American mining stocks through illegitimate means employed by their home financiers. As a general thing, the losses sustained by people abroad, through this class of investments, have been attributable to the manipulations of parties in London, rather than to any fault in the mines themselves, or any mistakes committed by the experts chosen to inquire into and report upon their merits, or

yet of those to whose management they have afterward been committed.

The most serious disappointments occurring, of this kind, have grown out of the purchase of shares in certain companies owning in, and operating, mines at White Pine. Having been able to make a fair showing, and to declare liberal dividends for a few months at the start, the stock of these companies appreciated rapidly in the London market, advancing, on their par value, several hundred per cent. in a short time; buyers not stopping to inquire whether these results were based on developments indicating a likelihood of their continuance, or whether they were merely accidental, or due, perhaps, to special efforts directed to that end.

Having reached extreme figures, these stocks soon after began to decline. Evil tidings came from the mines; the ore bodies, in the lower levels, began to show signs of exhaustion, having, in some cases, been already wholly depleted; while neither vertical nor lateral exploration always lead to such new deposits as served to sustain former rates of production. The average grade of millable ore also ran somewhat lower than at first. Certain of the newly-erected mills were found to be at fault; break-downs occurred, and some portions of the machinery proved defective; the water supply, guaranteed by the vendors to be unfailing and abundant, proved insufficient; the tramway built, at a heavy expenditure, in the hope that it would greatly reduce the cost of transporting the ore from the mines to the mills, failed to perform that service effectively; wherefore the outturn of bullion fell off; dividends ceased, and shares went down, falling, in some cases, 40 or 50 per cent., and, in others, almost to par, causing consternation among the shareholders generally, and entailing heavy loss on such as had purchased largely on a too buoyant market.

To add to the dismay of our English friends, in this unhappy conjunction of circumstances, an eminent mining engineer, engaged, about this time, in making an examination of certain properties in that vicinity, having been invoked for an opinion as to the apparent value of the mines of these companies, expressed some doubts on the score of their probable permanence at greater depths, and the consequent chances of long-continued ore supplies, or, as he laconically stated the case, while he considered that further prospecting should be done on these mines, he did not believe very large sums should be paid for the privilege of carrying it on.

And so these stocks have since remained depressed, notwithstanding a correction, meantime, of some of these mistakes and errors, the partial removal of others, and a marked improvement in the condition and prospects of some of the mines. In several of the claims belonging to the Eberhardt and North Aurora Company, fine bodies of ore have lately been met with, while, in the South Aurora, systematic exploration is being pushed with energy, a tunnel now being in course of excavation designed to open it up to greater depths, and with a good chance of developing new masses of ore.

This has, from the first, been one of the most largely productive and promising mines on Treasure Hill; and it seems hardly possible, that an ore channel so vast, should, though marked by some irregularities, the results, probably, of surface disturbance, fail in persistence in depth, or soon become wholly exhausted of its mineral contents. Should, however, the productive energies of this mine become seriously impaired, the vendors would, through their generous conduct in donating so large a sum toward defraying the expense of further exploration, command the hearty sympathy of the mining public, as they have always been entitled to respect for their fair and honorable course in negotiating the sale of this property.

That the quantities of ore at command in the mines on Treasure Hill will always greatly fluctuate, unless exploration be kept well in advance of extraction, may be expected, as the ore channels here, while large and fertile, have shown themselves to be of an extremely eccentric character. That the mills here need, with proper precaution, never be in short supply of ores, and that the latter will never wholly fail, are opinions entertained in very authoritative quarters. It is generally believed, however, that the past experience of this locality may be accepted as foreshadowing that to come—results will probably continue fluctuating and uneven, large masses of high-grade ore alternating with barren spaces of considerable extent, imparting, as heretofore, to the operations carried on, a hopeful, but, at the same time, a somewhat fitful and hazardous character.

English Investments Elsewhere on this Coast.

But whatever the mistakes made at White Pine, and however the investments of British capitalists may finally result in that district, they have, undoubtedly, fared better, and, in fact, almost invariably done well, in their recent investments elsewhere on this Coast. Look where we will, and we find that they have become, in almost every important district, partial owners in, or the sole proprietors of, some of the best mines there. In the Reese River country, in the Eureka, Pinto, Mineral Hill, Troy, and several other promising districts in Central Nevada, at a number of points in Utah, in southern Idaho, and in other mineral regions of California, they have become proprietors, partial or exclusive, of many of the most valuable mines yet found in those localities; these parties having generally confined their purchases to well-proven and actively-productive properties.

Going to the extreme southern portion of the metalliferous range in this State, and passing to its terminus, three hundred miles north, we find Englishmen owning and operating mines in every county throughout this entire distance. In Mayo, they own the Kellup—probably the best mine, and including mill, water privilege, tramway, and other improvements, by far the best developed, well-conducted, and valuable property in that section of country. Already forty stamps are in operation there, with fifty more soon to be added—to which the Ferguson Mine, lately sold to English parties, is opening auspiciously, indicating that they obtained it at a figure greatly within its real value. In Tuolumne, Calaveras, Amador, El Dorado, and Placer, we find further fortunate purchases made on London account, and embracing both quartz and gravel mining properties. In Nevada County, several such sales have been effected, with negotiations for others, promising to lure in still greater advantage to purchasers, still pending. In buying the Birdseye and Sweetland Creek hydraulic gravel mines, our English brethren have done well, as will soon be demonstrated, now that the embargo so long placed on their productive capacities by the drought has been removed. The same will prove true, and perhaps in a more eminent degree, of the North America group of gravel mines, also recently transferred to English parties. And so we might proceed, including in our list the Sierra Buttes and many other mines, until we had swelled it to much greater proportions; the instances already enumerated being sufficient to indicate the general character of the properties heretofore passed over to the proprietorship of foreign investors.

In this connection, it may be pertinent to supplement the able replies of Ross Browne and others to the inquiry "Why our mine-owners, having such good properties, are so willing to part with them?" by the further remark, that, under our liberal laws regulating the location and holding of mines, a single individual may, and, in fact, frequently does, become the owner of a great many properties of this kind; and that, very often, without having the means to develop or make any of them practically available. Hence his desire to part with a portion of his interests, that we may realize some ready cash, and be enabled, if he desire, to improve the remainder. Nearly every miner, though a laboring man, is the owner of a claim of some kind; and, if he sells it, knows just where he can go and take up another—a knowledge that the capitalist does not always possess, nor, if he did, could he readily turn it to practical account. The other reasons that might be assigned, in answer to the above inquiry, have already been so well stated, that they need not be repeated here.

Our General Progress the Past Year.

In further considering the progress made in the department of mining and its collateral pursuits the past year, it may be observed, that the business of prospecting has been very extensively and actively engaged in, leading to the discovery of new districts in all parts of the country, and the location of many additional and some very valuable mines. The principal field of these exertions and fortunate results has been central Utah and eastern Nevada; though we have had some discoveries of this kind to record in this State, with a creditable progress made also in other and more remote sections of the interior.

MECHANICAL PROGRESS.

Burnt Iron and Burnt Steel.

An English chemist, says the *Yale Courant*, W. Mattieu Williams, has recently made a series of experiments to ascertain the condition which is induced in iron and steel by overheating, and which is technically called "burning." Burnt iron is brittle, has a short fracture, is crystalline, and is devoid of the fibrous structure and silky lustre of good iron. Mr. Williams finds that iron in this condition contains, diffused through it, small particles of black oxide. Hence, to test the question, often important in practice, whether a given sample of iron is burnt, he places about a decigram in a test-tube, and pours upon it three cubic centimeters of nitric acid of sp. gr. 1.20. If the iron is burnt, these particles of black oxide are at first left undissolved, and, appearing in the liquid, render it dark and turbid. Their subsequent solution distinguishes them from the carbon which may also be present in the sample.

Mr. Williams believes that the function of the small quantity of carbon always contained in good wrought iron is to prevent this burning. When this carbon is removed, the iron partially oxidizes throughout as soon as heated, and becomes "burnt." Hence the impossibility of making merchantable iron by the Bessemer process, the iron, at this high temperature, beginning to oxidize even when the carbon present is as much as 0.25 per cent. The Bessemer product is steel therefore, and contains 0.28 per cent. of carbon.

Iron has its maximum toughness when the carbon is lowest. The skill of the blacksmith is shown therefore in exactly touching, in his work, the point at which the oxidation of the carbon ceases and that of the iron begins, without passing it; thus attaining the best result.

Steel, on the other hand, when "burnt," is brittle, can no longer be tempered, and cannot be used until it has been raised to a welding heat, rolled or hammered, and gradually cooled. Its fracture is coarse and granular, the facets of the granules being conchoidal, by which the burnt condition may often be practically distinguished. Mr. W. finds that when steel is heated, the carbon in it rapidly oxidizes, even throughout the mass. He explains "burnt" steel to be steel in which, by suddenly solidifying it when in a viscous condition, carbonic oxide evolved by the oxidation of carbon, is imprisoned. By slower cooling this carbonic oxide would have been expelled; hence the cavities or "toad's eyes" in the steel; which may be removed by welding, which operation, as above stated, restores the steel.

"Burnt iron" and "burnt steel," therefore, both owe their rottenness to intermingled particles of combustion-products; coming in the latter case, from the carbon; and in the former, from the iron itself.

NEW INSTRUMENT FOR MEASURING SPEED AT SEA.—The difficulties hitherto experienced in measuring the speed of ships, by any of the devices thus far produced, are said to be overcome by an ingenious instrument called the rhysimeter, lately invented in England. The indicator, which resembles a barometer in size and appearance, is located in the captain's cabin, a column of mercury showing constantly by its variations the speed which the vessel is making. Its accuracy is said to be perfect, there being no appreciable interference by friction or otherwise; and as the machine is self-registering, it may be made to keep a complete record of the speed of the ship throughout the voyage. The log and all substitutes for it heretofore employed have been found unreliable, especially in changeable weather, or under a heavy sea in either direction.

The rhysimeter is also designed for indicating the velocity of flowing liquids, which is in fact one of its most valuable uses, as it will greatly assist in the solution of many problems in practical hydraulics.—*Ex.*

NOTCHING RAILS.—The officers of several German railways have again reported on the necessity of notching the bottom flanges of rails, and it is stated by one railway company that on a line laid with cast steel rails without notched bases, a dangerous longitudinal shifting of the raile occurred. Generally, however, the practice is not found injurious, though it is thought preferable to have it done at the ends of the rails only, the corners of the notch to be carefully rounded off in all cases.

SCIENTIFIC PROGRESS.

Oxalic Acid and Plants.

The frequent reference in agricultural and other journals to oxalic acid as a constituent of plants has awakened considerable inquiry regarding the history and nature of the substance. The eminent Swedish chemist, Scheele, first discovered the acid, having found it in the juice of the common sorrel, where it exists as a binoxalate of potash. It is generally known under the name of "salt of sorrel, and is very sour to the taste, and poisonous when taken internally.

The crystals, in form and color, so closely resemble those of the sulphate of magnesia (Epsom Salts) that they have often been mistaken for them, and fatal cases of poisoning have resulted from the error. The name, oxalic acid, is derived from the Latin name of the common *wood* sorrel, *Oxalis acetosella*. The *field* sorrel, so plenty and so troublesome to farmers, belongs to an entirely different family of plants, the *Rumex acutosella*, and is classified among the *docks*. This contains considerable of the acid, as also do the lichens, in which it exists as oxalate of lime.

Oxalic acid is the most highly oxidized of all carbon compounds, with the one exception of carbonic acid. It belongs low down in the list of organized products, and may well be regarded as constituting the last stage in the oxidation of carbonaceous substances before they pass into the dead, inorganic condition of carbonic acid. In plants, it seems to be more the product of *decay* than of growth. In lichens, especially, this would appear to be true, as the oxalate of lime found in them forms nearly thirty-five per cent. of the weight of the plant, and it exists in them in its most insoluble form.

In garden rhubarb, the acid is found locked up with lime, and it is a significant fact that it is more abundant in old, than in the new plants. We incline, so far as its connection with plants is concerned, to class it with lignin and some other bodies,—a material which the plant has no further use for, and therefore deposits in the cells in an insoluble condition. All the vegetable acids are inactive agents in plant organisme. They do not appear to perform any leading part in vegetation, and in all their physical and chemical relations are widely different from the active soluble salts and other bodies which are found dissolved in the sap.

Its Artificial Production.

Oxalic acid can be produced artificially with great facility, and it is manufactured and employed in the arts in large amounts. It is curious that in *sawdust*, an utterly waste product, we have a material from which this acid can be produced to any extent, and nearly all of the substance found in the market is now made from sawdust. The sawdust is placed in large vats and moistened with a lye made of caustic soda and potassa. It is then taken out and dried on plates of iron, and the dry mass is washed with warm water to dissolve out everything except the sparingly soluble oxalate of soda. The mother liquors are evaporated to dryness and ignited, to save the potassa, which is used over again. The oxalate of soda is decomposed by boiling with caustic lime; the soda enters into solution and may also be used over again. The oxalate of lime in turn is decomposed by sulphuric acid, and the liquor decanted from the insoluble sulphate of lime, which upon concentration yields crystals of oxalic acid.

This is a brief, imperfect description of an interesting chemical process, and serves to illustrate how science triumphs over obstacles, and produces substances peculiar to vegetables from waste materials. The cost of production is very small, not exceeding a few cents a pound, and if the acid would act upon feldspar, and liberate the potash it contains, as some suppose, its employment might supply a cheap method of procuring this most valuable plant food. But this idea is erroneous, as we have endeavored to show in some former statements.

If the acid is at any time swallowed by mistake, an antidote to the poison is found in any substance containing carbonate of lime, or caustic lime; as such, when brought into its presence, convert it into insoluble oxalate of lime, a substance which is harmless. Chalk, whiting, or plaster from the walls of a room, will serve a good purpose, and either one of these in quantity equal to the amount of acid taken, should be stirred in water and drank as speedily as possible.—*Journal of Chemistry.*

Another Achievement of the Spectroscope.

A new and another most wonderful achievement of that remarkable instrument, the spectroscope, has just been announced by a German astronomer—Dr. Vogel, who has successfully applied this instrument to the measurement of the sun's rotation. The form of instrument used by him was that known as a reversion spectroscope. As originally constructed, it consisted of two direct vision prisms, with their refracting angles facing opposite ways. Hence a beam of light falling upon them produces two spectra, one of which has the colors above the other, and in an inverse order. The object-glass being divided horizontally, and each half being movable micrometrically, it is possible not only to juxtapose, but even to superpose the spectra, and to measure the distances of the lines with great accuracy.

The instrument was devised for the purpose of measuring the direction and velocity of astronomical motions, one of the problems proposed by the inventor being the very one now solved by Dr. Vogel. If the two spectra in the instrument represent, as they may be made to do, different and opposite limbs of the sun, then, since one is approaching us and the other is receding from us, there ought to be a difference in the position of certain spectrum lines. The difference in velocity is about a mile per second; an amount which Zöllner says ought to change the position of the sodium lines by a quantity equal to 1-80th of the distance between them.

With his instrument as originally constructed, he was unable to observe any displacement; but with a more powerful instrument, consisting of a circular train of five highly dispersive prisms thus arranged, which he furnished at Kiel, Dr. Vogel has been able to detect a displacement of the fine line F of the solar spectrum, by an amount which gives a velocity of rotation of 2 miles per second. Subsequent observations, made with more care and with a higher dispersive power, have reduced this number to 1.52 miles per second. This is only 1.28 miles more than the velocity given by Carrington's observations on the spots, which was 1.24 miles per second; an approximation which is remarkable.

PATINA OF BRONZE.—The term "patina" is used to designate a beautiful greenish coating which forms naturally upon the surface of bronze, under the influence of air and moisture; consisting in most cases of a carbonate of copper which adheres very closely, and not only imparts as beautiful appearance to the metal, but also protects it from further oxidation. The formation of this patina proceeds with varying degrees of rapidity in different localities. In some places, especially in large cities where coal is burned in considerable quantity, it does not develop itself, the metal assuming the appearance rather, of a dirty cast iron.

The difference in this respect has received the attention of a scientific body in Prussia, under the direction of which, numerous experiments have been made; and it has been ascertained that the formation of a good patina was not dependent upon the *composition* of the bronze, although the time required for this development may have something to do with the percentage of the different ingredients. It was furthermore discovered that by occasionally washing articles of bronze, exposed to the atmosphere, applying oil, and afterwards rubbing off with a soft rag all of this that could be removed, in the course of a few years a patina of the finest quality is developed irrespective of the location; and in this way the desired result can be, and actually has been produced on objects that had long refused to put on this desired exterior.—*Yale Courant.*

SUBSTITUTE FOR LITHOGRAPHIC STONE.—It is now proposed, but with doubtful promise, to substitute ordinary lithographic stone by the use of a smooth block of wood coated with glue or other gelatinous matter, or with a solution of silicate of soda and bichromate of potash, exposed to sunlight and washed. An ink or pigment is made with gelatinous matter dissolved in a saturated solution of bichromate of potash, with or without chrome, alum, and with a small quantity of ivory-black to render the ink visible. On the prepared block or slab the desired picture or other work is made with this ink, and when dry, exposed to sunlight. After exposure, the surface is covered with gum or glycerine, and is then ready for the printer.—*American Artizan.*

Mining Summary.

The following information is condensed mostly from journals published in the interior, in close proximity to the mines mentioned.

California.

ALPINE COUNTY.

Imperial.—Monitor *Miner*, Jan. 20: The mining property lately kuown as the Imperial, having passed into the hands of a different Co., is to be opened up and worked in a worthy manner.

The sale of the IXL and Buckeye mines is to be followed at as early a day as possihle by the erection of hoisting works and a thorough opening np thereof.

The Tarshish mine is turning out good ore in abundance and it is thought the new 20 stamp mill can he kept running for the first year or so on fine grade ore.

AMADOR COUNTY.

Original Amador Mine. — Amador *Ledger*, Jan. 27: A sale has heen made of the Original Amador mine and mill, at Amador City to an English Co., the purchasers to take possession this week. The price paid has not fully transpired, hut report places the sum paid, from $500,000 to $1,300,000.

CALAVERAS COUNTY.

The Zacetara.—Calaveras *Chronicle*, Jan. 27: The Zacetara mine, near West Point, work upon which was resumed a short time since, extremely rich rock has been discovered and is heing taken out. We understand the quartz averages about $40. There is a mill and other machinery on the mine.

Good Rock.—The Steger mine, in the streets of West Point, is turning out first class rock. The machinery formerly used on the Radford claims in Chili Gulch. was hought hy Steger & Co., and transferred to their mine. It is in full operation, being of sufficient capacity to keep out the water and do the hoisting.

Corral Flat.—Champion & Co. have lowered the water in Corral Flat sufficiently to enahle them to take out gravel from the upper end. They are engaged in taking out a pillar of uew ground and there is no question but that it will pay largely.

New Mining Enterprise.—Richards, Griggs and Dower are about opening a hydraulic on the northern face of French hill. The Co. are already at work fixing ditches, etc. Active operations will be commemced the first of next week.

Jenny Lind.—Cor. same: I will give the names and a short description of a few of the principal claims: First is the Whisky Hill T. M. Co., who have completed a tunnel 800 ft. in length, which was run to ohtain the necessary fall to work their ground to advantage, and to be used as a tail-race. It is furnished with boxes 2 ft. wide, and everything will be ready for active operations in another week. The cost of this tunuel, as it stands, is $12,000. The owners have been 8 years engaged in its construction, but expect that a run of six months will pay a profit equal to the outlay. The adjoining claim, nearly as extensive, is owned and carried on by Myers, Anderson & Co. There are ahout 12 or 14 of this kind of claims here, all of which will he held hy government titles in a short time. The largest and most extensive is the Bunker Hill; they have 120 acres of land. They are putting in a 30-inch flume and expect to use 400 inches of water. The pipe, which conveys the water to the claim, is nearly half a mile in length; the flume is 750 ft. long, the hottom plancd, and on the top has a track and car for running out large rock. The Co. have been to a heavy expense quarrying rock for the purpose of lining the bottom of their flume.

Still "Pans Out."—The claim of Brackett & Co., in Chili Gulch, continues to pay largely. The yield last week was equally as great, in proportion to the number of hands employed, as ever before for the same length of time.

EL DORADO COUNTY.

Heavy Blast.—Placerville *Democrat*, Jan. 27: A blast of 1,500 lhs. of powder was put off in the Hook and Ladder claim, Spanish Hill, last week. It was a perfect success, completely shattering the hank.

Lootown.—Cor. same: The Pocahontas is in active motion. For 16 mouths in succession under the past administration, the flow of bullion was steady and continuous, but the levels ahove being worked out, it became necessary to sink a new shaft nearly 400 ft. in depth, and drift therefrom in each direction—northerly and southerly—some 200 ft. A new hoisting works, containing the largest boiler in the connty, 2 engines, hoisting and pumping machinery, were added to the real property of the Co. Now the mine is open, ore in sight will keep the mill running another 16 months or more, and the mill hammers away day and night.

Ella Quartz Mine.—A late numher of the Sac. *Union* gives the following: In Nov. last, J. J. Orr, discovered the rich croppings of the ledge; he related his discovery to G. W. Paget, and the two, after visiting the spot, determined to organize a Co. to develop the claim. The claim is on a point of land tending to the North Fork of the American river. The ledge is 3,000 ft. long and 6 ft. wide, with a shaft sunk to the depth of 30 ft. Quartz from this claim exhihits no gold to the naked eye, but it will yield $50 to the ton.

INYO COUNTY.

Bullion.—Inyo *Independent*, Jan. 20: Beaudry has about 3,000 hars of bullion at his furnace, awaiting shipment. Belshaw's, Beaudry's and the Swansea works are all in active operation, turning out metal by the cord.

Prospecting.—J. Sharpe, who has returned from the Inyo Range, was on the summit some 6 or 8 weeks. During the time he sunk 6 ft. upon one of his discoveries which he calls the Blne Belle, taking out 2 tons of not less than $200 ore in the operation. The ledge is of unknown width, having every indication of wealth and permanency.

NEVADA COUNTY.

Eureka.—Grass Valley *Republican*, Jan. 25: Work on the tunnel of the Jim mine is steadily progressing. The tunnel is in hetween 600 and 700 ft., and follows near the ledge for a portion of the distance. The ground is soft, and 2 men average 14 ft. per week. The Co. intend to push the tunnel ahead to the main shaft, which is 300 ft. from where they are working. When the shaft is reached the entire mine will be drained and opened and ready for the extraction of ore. Black & Young's mine is heing worked with profit. The ledge is 6 ft. wide, and averages from $10 to $12 a ton. The Erie Co. are running night and day and employ 24 men in their mill and mine. The ledge is 15 ft. wide, and the ore averages from $10 to $14 a ton. A Co. of miners from Virginia City are running a tunnel near Eureka for the Dillon ledge. They have been at work for nearly 2 years, and have their tunnel in about 1,500 ft.

A Good Yield.—Last week the Murchie Bros. crushed 60 tons of rock from the Independent mine, 2 miles ahove Nevada City, near Deer Creek, aud realized $3,600, or at the rate of $60 a ton. The rock is taken from an incline 200 ft. from the surface.

Will Start.—Black & Young's mill and at Eureka has been idle for some time on account of lack of wood. This want has recently heen supplied and work will be commenced again this week.

Discovery.—In the incline shaft of the Nevada quartz mine, 2 miles below Nevada City, a solid body of ore 10 ft. wide has been discovered within a few days. The ore it is said will average $17 a ton, aud is 50 ft. below the bed of Deer crcek.

Through Granite to Slate.—The incline shaft on the Nevada quartz mine, on Deer Creek has struck through the granite rock into slate, and the ledge at the hottom is incased in the walls of the latter.

Daisy Hill.—The machinery for pumping at the Daisy Hill mine started up yesterday for the first time. The machinery used was taken from the Dromedary mine, and is nearly as good as new. The engine for pumping has 10-inch stroke and the hoisting engine 8-inch. The pump commenced work yesterday and will probably free the mine from water by Monday next, The water in the incliue shaft yesterday was 50 ft. deep. The present incline is down 175 ft; 175 loads of ore from the mine has yielded $65 per load.

Red Diamond.—Nevada *Transcript*, Jan. 23: At the Cascades there is considerahle mining going on. The Red Diamond is worked with a full complement of hands and they have plenty of wator.

Providence Mine.—The Providence mine, upon which work was commenced a short time since is being worked regularly. The new incline is down about 90 ft. The works are being put in first rate order, and the mine will he opened hy Spring.

PLACER COUNTY.

Rich Strike.—Auburn *Herald*, Jan. 23: Rumors have reached town that a very rich quartz lead has been opened this week between here and the Greeu mine, and that one man has taken out some $1,500 in 3 days.

Ophir.—Cor. same: Greene & Co., have erected a double engine in the Greene mine, one for hoisting from the shaft, and the other for pumping purposes Some time ago the Co. let a contract to sink the shaft 100 ft. deeper. The contractors are getting along very well, and will complete their contract by early spring. The ledge in the shaft is of good size, looks well and will yield rich ore.

Along the Greene ledge, the next mine in operation is the original Peter Walter. This Co. has erected steam hoisting works and have a 25 horse-power engine. The levels that are heing run are at the depth of 116 ft. from the surface, and they find no variation in the quality or quantity of the rock, it continuing to look well, the quartz showing free gold and plenty of rich sulphurets. The ledge is a good size, and in a short time the mine will be opened thoroughly. The Co. contemplate erecting a ten-stamp mill as soon as the weather will permit.

North of the Peter Walter some 300 yards is the Bellevue, originally the Buckeye. This Co. have at their dump pile near 500 tons of ore that is No. 1. They intend to crush this ore at the St. Patrick mill, and will begin about the 20th of this month. The Bellevue Co. are still raising rock to the surface.

The St. Patrick mill contains 15 stamps, and with all the improvements, sufficient to save the gold and sulphurets, and adequate pans to work the blanket washings and sulphurets. This mill is run by steam, and in connection with it the Co. have a ledge called the Peachy that they are prospecting with a tunnel and shaft. The tunnel will cut the ledge about 130 ft. from the surface. The shaft is down to the depth of 75 ft., and they are running a level at this depth and finding a good sized ledge and good ore, showing as good a prospect as you will find in this dist. The St. Patrick mine is still in operation; they are running a hottom level with a good prospect. They are crushing ore from this mine at their mill, and judging from appearances, it is paying very well. They have a large pile of ore at this mine which they will finish crushing as soon as they get through with the Bellevue rock.

PLUMAS COUNTY.

Rich.—Quinoy *National*, Jan. 20: A few days ago the drift in the Betterton mine, near Mohawk Valley, developea a cross vein, the rock, at the point of intersection being extremely rich.

SOLANO COUNTY.

Vacaville Coal Mine.—Vallejo *Independent*, Jan. 23: Since the late heavy rains, work has been suspended on account of the impossibility of keeping the works clear of water. Dr. Dobbins, on whose land the mine is located, is very sangnine of obtaining a good quality of coal before a great while. A depth of 160 ft. has been reached, the prospects improving as they went down.

Quicksilver. — The quicksilver, mine near this city is in full operation, the smelting furnaces working to perfect satisfaction. The yield of quicksilver from the cinnabar worked is fully as large as anticipated.

TRINITY COUNTY.

A Good Beginning.—Weaverville *Journal*, Jan. 10: Southerlin, Hupp & McMurry have already stripped 12,000 ft. of hed-rock with one month's run of water. They will strip not less than 60,000 square ft. of bod-rock, and they know the grouud to be good.

Nevada.

EUREKA DISTRICT.

McGearry.—Eureka *Sentinel*, July 21: All of the mines show exceedingly well for the amount of work done upon them.

Prospecting.—The surrounding mountains are full of prospectors.

Pinto Mill.—The English Co.'s mill at Pinto is runuing splendidly and proves a most perfect success.

Bio Run.—The Consolidated furnaces turned out 19¼ tons of bullion in 24 hours on last Saturday, which is considered the largest run ever made hy those works. All of the furnaces are working to a charm, and the dumps at the mines are crowded with ore. The mines never looked so well. The new furnace, making 5 in all, is about completed, and will he ready for operation during the present week.

Gen. Lee Cons.—Since the change in management 12 men have been constantly employed in the various workings of the mine and the developments made are beyond all expectation. In the bottom of the old tunuel a shaft has been started which is now down ahout 10 ft., establishing the coutinuity of ore from the surface to that depth, disclosing a well defined and remarkably rich vein of ore 4 feet in width.

Maryland Mine.—The Maryland mine is looking hetter than ever before. At a depth of 280 ft, from the surface the largest body of ore yet found in the mine is being worked. The assays show $305 average, and the vein is from 3 to 9 ft. in width. A tunnel is heing run from the base of the hill, and is within a short distance of the main shaft, which will be tapped at a depth of 300 ft. The Michigan and other mines of the Co., are looking well.

ELY DISTRICT.

Bullion.—Pioche *Record*, Jan. 21: W. F. & Co. shipped since January 18 bullion valued at $19,107.41.

Raymond & Ely.—This mill is in course of construction and will be finished by the 1st. of April.

Raymond & Ely Mill No 2.—All the machinery for this mill is on the ground. The work is being rushed ahead with all possible speed, and in 30 days it will be working ore from the mine.

Fine Prospect.—Williams, Bell & Miller have opened a mine entitled the "Tiger." It is supposed they are on the "positive" vein of the Alps, and from indications such would appear to be the case.

Alps is steadily improving....Newton Booth still drifting on the ledge....The ore of the Page and Panaca, assays $313.75 at the 155 ft. level.

Struck it in No. 7 —Since our last issue Mr. Bowie, Supt. of Meadow Valley, concluded to work the mine for the benefit of the stockholders, instead of for the bears. The result is a large deposit of high grade free milling ore has been struck on the 600-ft. level of No. 7.

Inoomar S. M. Co.—At the depth of 185 ft. the Co. struck a fine hody of ore which gives an average assay of $175.45 to the ton in silver. A new contract was at once let to continue the incline 100 ft deeper on the ledge.

Bowery Mill.—The grading for the mill site is done. Part of the machinery has arrived.

HUMBOLDT.

Bullion.—Unionville *Silver State*, Jan. 27: Amount shipped from the Arizona mine since onr last issue was $4,447.

Arizona Cons.—This mine is looking hetter than it ever did. The south incline is down 150 ft. and the ledge still maintains its regular size and richness. In all the other drifts to the east, the ledge is looking unusually well and is yielding a larger amount of shipping ore in proportion to the quantity mined, thau heretofore. The ore shipped yields at the rate of about $500 per ton.

Brazil Series — Arabia Dist. — The Brazil Series consists of 5 ledges, not far from the Montezuma mine, being in a northerly direction therefrom, distant abont a half mile. A shaft has been sunk on the principal ledge of the series to a depth of 25 ft. exposing a well defined vein about 4 ft. thick all the way down. The ore taken from this shaft assays from $100 to $300 per ton—the entire body between the walls being pay ore. This ledge can be traced on the surface of the ground a distance of 1,500 ft.

Dun Glen. —Cor. same: Mines long neglected are now being looked to with interest by their owners, since the erection of Sprague & Co's. new mill. The mill is a dry crusher, without stamps. It is about one mile above town, in Dun Glen Cañon, and near the Auld Lang Syne mine, which belongs to the Mill Co., and is one of the best in the district. The Co. has out at present about 100 tons of ore which they think will pay $100 per ton. The Auburn mine, a gold-hearing ledge, is looking well, and work is being vigorously prosecuted on it. Some 50 tons of ore from this mine have been worked by Sprague & Co., the result of which was $200 per ton of gold. The Tallulah tunnel is being vigorously pushed. The tunnel is being run for the purpose of striking the lodes, of which there is a series, at a perpendicular depth of 300 ft. below the upper level, and 500 ft. from the surface. It is the intention of the Co. to connect the upper and lower works, by raising a shaft on the lode, thus ventilating the mine, and making room for working plenty of men. This has proven itself to be a good mine. The ore is of a high grade; the last shipment of ore, from the upper level, of 13 tons, was sent to the Swansea, working something over $500 per ton, the tunnel is in over 700 ft., and still driving. The George Peabody mine, a new location is yielding large quantities of good ore. They have shipped some 20 tons to Reno, which yielded about $600 per ton. They have a large qnantity on the dump, ready for shipment.

McCann has struck it rich abont 5 miles from town. He intends pntting up a horse whim, aud putting on a numher of hands.

REESE RIVER.

Shipment for 1871.—Reese River *Reveille*, Jan. 22: The entire shipment of bullion from this city during 1871, is 1,453 bars 121,404 pounds, valued at $1,222,489.81.

Struck It.—Neal & Flynn who are working one of the Florida series of ledges, struck some very good ore yesterday. They have drifted from their incline a distance of 100 ft. to get what appears to be a fine and extensive body of ore.

WASHOE.

Savage Mine.—Virginia *Enterprise*, Jan. 26: The new main incline of the Savage is 180 ft. below the tenth level, 40 ft. above which it starts. The incline is run upon an angle of about 34° and has, therefore, attained a perpendicular depth of about 100 ft. At this point they are engaged in putting in the station timbers for the eleventh level, which will be 1,400 ft. in depth below the surface. While the drift on the eleventh is being run, work will be continued on the incline till it has reached the further perpendicular depth of 100 ft.

Parke & Bowie's mill, on Six-mile Cañon, is steadily running on tailings, of which they have an almost inexhaustible supply.

Eureka Mill.—Rapid progress is being made in the work of setting up the big Eureka mill on Carson River.

Enlarging.—The Crown Point shaft is being enlarged by the addition of another hoisting compartment; this gives the shaft three compartments.

Good progress is being made in putting in the two new engines. When they start up again they expect to take out from 600 to 700 tons of ore per day.

Ophir Mine.—Sinking upon the main shaft was discontinued at the depth of 1,250 ft. Drifting at the 1,100 ft. level is being vigorously prosecuted. The rock, which was so hard at first that but about 3 ft. per day could be made, is of a more favorable character, and the drift is being pushed ahead at the rate of 4 ft. each day. Some work is being done on the 700-ft. level.

WHITE PINE.

Wand Beecher.—White Pine *News*, Jan. 20th: Sinking and drifting in the East end of the Phillpotts chamber, for the purpose of connecting with the East drift of the Lady's chamber.

South Aurora.—Since last report, F. A. Benjamin has resigned the position of Supt. of the South Aurora Co.'s mines, and M. J. Goodfellow has been appointed in his stead. The Sheridan and Mitchell shafts connected with the lower tunnel last week. A drift was started from the bottom of the Sheridan shaft, running west to the spar seam. The foreman is of the opinion that all the shafts will be connected in two weeks from date.

San Juan del Rio.—There is a force of 5 men at work sinking. The ore pitches off at an angle of 45 degrees, and has the appearance of forming into a true fissure vein. Average assays of the first-class ore go $250 to the ton. There are about 70 tons on the dump, which asseys $60 and $70 to the ton.

North Aurora.—Since last report the force of men in the Risdele has been increased. There is a fine body of high-grade ore in sight in the south end of the chamber. The south drift of the Lady's chamber is showing about as usual. Bunches of high-grade ore come in, which is sacked below and shipped separately to mill. Hoisting as usual through the Engine shaft and shipping by tramway to mill.

Second Ex. of Original Hidden Treasure.—A drift was started up recently, running in a southerly direction from the bottom of the Anchor tunnel incline. There is a body of fair ore in sight. The drift running east from the north shaft is in a distance of 19 ft., with ledge matter and black spar in the face.

Gen. Lee.—A drift will start up about the 25th of the month, to run from the ore chamber eastward, and following the spar seam, carrying ore each side. There are about 200 tons of low-grade ore on the dumps, which will be milled in the spring.

Original Hidden Treasure.—A force of men will be put on when the ore broken down is cleared away. The Big Smoky mill is running on Co. ore as usual.

Eberhardt.—Mention was made last week of the West drift running from the Keystone shaft. A body of low-grade ore is in sight in the drift. The work of running ahead was stopped last week, and a shaft started down, for the purpose of testing the depth of the ore body.

Silver Wave.—Work in the Chainoweth, Lyford, and Perkins shafts goes ahead as usual. The Roswell shaft, near the south line of the Original Hidden Treasure, is down to ore. There is also fair ore in the bottom of No. 4 shaft.

Pocotillo.—Driving the main tunnel ahead, in a body of fine ore, and piling on dumps, which will be assorted and shipped to mill in the spring.

Iceberg.—Work was suspended last week, but the usual force of men will be put on after hearing from headquarters.

Noonday.—The ore body holds a width of about 10 ft., and assays about as usual.

Outside Dists.—Piermont.—Work progresses as usual on the mine. The mill is running steadily on Co. ore.

Troy Dist.—Mr. Newton, the manager of the Troy S. M. Co.'s property, reports work going ahead as usual. The hoisting works on the mine will soon be completed.

Friebeng.—Judge Goodwin is making extensive preparations to work the mines. Furnaces are in course of erection in the vicinity.

Schell Creek.—Col. O'Connor's agent arrived at Schellburn last week, and arrangements have been made to commence operations on the mines; and also for the building of mills, at an early day. New shafts and cuts have been started up on locations heretofore unprospected.

Arizona.

Mines and Mining.—Prescott *Miner*, Jan. 13: Porter and Moreland arrived from the Gila mines on Tuesday. The most valuable ledges which had been discovered up to the time of their departure, were the Silver Queen, in the Pioneer Dist.; the Cur, in Nevada dist., and the Yellow Jacket, just outside the latter dist. and close to the waters of the Gila. The Silver Queen is 18 ft. in thickness, and traceable for several miles. The ore containing only a mere trace of lead, with a very large proportion of copper. The Cur is likewise 18 ft. in thickness; a fissure vein which crops out boldly for a considerable distance. The ore is of different character from that of the Silver Queen and not nearly so rich. The Yellow Jacket is a new discovery and had not been prospected.

The operations in Welker and Hassay ampa Dist. have been unusually active. The work of taking out ore from the Benjamin, for shipment to S. F., is progressing apace. Mr. Kelly gives it as his opinion that the 7 tons which are to be sent to S. F. as one of the conditions of the sale, will yield the purchase money, $15,000. The Cornucopia, Prescott and Bismarck, on the dividing ridge between Hessayampa and Walker Dists., and only a few miles from the Benjemin, will be offered for sale in S. F., next month.

In Wallapai Dist., the Keystone ledge, the principal one yet discovered, is considered to be a true fissure vein. Excavations have been made on it to the depth of 45 ft. in which it continues to carry a uniform width of from 4 to 6 ft., the ore worked having yielded from $700 to $800 per ton, in silver. The ledge has been traced and located for a mile.

The Tiger mine is improving rapidly. Col. Heed and G. W. Bowers, this week, brought over with them, specimens of ore showing about as much silver as ore.

Jackson & Co., are still running their mill.

Poland and Gaviu are fixing up for arastraing ore on upper Lynx creek.

The Vulture Co. are doing well.

Mohave Co.—Cor. same: The following mines in this locality are being worked vigorously: The Telegraph, Keyetone, Fairfield and Mayflower. The Washington will be worked from this on, work having been commenced to-day.

Mining and prospecting are being pursued quite lively on all sides. There are more than fifty ledges being worked in this dist.

Three assays of rock from the Fairfield went from $200 to $400 to the ton.

The 5-stamp mill here has not been running recently. The cause, is a want of chemicals.

At Parkerville, an effort will be made to work arestras. Several discoveries of rich galena ore have been made here. The Keystone has 2 shafts, one 40 ft. and the other 50 ft.

Colorado.

Caribou.—Cerihou *Post*, Jan. 13: Parker & Bailey have taken author contract on Wahash, to sink 13 ft. which will make the whole depth 60 ft. This shows constant improvement as depth is gained.

The grand view is opening out splendidly, now sunk to the depth of 45 ft. and with every foot in depth giving evidence of the exhaustless treasures of a true fissure vein of silver. The owners of the Jones lode, west from the Carihou, have built a house over the main shaft, and are prepared to prosecute work in any weather.

Gardiner & Berger have sold the Grey Eagle lode to a Denver party for $5,000.

Hopper & Moore are working the Seven-Thirty.

C. H. Hook, has bought into the Saginaw lode, a very promising silver vein on Pomeroy Mt.

Patterson & Co., owners of the Kearsing furnace purpose to commence smelting early in the Spring.

In Cardinal the Trojan is worked, and the surface and second-class ore is yielding handsomely in the 12 stamper set to the water-power of the Boulder creek.

Enterprise Lode. — The Enterprise Lode, an eastern extension of the Gilpin Co., is improving rapidly, as the work of development progresses. The shaft has reached the depth of 100 ft., disclosing a crevice of pay material from 20 inches to 2 ft. in width, On the north wall there is a vein of mineral 2 or 3 inches in width, principally zinc-blende galena, with occasional spots of brittle silver.

The gangue rock, principally white quartz, feld spar and a proportion of talcose matter, is considered a very good indication of lodes opening out into fine crevices of ore in this locality.

Wand.—The following mines are being worked this winter: The Columbian, on 2 locations, one being the Ward M. Co's. property, No. 10, east; the Menhattan and Celestial lodes, and the Discovery claim on the Sucker. The Ward Co's. 20-stamp mill will be kept running most of the time.

Montana.

New Silver Lode.—Deer Lodge *New North West*, Jan. 13: Mr. C. Bennett returned a few days since from the famous Jefferson silver mines, 20 miles from Helena, where he has been prospecting for the past 2 months. Mr. B. and his partner have succeeded in discovering what bids fair to be one of the richest and most extensive veins found in this country for some time past. They have sunk on it about 12 ft , and at that depth have a body of almost solid galena some 21 ft. in width, which assays from $45 to $100 per ton in silver, and increases in richness with the depth.

Phillipsburg. — The Tudor mine is looking well, showe an 8 ft. veiu of milling ore and is improving in quality. They have a 30 ft. incline and are taking out ore rapidly night and day. A shaft will he driven down on the ledge in the open cut or level now being worked immediately, in order to open it thoroughly and make room for another gang of miners. Brown & Pleisted purpose sinking another working shaft immediately on No. 1, northeast, to open a 100 ft. level on the vein. Upon the "Comanche Ex." they have passed through about 7 ft. of barren rock and struck it better than ever. An incline will be driven down from the tunnel—now about 75 ft. deep—on the vein. There is about 20 ft. face on the vein.

Utah.

Bullion.—Salt Lake *Tribune*, Jan. 20: W. F. & Co. received on the 18th. 17 bars of bullion, 2,626 lbs. valued at $50,726.54 from the Raymond & Ely mine; consigned to New York. On the 20th they received 7 bars, 772 lbs. valued at $9,009.81, from the Meadow Valley Co. also consigned to New York. They forwarded to New York on the 16th, 6 bars, worth $7,456.69 from the Meadow Valley works, and from the Pioche M. Co. 6 bars valued at $9,253.16.

Camp Floyd.—The Camp Floyd M. Co. have 3 mines in the above-named dist. the Sparrow Hawk, Merion and Lest Chance. The Co. is opening the Sperrow Hawk by exposing a large face of the mine with a view of employing 50 men. The whole width is streaked with fine rich veins of ore.

The Co. is preparing to bring water to the mine a distance of 2 miles to supply steam for an engine intended to propel a 30-stamp mill. The mill is intended to be ready for running inside of 90 days.

The Mormon Chief and Grecian Bend are being worked by the Omaha Co. with a steady and favorable development.

The Emery lode is giving employment to a number of hands.

The Queen of the West, Washington, Gen. Lee, Lone Star and other lodes are being developed with favorable results.

Emma Ore.—There are about 1,200 tons of this ore piled up at Sandy Stetion, the present terminus of the Utah Southern. Some 90 tons of this ore were taken out of the mine daily during last week, but the Co. is thinking of dropping down to about half that amount. The ore which is now coming out of the mine is of a higher grade than was ever taken out before; 3 lots of 100 tons each gave an average assay of $275 to the ton.

S. F. Stock Exchange Board.

San Francisco, February 1, 1872.

The mining share market has been active and firm throughout the week. The sales at the Board for the week ending January 24th, amounted to the large sum of $4,540,000. About $93,000 have been received from the Meadow Valley mine since January 6th. On the 25th ult. $5,000 were shipped from the Alps mine. The superintendent of the Raymond & Ely sends down $49,000, and says that he is sending 75 tons of ore daily to each of the two mills. The trustees of the Globe Mining Co. have been elected as follows: A. K. P. Harmon, (President,) J. D. Fry, J. C. Flood, C. B. Land and D. A. Jennings. W. E. Dean was elected secretary. Over 1,000 tons of ore were extracted from the Crown Point mine, last week, assaying $25.36 per ton.

Mining Sales.

Eleven mines, amounting in all to 18,200 feet, in Rush Valley District, have been sold to New York capitalists. This sale is reported as being the first ever made of Utah mines in New York direct, and will give an impetus to mines in that district. The company will immediately proceed to develop their property.

It is reported that the Trenton mine near Galena, has been sold for $100,000.

The extensive mining property known as the Hidden Treasure, about half a mile below Monitor, Alpine Co., has been sold to Eastern parties.

The Queen of the West mine, Camp Floyd District, Utah, has been sold to English capitalists for $175,000.

Artesian Wells.

Why they are so Called—How They are Made—Experiments in Chicago.

Artesian wells are so named from the ancient province of Artris, in France, where natural overflowing wells were found. It is only about eighty years ago that much attention was paid to sinking them by means of machinery. In 1841, after eight years work, a well was sunk at Grenella, near Paris, 1,800 feet deep, which was then considered a great triumph of art. Spangler and Mars, who have sunk nearly all tbe wells in Chicago, bored 2,900 feet at Columbus, Ohio, before they struck a good supply of water. The deepest well in the world is at the sugar refinery in St. Louis, but tbere is so much mineral in the water that it is only used for flushing the floors. This well is considerable over 3,000 feet deep.

Tbe first artesian well sunk in Chicago was the one on Chicago Avenue, at the stone quarry. This was bored under the direct supervision of unseen spirits (?). They directed the doings for the purpose of getting oil. When it would not yield oil they bored deeper for a brine spring, but were content at last to put up with a good yield of passably good fresh water, that is said to bave improved in quality in the last few years.

There are now more than twenty in and about the city. Our reporter visited one of tbese, now being bored at the corner of Franklin and Monroe streets, aud gained the following information in conversation with tbe foreman of Spangler & Mars, who have taken the contract.

Reporter.—I want to learn how to make an artesian well. Can you tell me?

Foreman.—Oh yes; very easily. We muet have power, so we have this strong derrick and steam engine. This derrick has been used a good many times before. We hitch a traveling crank to a beam fastened to the axle of the driving wheel of the engine, which will give us about 45 down strokes a minute. To the other end of this beam we fasten the drill, which works in a swivel, so that the drill can be turned around easily. This is the drill, as you see, about 2 feet long, 4½ inches wide and 2 inches thick, and looks like a very blunt chisel. This drill works up and down in the hole it makee, crushing the rock under it.

Wben the drill gets down about thirty feet we screw on another one of these long poles, thirty-six feet long, and keep it working.

Reporter.—But the hole gets clogged up with dirt doesn't it?

Foreman.—Not so fast as you might think. We change the drill now—as we are going through limestone—once every three hours, in order to put in a sharp tool. The drill has made 8,100 strokes in tbat time, and we get about a pailful of sand.

Reporter.—How do you get the sand out of the hole?

Foreman.—With this sand pump. You see it is just like an old-fashioned wooden pump, with a valve in the bottom. We work this up and down, and the downward plunge opens the valve and allows the sand and water to be forced into the tube, and the upward movement closes the valve so that in a short time the hole is entirely cleaned out, and all the sand is forced into the tube. The pump is then drawn up and emptied.

Reporter.—How fast do you go down?

Foreman.—About eight feet every 12 hours through this limestone, makiug sixteen feet a day, as we work day and night, But when we come to the hard white sandetone like the stone used for making grindstones, we make much less headway, as the drill has to be taken out every twenty minutes, frequently, and a new one put in its place. You can see how even the limestone wears the iron, as this drill is polished smooth, and looks as if it was zinc instead of iron.

Reporter.—What kind of horings do you find here in Chicago?

Foreman.—The first 100 feet is blue clay, and then comes 450 feet of limestone, followed by 250 feet of shale, a kind of soapstone, which is porous and allows a passage for water.

Reporter.—It must have been in that strata that Kimball struck water.

Foreman.—Prohably, as his well is only about 619 feet deep. Well, as I was saying, below the shale we come to 80 feet of sandetone, and then 200 feet of limestone again, with 25 feet of sbale below, in which most of the water about Cbicago has been found; and below this shale we fiud sandstone as far ae any borings have heen made. Tbese are rough figures, that vary a good deal in different wells, but they give the average pretty well.

Reporter.—How do you keep the bore perpendicular?

Foreman.—The dropping is of course as true as a plumb, but if any hard or round stone should turn the drill at all, that tendency is corrected by the "slide" in the first pole. This slide is thirty feet above the drill, and is the same size as the hole. The first joint is the working one. It weighs about niue hundred pounds, and its weight is sufficient, by the incessant pounding and turning which the man at the top gives it, to pulverize the hardest stone. If all the poles acted as one working joint it would jar them dreadfully, but this slide, about two feet long, allows the drill to rebound, when it strikes the hard rock, and takes a great strain off the poles. We are on our tenth pole now, having gone down three hundred and twenty feet.

Reporter.—How much water do you expect a 4¾-inch bore will yield?

Foreman.—That will depend on the pressure. Prohably four hundred or five hundred gallons a minute, enough, at any rate, to flood a floor or a roof in a minute or two. The Bank of England can flood their floors and roof in two minutes, hut I believe they have no artesian well.

Reporter.—What hindrances do you find in horing?

Foreman. — Caving in is one of the worst. When we etrike a quicksand we must put a tube down the size of the bore, to prevent the sand from clogging the drill. The well at the Chicago Alcohol Works has hothered us some by caving in; and then, we frequently meet with boulders, as in the well at Humboldt Park. These are very hard and very trying on the tools. The breaking of the tools is another serious hindrance. Sometimes we break a drill every week, and then there is great delay in getting the broken tools out. Why, it took fifteen months to get the broken tools out of the deep well at Paris; but they manage these things much better here in America. We are not often delayed long in getting out these old stumps.

Reporter.—Pulling teeth witb nine pair of forceps a quarter of a mile long must he ticklish husiuess.

Foreman.—Yes; but we do it after we learn the trade well.

Reporter.—How much does it cost to sink a well.

Foreman.—About $4 a foot for the first 800 feet, and fifty cents a foot advance for every fifty feet below that.

Reporter.—Does it pay to sink wells?

Foreman.—In distilleries, where they pay $2,000 a year for water, a well that costs from $4,000 to $6,000 pays for itself in two or three years. Even the deepest wells pay for tbemselves. The one at Lincoln Park is the deepest one in the city, being 1,555 feet deep, and yet it will pay for itself by saving hydrant water for private consumers.

Reporter.—You must make them much cheaper than they used to do.

Foreman.—Yes. At first they only used seven-feet poles, but Malot, in the deep Paris well, used twenty-seven feet poles, while we uee, as you see, tbirty-six feet ones. Then we can get forty-five to fifty strokes per minute with poles, while the most we could get with cables was forty-one strokes. It takes a Yankee, anyway, to find out how to do things cheaply. We are puttiug down wells cheaper, perhaps, considering everything, than any one else in tbe world, and manage to make our living, at least hy it.—*Chicago Mail.*

Post Office Changes.—The following changes in the Pacific States and Territories, for the week ending January 6tb, 1872, have been announced:

Postmasters appointed—Julian, San Diego County, Cal. Harvey W. Harver. Warm Springs, Deer Lodge County Montana, E. Gerard; Springville, Jefferson County, Montana, John Bayliss; Cacharas, Huerfano County, Colorado, John F. Read.

Name and site of Barrett's Mill, El Paso County, Colorado, changed to Southwater, on the Denver and RioGrande Railroad, and Pierce Walliban appointed Postmaster.

California Fruit in Boston.—Tbe first shipment of California pears ever made to tbis city direct, came to the market this week over the Pacific Railroad, consisting of 400 boxes, each box containing three pecks, of those large, luscious pears for which the Golden State is so celebrated for raising. Tbey were shipped from Sacramento by C. W. Reed, and arrived in splendid condition. The freight bill was $700, and the fruit was consigned to Hilland, Smith & Co., and attracts tbe attention of all who pass by their stall.—*Boston Bulletin*, Jan. 6th.

Singular Explosions.

A correspondent of the *Scientific American*, writing from Norwalk, Ohio, furnisbes that paper with the following particulars of a somewhat remarkable explosion: "I was about to temper a common reamer, by plunging it into sulphuric acid. The moment the heated steel came in contact with the acid, an explosion took place, throwing the acid in all directions, accompanied by a report equal to that made hy a well-loaded shot-gun. The acid was thrown againet the ceiling, about 16 feet high, and over my clothing, face, and left arm, causing very painful sores, and threatening me with loss of sight. The vessel coutaining the acid was a wide-mouthed crockery jar, and there was about two gallons of acid in it at the time. The jar was not broken, but the reamer was blown away from me, and was found much sprung or twisted. I have used this acid very frequently, and have seen many others use it for tempering purposes; but this is the first instance, that I have ever heard of, of an explosion occurring. Indeed, the same lot of acid was afterwards used for tempering, without any indication of a blow up.

I send you this imperfect description of the occurrence, hoping that some of your correspondents will explain the mystery. So many persons are using tbis acid for tempering steel, that any danger attending its use should be pointed out and understood. The lucky escape I had, from heing made blind for life, prompts me to ask you to call attention to this point in your widely circulated and eagerly read columns."

The editor of the *Scientific American* thinks the explosion was caused by the generation of hydrogen during the oxidization of some metallic fragments introduced into the tempering pot through accident or design. This gas mixed in the proper proportions with the air above the acid would form a violently explosive mixture.

Another Singular Explosion.

The N. Y. *Standard* of Jan. 13th, gives the following somewhat singular occurrence in which a man's head was hlown off by the explosion of a beer-barrel:

Yesterday morning, a man named Gillrain, employed at the Long Island brewery, took one of the empty beer-barrels for the purpose of cleansing it. Hot water and lime were put in the barrel, it was then stopped, and submitted to a vigorous shaking. While this process was in operation, gas generated in the barrel, and it exploded with great force. The head of the harrel struck Gillrain in the head, and took his head off, killing him instantly. John Quinn, who was near, or aiding Gillrain at the time, was blown about 12 feet and knocked insensible. His injuries are not of a fatal character. One of the beams in the brewery was nearly cut in two by the head of the barrel after it had taken the head of Gillrain off.

The Brunswick Mill.

The Carson *Register* of the 21st instant, givee the following descriptive details concerning this magnificent new 56-stamp mill, situated on Carson river, just below Empire, beside the track of the Virginia and Truckee railroad: It started into operation on Saturday last, in tbe presence of quite an assemblage of interested spectators, mill-men and others. Every piece of machinery in that vast labyrinth of moving iron, wood, leather, etc., worked like the mechauism of a clock, smooth and almost noiseless. Fifty-six 850-pound stamps were driven up to 88 drops per minnte with scarcely a jar of the floors and without the slighest vibration of the batteries. Tbe whole machinery is driven hy water—about 1,000 cubic feet of water passing tbrough two turbine wheels each minute. One of the turhines is a Lind and the other a Lefelle wheel, each being 48 inches in diameter. These two little wheels, the water having 25 feet fall, give 380 horse power, tbe whole of which may be and is commuuicated to the macbinery by a single helt 42 inches in width. The 56 stamps are partitioned off into 5 and 4-stamp batteries, and the battery hlocks or bed ars set into the solid bed-rock of the hill. The crushing capacity of the mill is from 150 to 165 tons of ore in 24 hours. There are 26 improved Horn pans, each 5 feet in diameter, with an aggregate capacity of 2 tons; 13 settlers, each 8½ feet in diameter, and four wooden agitators, each 10 feet in diameter. The dump, built under the railroad track so that the ore falls from the cars directly into it, will hold 1,200 tons. From this the ore is let down through strong gates raised by iron cogs to the batteries, where there is an immense patent rock crusher. In front of the main building is situated two immense boilers for heating water for the pans, and inside is a little donkey pump for hoisting water to the top of the building or for flooding it almost instantly in case of fire. In the rear are the retails. The tail-race is covered with a double floor, forming a foundation for two large reservoirs for tailings. The force of gravity conducts everything from the ore cars at the top and rear of the building to the agitators far below and thence to the tailing reservoirs.

Artesian Wells of San Jose.

Editors Press:—It is to be regretted that the artesian well system, or rather the system of subterranean lakes of our valleys has not attracted more attention from scientific men. A mistaken notion widely prevails among agriculturists as to the effects of artesian wells upon the surface soils. Many contend that frequent borings have a tendency to dry up the land everywhere, except in the immediate vicinity of the wells. That this idea is erroneous will be readily seen upon a fair statement of the facts.

Taking this valley as a criteriou, we have indubitable proof that the water supply is in subterranean lakes, or basins, hermetically roofed over with a lid of hard-pan, so compact and homogenous that even water cannot penetrate it from above or below. This underground basin has a sort of corrugated conformation — or, more plainly, its hed is full of solid ridges and hillocks which cause the water to remain in beds and channels at various depths from the surface. Tbis accounts for the remarkable difference in the depths at which water is reached in borings in the vicinity of each other. Almost anywhere on the eastern and northeastern side of this city, water can he made to flow abundantly by boring from 45 to 60 feet, while in the heart of the town the same result cannot be effected witbout penetrating from 250 to 500 feet deep.

The reason is obvious. The water lies in independent channels hetween the ridges and hillocks of impenetrable hard-pan. If this be true, there is little danger of the flow of water from the wells in our part of tbe valley depleting the supply of those in another locality. In penetrating to his hidden reservoir, the auger almost invariahly passes through the ordinary alluvial sub-deposits of soil, gravel, sand and boulders, until it reachee the ever present stratum of tougb clay, or "hard-pan." If the well horer has heen eo fortunate as to escape a ridge or hillock, the moment he perforates the clay stratum of gravel, old logs and other pluvial preserves, the water will instantly rise—eometimes with incredible force.

Now, in this operation three or four points are quite apparent. In the first place, the different depths at which the water is reached, indicates that each channel or water bed is separate and distinct from its neighbors.

Secondly. The water beds, no matter how great their distance from the surface, invariably contain drift-wood, and even large logs in a perfect state of preservation, which proves that tbey have, since their deposition, been excluded from atmospheric action.

Thirdly. The supply of water is always obtained in every locality, the moment we pierce through the air-tight lid of hard-pan, thns proving that the entire system of water channels, or water beds are hermetically sealed under a common covering of tough clay.

If it be true that this uuiversal clay stratum is air-tight and water-proof, how in the name of good sense can tapping it and lettiug the pent-up water flow to the eurface, cause the land to become dry in the vicinity? If tbe suhterranean beds and channels are distinctive and independent of each otber, as they doubtless are, how can boring wells on one side of the valley effect those on the other side? The idea is absurd and the sooner we can get to the surface all the water we can from below, the better it will he for the land and the people.

B. F. S.

San Jose, Jan. 20th, 1872.

The supply of India-ruhber is eaid to be inexhaustible. Each tree can be tapped for twenty successive years, and yields on an average three tablespoonfuls aday; 43,000 of tbese trees have heen connted on a tract of land thirty miles long by eigbt wide.

The amount of raiufall iu Shasta for the seasou, up to uoou ou the 5th of January, was 50.14 iuches.

Useful Information.

Vegetable Soap.

Many plants in different countries furnish useful substitutes for soap to the natives, when there are no conveniences or materials for manufacturing ordinary soap. Examples of these are the soapworts, *(Sapindus,)* so called from furnishing, either in the pulp of the fruit or in the root or bark, a vegetable principle called sapoine. Thus the Hindus use the pulp of the fruit of *Sapindus detergens* for washing linen. The capsula of another species, when bruised, forms suds if agitated in hot water; and the natives of India use this as a soap for washing the hair, silk, etc. The aril which surrounds the seed of a South American species is used as a soap. The fresh bark of the root of *Mounina polystachia*, called "*yalhoi*," pounded and moulded into balls, is used by the Peruvians in place of soap.

The *Canadian Naturalist*, from which this portion of our account is taken, also states that the bruised leaves of the European *Saponaria officinalis* forms a lather which much resembles that of soap, and is similarly useful in removing grease-spots. The bark of *Quillaia saponaria* of Central America answers the same purpose, and is used as a detergent by wood-dyers. It has been even imported largely into France, Belgium, etc., and sold in the shops as a cheap substitute for soap. A vegetable soap was prepared some years ago in Jamaica from the leaves of the American aloe, which was found as detergent as Castile soap for washing linen, and had the superior quality of mixing and forming a lather with salt water as well as fresh.

In Peru, the leaves of the *Maguey agave* are used instead of soap. The clothes are wetted, and then beaten with a leaf which has been crushed; a thick white froth is produced, and after rinsing, the clothes are quite clean. The pulpy matter contained in the hard kernel of a tree called "*Del Jaboncillo*" is also used for the same purpose. On being mixed with water, it produces a white froth. In Brazil, soap is made from the ashes of the bassena or broom-plant, *(Sida lanceolata,)* which abounds with alkali. There are also some barks and pods of the native plants used for soaps in China.

The California Soap Plant.

The soap-plant of California *(Phalangium pomeridianum)* is a notable example of this class of vegetable productions, and is found exceedingly useful. The bulbous root, which is the saponaceous portion, resembles the onion, but possesses the quality of cleansing linen equal to any olive soap manufactured. Large amounts of washing fluids are made from this root at the Standard Soap Works in this city (San Francisco).

This soap plant grows all over California. The leaves make their appearance about the middle of November or about six weeks after the rainy season has fairly set in. The plants never grow more than a foot high, and the leaves and stalk drop entirely off in May, though the bulbs remain in the ground all summer without decaying. It is used to wash with in all parts of the country, and by those who know its virtues it is preferred to the best of soap.

The method of using it in its natural state is merely to strip off the husk, dip the clothes into the water, and rub the bulb on them as with soap. It makes a thick lather, and smells not unlike brown soap.

The husks are also utilized in large quantities, by being worked up into an imitation of hair for mattrassee, for which purpose they are found to be a very good substitute.

At St. Nicholas, one of the Cape Verde Islands, they make a soap from the oil of the *Jatropha curcas* seeds, and the ashes of the pawpaw-tree leaf. The oil and ashes are mixed in an iron pot, heated over a fire, and stirred until properly blended. When cool, it is rolled up into balls about the size of a six-pound shot, looking much like our mottled soap, and producing a very good lather.

Small Danger of Ballooning.—Mr. Henry Coxwell, the aeronaut, replying to the hypothesis "that one-half the number of professional aeronauts had been killed in the exercise of their vocation," says that, of the 3,500 ascents executed in Europe and America, fifteen deaths only have been recorded.

If four quarters make a yard, how many will make a garden

Electro-Plating.

In France, where the process of electro-plating is regulated by law, every manufacturer is required to weigh each article when ready for plating, in the presence of a comptroller appointed by the government, and to report the same article for weighing again when the plating has been done. In this way the officers show to the fraction of a grain the amount of the precious metal that has been added, and puts his mark upon the wares accordingly, so that every purchaser may know at a glance just what he is buying.

In ordinary plating an ounce and a half of silver will give to a surface a foot square a coating as thick as common writing paper; consequently, when silver is worth $1.25 per ounce, the value of the silver covering a foot square would be about $1.87. At this rate, a well plated tea or coffee pot is plated at a cost in silver of not more than $1.50 to $2; and the other expenses, including labor, would hardly reach more than half that amount.

Electro-gilding is done in like manner. The very best electro-gilding does not necessarily add a great deal to the cost of the article plated. A silver thimble may be handsomely plated so as to have the appearance of being all gold for five cents, a pencil case for twenty-five cents, and a watch case for one dollar.

Deformed and Monstrous Insects.

We are not greatly surprised to find monstrosities among cattle, as they are of frequent occurrence. A neighbor owns a cow that has six legs, and it is not unusual to meet all kinds of monstrosities among domesticated animals, and the cause is usually attributed to close in-and-in breeding or attempting to cross widely different races. But how are we to account for such freaks when they occur among lower forms of life, for instance, among insects? Such monstrosities do sometimes occur even among minute forms as well as among the larger animals. Beetles, for instance, have naturally six legs; but not long since a specimen of *Pterostichus Prevostii*, Dejeen, was found in Switzerland, having two supplemental legs affixed to one of the ordinary hind legs.

That insects fight and often become maimed is well known to every observer; but whether such deformities have any effect upon the future progeny is a question I leave for Darwinians to answer. I have a specimen of *Carabus* that has one eye in the proper place and the other half hidden in a depression on the under side of the thorax. Perhaps my capturing of this specimen has presented the evolution of a race of cross-eyed beetles; if so, what a pity.

Old Shoes.—You probably think that if you look sharply at an old shoe, when you throw it away, you will know it again if it ever comes back to you. But that doesn't at all follow. One of these days you may button up your dress with an old pair of slippers, comb your hair with a boot, or grasp a cast off slipper while you eat your dinner. You don't see how this can be? Well we'll tell you. Old shoes are turned to account in the following manner: They are cut into very small pieces and kept for a couple of days in chloride of sulphur. The effect of this is to make the leather hard and brittle. Next the material is withdrawn from the action of the chloride of sulphur, washed with water and then dried. When thoroughly dried, it is ground to powder, and mixed with some substance like glue or gum, that causes it to adhere together. It is then pressed into molds and shaped into buttons, combs, knife handles, etc. So you see how it may come to pass that you will comb your hair with a boot and fasten your clothes with a slipper.

Liquid Polish.—The preparation of blacklead ready for use in a fluid state, is a recent English invention. The composition adopted consists of black lead, such as is used for polishing stoves and for other uses, combined with turpentine, water, and sugar or saccharine matter, and the proportions which have been found to answer well are, to each pound by weight of blacklead, one gill of turpentine, one gill of water, and one ounce of sugar; but these proportions may be varied; and in some cases all the ingredients are not necessary.

Elastic Varnish for Leather.—Take two parts by weight of resin, and one of india rubber, and heat them in an earthenware vessel till they are fused together; after which they should be stirred till they are quite cold; a little boiled linseed oil may be added while the materials are hot.

Good Health.

Glycerine Lymph.—Prussia is avowedly the country where regular re-vaccination is most generally practiced, the law making the precaution obligatory on every person, and the authorities conscientiously watching over its performance. As a natural result cases of small-pox are very rare. It has, however, been objected there as here, that lymph is scarce. To make the most of such lymph as there is, some of the European governments have tried its application mixed with glycerine, and the result has been so successful as to lead to a public recommendation of the mixture to official vaccinating surgeons. The manner in which the glycerine lymph is prepared is thus described:—

The pustules of a healthy vaccinated person are opened with a needle, and the effluent matter carefully removed by means of a lancet, the same instrument being gently applied to assist the efflux. The lymph is then best placed in the hollow of a water glass, and there mixed with twice its quantity of chemically pure glycerine and as much distilled water. The liquids are thoroughly well mixed with a paint brush. The mixture may be preserved for use in capillary tubes or small medicine glasses. The lymph thus procured is considered equal in effect to pure lymph; care must, however, be taken to shake it before use. As the same quantity that now suffices for one is made to suffice for five, the discovery ought to be extremely useful in crowded cities like ours.

Heartburn.—Why the sensation occasioned by the presence of an acrid acid in the stomach should be called heartburn it is difficult to say, as the distress is not even in the immediate vicinity of the heart. Common parlance, however, has sanctioned the misnomer, and like many other erroneous terms in general use, it is a fixture in our language. Bi-carbonate of soda is usually given for heartburn; but it merely neutralizes the acidity for the time being, and does not prevent a speedy return of the complaint. In fact, all the alkaline solutions given to relieve the burning, serve to weaken the stomach and thereby aggravate the cause of the ailment, viz.—indigestion. What is needed in such cases is something, which, by toning and invigorating the gastric membrane and thus promoting a free flow of the secretion which dissolves the food, accelerates the work of digestion and assimilation. Avoid nostrums and consult a physician.

Sleeplessness.—The cure of sleeplessness is sometimes difficult, particularly in those who carry grave responsibilities. The habit of sleeping well is one which, if broken up for any length of time, is not easily recovered. Often a severe illness, treated by powerful drugs, so deranges the nervous system that sleep is never sweet after. Or perhaps long continued watchfulness produces the same effect; or hard study, or too little exercise of the muscular system, or tea and whisky drinking and tobacco using.—*Home and Health.*

Linseed Syrup.—To make linseed syrup for a cough, boil one ounce of linseed in a quart of water for an hour; strain it and add to the liquid the juice of two lemons and a half pound of rock candy. If the cough is accompanied by weakness and loss of appetite, add half an ounce of powdered gum arabic. Set this to simmer for half an hour, stirring it occasionally. Take a wine-glass full whenever the cough is troublesome.

Diarrhea and Bowel Cordial.—The following is an excellent formula for a cordial to keep in the household, and was prepared by a physician who used it with great success in his practice: Chalk mixture 3½ oz.; tincture of Jamaica ginger, ½ oz.; laudanum, 1 drachm. Mix and keep in a cool place. Shake the bottle before using. Dose for an adult, one teaspoonful as often as necessary; children, half dose or less.

Pulse of Various Animals.—The pulse of our domestic animals, as given by Vatel, in his Veterinary Pathology, is as follows: Horse, from 32 to 38 pulsations per minute; ox or cow, 25 to 42; ass 48 to 54; sheep, 70 to 79; dog, 90 to 100; cat, 110 to 120; rabbit, 120; guinea pig, 140; duck, 135; hen, 140.

There is no rule of health more important than "keep the feet dry and warm, and the head cool."—An old story, but one worthy of being often repeated.

Persons afflicted with eruptive diseases should not use salt fish.

Expanding the Lungs.—Step out into the purest air you can find, stand perfectly erect, with head and shoulders back, and then, fixing the lips as if you were going to whistle, draw the air through the lips into the lungs. When the chest is about half full, gradually raise the arms, keeping them extended with the palms of the hands down, as you suck in the air, so as to bring them over the head just as the lungs are quite full. Then drop the thumbs inward, and, after forcing the arms backward and the chest open, reverse the process by which you draw your breath, until the lungs are empty. This process should be repeated immediately after bathing, and several times during the day. It is impossible to describe, to one who has never tried it, the glorious sense of vigor which follows this exercise.—*Home and Health.*

Why the Color of Blood Changes.—The cause of the change of color in blood—darkening when exposed to carbonic acid, and brightening when under the influence of oxygen—is not as yet thoroughly understood. It is thought, however, that the red corpuscles contained in the blood are rendered flatter by oxygen gas, while they are distended by the action of carbonic acid. It is not improbable that under the former circumstances they may reflect the light more strongly, and thus give a more distinct coloration to the blood; while, under the latter, they may transmit more light, and so allow the blood to appear darker and duller. Both of those theories have able advocates.

Darkness in the Treatment of Small-Pox.—If a patient, in the beginning of the attack, be put in a room from which absolutely all light is excluded save that of a candle, the effect is to arrest the disease in the papular or vesicular stage; the skin between the vesicles is never inflamed nor swollen; the large scabs of matter never form over the face; there is no intense pain, and only trifling itching, and the smell is either very slight or altogether wanting.—*London Lancet.*

A Word about Cider.—Alexander Fraser, in the *Independent*, says: "For many bilious complaints, sour cider is a specific, and in such cases is one of the good things to be received with thanksgiving. Cider guzzlers are an abomination, but, if dyspeptics will take a little with their dinner, they will find digestion greatly aided. We go in for the manufacture of a good, pure article, and, in the use of it, to let our moderation be known to all men."

Oakum as a Dressing for Burns.—Mr. Robert L. Snow says of oakum, as a dressing for burns, that it induces the healing of extensive sores with remarkable rapidity; it induces healing action in those indolent ulcers that are the result of defective hygienic conditions; it prevents all smell; it is cheap, saves time and trouble; and, most important of all, the resulting scars do not contract.

It is said that cod liver oil may be taken as agreeably as a sardine, if a small quantity of salt be first placed on the tongue; and castor oil may be made perfectly palatable by rubbing two drops of oil of cinnamon with an ounce of glycerine and adding to it one ounce of the castor oil.

For Chronic diarrhea the following is said to be very efficacious, in many cases: put a tablespoonful of wheat flour in a tumbler of water, heat until it foams, and drink immediately. If the patient is thirsty, more water may be added. It should be taken four times a day; before meal times and on going to bed.

Cure for Ingrowing Nails.—Heat a small piece of tallow in an iron spoon; drop two or three drops between the nail and outside flesh. It will not be necessary to repeat this if proper pains is taken to so apply this liquid as to cause that it will insinuate itself in every interstice under the nail. Repeat, if necessary.

The Clover Cancer Cure.—Dr. Needham, in the *Journal of Materia Medica*, advises the use of the fluid extract of clover in cancer, and from the testimony of other medical journals it would appear that it has a far better claim than cundurango to be considered a specific in that disease.

To Purify the Blood.—A well known physician says that he considers the following prescription for purifying the blood as the best he has ever used: One ounce yellow dock, one half ounce horseradish, one quart hard cider. Dose, one wine-glass full four times a day.

Notices to Correspondents.

Eds. Press:—Will you he kind enough to inform me what is the proper composition to put into a oylinder to grease it.

A. B.

Good clean tallow is generally considered the hsst luhricant. Much of the tallow—especially the cheapsst—in the market has more or less acid, deleterious to the cylinder, which is put in in "doctoring" or manufacturing the tallow. Lard oil is nsed largely in locomotives and is increasing in general use for steam cylinders. In the West Indies, oocoa oil is used with first-rate effect. The hsst lubricant, however, appears to differ with different cylinders—prohahly on account of the hardness of the grain of the metal—sometimes oil and semetimes tallow proving to he the hest. Instances are known when neither operate favorahly, in which case the introdnction of plumhago is made with the oil or tallow.

Two Years in Advance.—Messrs. Chamherlain and Chaffse, of Garrote, Tuolumne Co., have taken the advantage of our offer to furnish the Press for two years for the sum of $7 in advance. They take hoth the Scientifio Press and the Paoifio Rural Press on the same terms—sending us $14. No douht they will read our weekly issue with a little extra satisfaction, that they are ahead of the time in their patronage, while such friendship and confidence placed in us will certainly stimulate onr efforts to give them hetter puhlications weekly, ere their suhscription ends.

On File.—Communications from "Eagle Quill" and "L. B. H."

Earnest Talk to Miners.

[For the Press—By Our Miner—No. 1.]

THE MINING tNTEREST.

It is a very remarkahle fsct, that the mining interests of the Pacific Cosst exsrciss less influence over legislation than any other hranch of productivs industry.

Manufacturers are proteoted hy tariff laws, capital is encouraged hy partial immunity from taxation, meohanics, artisans and lahorers in almost every department of industry, exoept mining, have had their hours of toil shortened hy law, while the mining interest appears to bs scarcely considered in either the State or National legialatures. Of the oountless laws passed within the past ten years, relating to mining, the grest majority were framed to henefit speculators aud land grahhers at the expense of the miners.

It cannot he fairly slleged in explanation of this nsglect of the mining interest, that its importance is suhordinate to that of other interests which are encouraged hy spscial legislation and other privileges. It cannot be denied that the mining intorest laid the foundation and sustains the States of California and Nevada, the Territories of Arizona, Idaho and Montana. The commerce and trade of these States and Territories, now so important, would prohahly never have existed hut for the development of this intersst; the great transcontinental railway, and the many lines of steamers which conuect San Francisco with China, Japan, Australia, Mexico and the islands of the Pacific, would not have heen estahlished in our day and generation hut for the development of the mining interest.

It is unnecessary to enter into details of the henefits the people of the whole Repuhlic have derived from the development of the mining interest of the Pacific Coast. It is presumed that every intelligent reader will admit that a department of industry, which in a little more than twenty years has produced upwards of a thousand million dollars worth of hullion, is of sufficient importance to ohtain much more consideration from the State and National Governments than it has received heretofore.

In view of the efforts heing made hy spsculators to induce the Federal Government to sell in large parcels the mineral lands of the puhlic domain, agaiust the wishes of the miners, it becomes a question of great importance to every one connected with the mining interest on the Pacific Coast, either as owners of a mine, miner or lahorer, to ascertain why their wishes are disregarded and their interests neglected hy the State and National legislatures. An investigation of the suhject will show that the cause of this neglect springs from a want of unity of action among the mine owners and miners.

The census of 1870 shows that, with the exception of agriculturists, the miners form the largest class of producers in the State. From what we know of them, as a class, we feel certain that this want of unity and consequent loss of influence is not the result of ignorance; hecause we know that among the ranks of the miners of California are gentlemen of ripe scholarship, good hnsiness capacity, great enterprise and energy, we desire to call their attention to this very important suhject of unity of action. We shall devote our hsst efforts to remove this cause of degradation and neglect of the mining interests. For this purpose we respectfully hut earnestly solicit the aid of the miners throughout the Pacific States and Territories to aid us hy their advice and counsel.

We desire to obtain materials for framing a correct estimate and reprssentation of the mining interest, which we helieve can he best obtained through the opinions of individuals who write from their own experience and ohaervations.

We dssire that every psrson who feels an intereat in this important suhject to send us their opinion upon all matters relating to the mining interest of the Pacific Coast, which we will condense and embody in a series of articles which we helieve will he of very great advantage to that interest.

Hints to Miners.—No. 9.

In our last number we promised to continue the suhjsct of

Cleaning and Rstorting Gotd Amalgam,

and accordingly proceed to do so. When the coarse fragmonts of iron or quartz are removed and the quicksilver fesls homogenous the sponge is again used to remove all the wster. A piece of soft unglazed paper is then plunged through the mercury until it is dry. A small piece of hlanket or flannel five or six inches square is then held hy two corners and drawn toward the operator, while it is lying flat on the surface of the quicksilver. This will clear it of the iron, which, hy a dexterous turn of the cloth may he removed. The hands are again plunged in and hy the agitation, more iron and sand comes to the surface and is taken off as hefore. This operation is repeated until the mercury is perfectly liquid and clean, and until no more impurity rises to the surface when freshly agitated.

The Quicksilver.

The quicksilver is then poured iuto a linen bag of the proper texture, which retains most of the amalgam. By retorting the mercury which passes through, the halance may be removed. It is not usually thought hest to remove the last traces of gold from the quicksilver, except in a general clean up, or after some special run, where it is required to determine the full yield of a certain lot or sample of rock; for it is found that meroury containing some gold (when there is no hase metal contained in it) works much hstter than freshly retorted and consequently pure mercnry.

When the amalgam has drained sufficiently, it must he removed from the hag and placed with the comparatively olean amalgam from the copper plates.

Squeezing the Amatgam.

To make the cleaning perfect, all the amalgam is squeezed in a piece of chamois leather or cotton rag, and the hard hall plaoed in a olean iron pan and hroken down with the thumh. By this treatment it hecomes soft and any fragments of iron or quartz left accidentally in the copper-plate amalgam hecome disengaged and may he removed. The whole of the amalgam is again squeszed and the process of "hreaking down" with the thumh repeated, until it hecomes homogenous and hard. It is then rsady for the retort.

Retorting.

The operation of retorting is so simple that it hardly requires a description, still as many inexperienced persons may read this, it will he given.

For small operations, the retort used is a deep cast-iron vessel, shaped somewhat like a bowl. The top edge is planed level and upon this fits a cover also planod level and true, so that when put together the two parts form a perfect joint. From the cover, an iron tuhe rises and hends downward at an angle of ahout 20° from the horizontal. The cover is fastened hy a clamp and set screw. A mixture of wood ashes and clay is prspared hy making them into a thick paste with water. When all is ready, the halls of amalgam are placed in the bowl, the mixture of ashes is put thickly around the edge; the cover is fitted, clamp adjusted, and the whole firmly fixed hy means of the set screw; all the superfinous luting is removed and the retort placed in a furnace over a moderate fire. The end of the pipe must dip just helow the surface of water, placed in any convenient vessel; if the fire is kept well under control there will he no necessity of cooling the pipe. It sometimes happens that when the amalgam has bson imperfectly cleaned that the gold will stick to the retort; this may he obviated hy ohalking the interior of the retort or putting a piece of oommon writing paper undsr the ball. However, when the amalgam is clean and free from baseness, it will come out easily.

A Convenient Method.

A very convenient way to retort is, to drive two stakes into the ground and to fasten a small iron rod to each at a convenient hight. Upou this ths retort is hung, and around it a fire of small wood is built.

Wheu the retort has attained a dull red heat, and no more mercury distils over, the fire is put out and the retort allowed to oool; tho cover is taken off and the hullion removed. It will be found to he metallic in appearance and of a gold color. It is ready for the melting pot as soon as taken out.

Caution in Opening the Retort.

It is never safe to open the retort before it is cool, nor will it stand being cooled in water. Many persons have done themselves great injury in their impatience to see the result of an importaut run hy opening the hot retort and inhaling the poisonous mercurial fumes.

Retorting Ouicksilver Alone.

When it is required to retort quicksilver, the retort is usod in the same way as amalgam, with this exception; a handful of shingle nails is plaoed ou the surface of the mercury which prevents any violent ehullition of the metal.

In all quartz mills there should he a small room expressly for the amalgamator where the amalgam should be taken for treatment. It should he furnished with a strong trough. Just ahove the water, a shelf should be placed upon which to set the pan while cleaning the amalgam. Any quicksilver accidentally spilled while washing may he removed at any time by drawing off the water. The trough should be furnished with a hydrant, which should furnish an abundant supply of water.

Geological Museum.

Mr. Henry G. Hanks, the assayer, whose fine collections of minerals at the late Mechanics' Institute Fair attracted so much attention, has estahlished a claim on the gratitude of the mining community hy giving free access to his collection. He has gone to considerable expense and trouhle in fitting up a large room with fine cahinets and cases in which the numerons minerals, fossils, etc., aro placed and appropriately lahelled. Mr. Hanks, while following his husiness of assayer, chemist and teacher, during a long rssidence in this State, has labored assiduously and successfully in collecting specimens of the various ores, etc., from different parts of the world, and now has a rare and valuahle collection.

Differing from the general custom of collectors, Mr. Hanks has kindly thrown open his doors to the general puhlic and cordially invites both residents and visitors to the city to call and sce his specimsns. Miners, tourists, school children (accompanied hy their teachers) have free access to the muscum at all times. All young men and old ones, too, who are interested in geology and mineralogy and who are desirous of psrfecting themselves in the knowledge of judging the character of ores will find this an excsllent opportunity of which to avail themselves. More can be learned in one hour hy examining these correctly labelled specimens than hy poring over soms technical work for a month. Miners from the interior who wish to see the diversified character of the ores of the Pacific slopo have here a chance to do so. In a short time free of cost they can acqnire a better knowledge of the different ores and minerals than could be gained hy traveling among the mines for years.

The collection is too varied to admit of any special mention, hut we hope all of our friends in the interior will bear in mind to call and see it dnring their visit to town. We are sure from our acquaintance with Mr. Hanks that thoy will be recsived politely and every facility given them for minute observation. The mnseum is sitnated at No. 649 Clay street, hetween Montgomery and Kearny.

The Highest and Lowest Prices of Mining Stocks During 1871.

The fluctuation of mining stocks is proverbially great, and in order that our readers may see the difference that has existed at different times during the year, we give below the highest and lowest prices with the time of occurrence, of the more prominent mines dealt in at the San Francisco Stock Board.

Alpha was highest in September and October, $20, lowest in January, $3.
Amador $390 in April, $265 in August.
Belcher $450 in December, $6¼ in January.
Chollar-Potosi $90 in April, $27 in Sept.
Crown Point $170 in December, $15¼ in Jan.
Cons. Virginia $18¾ in April, $1¾ in Feb.
Daney $12¼ in September, $2½ in January.
Eureka Cons. $29 in November, $7¼ in Jan.
Eureka $365 in January, $11 in August
Empire Mill $25 in May, $1 in April.
Gould & Curry $178 in June, $40 in March.
Golden Chariot $85 in Feb., $4¼ in Nov.
Hale & Norcross $145 in July, $51 in April.
Ida Elmore $20¼ in December, $2 in Nov.
Imperial $85 in May, $3¼ in September.
Mammoth 80 cents in March and October, 22 cents in February.
Meadow Valley $36¼ in November, $13¼ in March.
Ophir $33¼ in December, $3¼ in January.
Original Hidden Treasure $12¼ in June, $3 in February.
Overman $41 in Aug., $2 in Jan. and Feb.
Raymond & Ely $150 in October, 15 in Jan. and July.
Savage $80 in March, $33 in August.
Segregated Belcher $45 in October, $1¼ in January and February.
Sierra Nevada $33 in December, $3 in Aug.
St. Patrick $55 in May, $20 in September.
Yellow Jacket $80 in March, $8¼ in Dec.
Pioche $28¾ in September, $4 in December.
Washington & Creole $8¾ in September, $4 in November.

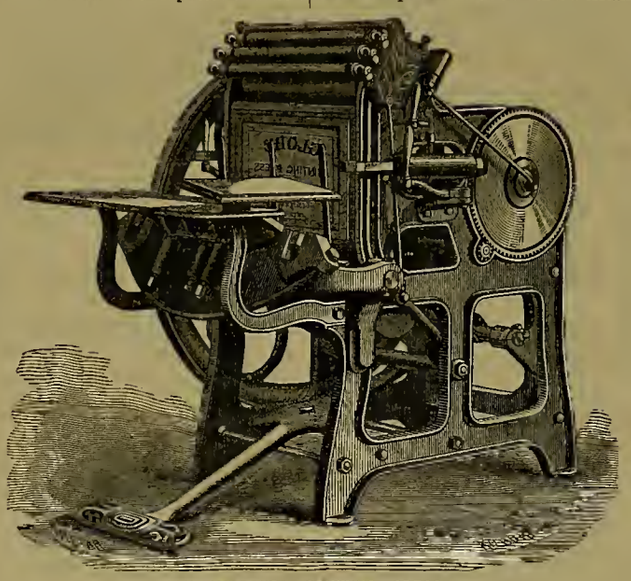
Marysville Foundry.—This well known foundry, which turns out a good share of the best mining machinery on the Coast, being in a favorable location for that work, has its advantages further increased by the addition of a new partner to the firm. Mr. W. R. Eckart, who has been successful as an engineer, superintendent and draftsman on this Coast, and whose name is connected with the well known Scott and Eckart cut-off engine, has entered the establisbment as one of its proprietors. Messrs. Prescott & Scheidel are well known men in their line of business, and we are certain that with their accomplished assistant, Mr. Eckart, in their firm, their business will be increased still more to the satisfaction of themselves and patrons. Making a wide range of mining, farming and other machinery suitable to the times and locality, this pioneer establishment has, we believe, suffered less from continued dull times, than any other foundry in the State of equal size and importance. We should like a report from month to month of the work the new firm turns out, as it surely indicates more or less of the thrift and industry of various and important sections of the interior.

The Snow Blockades.—Overland travel has been seriously impeded this winter by some blockades, and the one now existing on the Union Pacific is rather serious. We hear continually of snow-bound trains, heavy storms, dissatisfied passengers, delayed mails, etc. A good deal of valuable freight is lying at different points on the routs and provisions and fuel are becoming scarce, not only on the trains but also at the different stations along the road. The mails for this city are some nine days behind time and nobody knows when they will arrive. This puts business men and everybody else to considerable inconvenience, but it cannot be helped. We have become so used to the morning mail from the East that we have almost forgotten the days when it came by steamer and was so long on the way.

Lumber Drying Apparatus.—Messrs. Lord & Hall have utilized the escape steam at Vesler's sawmill, Puget Sound, by turning it into an air-tight chest made for the purpose of drying lumber. The *Dispatch* says that the experiment works well, and that lumber can be taken from the log and thoroughly dried by this process in forty-eight hours.

An Improved Printing Press.

There is no department of mechanical construction in which more ingenuity has been exercised or more progress made, than in the construction of printing presses. The illustration which is herewith given represents one of the most approved machines for all classes of job work, and is known as the "Globe Press," of which there are three sizes manufactured. The sheets are placed upon the platen, opposite to, and inclined from, the bed in front of the pressman, whose position can be apprehended by observing, that the foot rests on the treadle. The bed of the press upon which the type are fastened, shows the word Globe in the form in this representation. The type are inked by the passage over them of the rollers, seen in the engraving at the point of distribution, on the inking cylinder. The action of the press is entirely automatic, the power being given by the foot on the treadle or by a belt to a driving wheel. The presses of this kind are now for the first time received in this city, by the California Type Co., of which Mr. Geo. L. Faulkner is agent. They are considered a decided improvement in several respects on machines of this pattern which



AN IMPROVED PRINTING PRESS.

have heretofore been known to the craft in the United States. The enterprising manufacturers have been for some time industriously at work to remedy the defects which experience had shown to exist in the early presses of this pattern, and now, while all the good features are retained, and some new ones added, they are building a press that is pronounced much more simple and compact than formerly, and quite as strong and durable, and fully equal in ornamental design and finish, to any press in the market. *Round's Printers' Cabinet*, standard authority in these matters, says that "experienced pressmen now pronounce them equal in all respects to any press made, while the peculiar features for which they are particularly noted, commend them to many as decidedly superior.

Some of the advantages of this press consist in throwing off the impression at will; the accessible vertical position of the bed in plain view of the operator; the long period of "rest" of the platen, favoring a careful laying of the sheets; detention at will of vibrating rollers on an unusually large distributing cylinder; a simple and quick fastening and releasing the chase; easy and precise adjustment of the grippers, while placed flat on the tympan sheet, and the impression arms which grasp the yoke of the platen and with a gentle pull giving the impression with a dwell quite preferable to that obtained by the crank motion of other presses.

Loss by Abrasion.—The milled edges of our coin causes more loss in weight from abrasion than is generally supposed. We frequently meet with a piece of coin, the edges of which has become smooth by use; but unless it is refused by some prudent storekeeper in exchange for goods, little attention is paid to it. The government is the loser. Julius Jeffreys, F. R. S., says that a single bank has lost £7,000 in one year by light gold through abrasion, and thinks a good deal is due to the steel edges of the banker's shovels. On one occasion when entering the Bank of England he was struck by the glittering aspect of the whole counter, upon which the sun was shining. Myriads of particles of gold were reflecting the sunlight to the eye. It was manifest that these particles had been struck off from the sovereigns which had changed hands over the counter that day, and mainly by the sharp steel edges of the shovels in each endeavor to undermine the coins. It was also plain that in the mutual friction of the coins the milled edges must do the work of mutual raspings as effectually as any form that could be chosen with that design.

To White Pine Subscribers.—We have received the positive assertion that a certain postmaster in White Pine county, Nevada, has asserted that the goodly numbers of copies of the Scientific Press sent to that post-officears "in the way;" that he delivers copies to whoever calls for them "regardless of names;" that he *gave* "a batch of them to a miner from a certain canon who wanted some reading matter;" that he has upon an occasion said: "Some one has robbed the office of all the Scientific Presses it contained, etc. Now if these are facts, we think the aforesaid postmaster will recognize this article, if some subscriber will present him a marked paper; if that don't do him any good, we will show it to the Postal Agent for this Coast, with names of person and place. If there are any other like postmasters to whom respectable newspapers are "in the way," we hope our subscribers will report them. Postmasters generally are very obliging to our subscribers, and we know our interests are mutual. Although a freely abused class of officers, we know that most of them are very worthy and obliging. It is really for their interest to be so. The particular post-office alluded to above was formerly complained of for having a "grab-box" in which all the newspapers were put, and subscribers were obliged to help themselves to their papers out of it—if they could find them. That style of "keeping post-office" has ceased in California, and ought to be abolished in Nevada—if it isn't.

General Lee Consolidated.—It is reported that this mine, located in Eureka District, has changed owners at large figures, the principal purchasers being J. B. Haggin, Lloyd Tevis, Geo. Hearst and Henry A. Fox, all of this city. Extensive improvements are contemplated.

Wren's Ore Concentrator.

Our readers will naturally look with interest to anything that promises improvements in the mode of working silver ores, and their attention is directed to the following notice of the improved concentrator of Mr. Thos. Wren, which appears in the Reese River *Reveille* of a late date:

This new and so far successful invention has, after provoking delays and innumerable obstacles, been set at work in good earnest.

The machinery consists of a twelve-horse power engine; a Wheeler's crusher of the largest size; a revolving screen, set at a slight angle, open at both ends, the upper and greater part of the screen covered with a No. 60 wire screen or sieve, the lower lesser part with a coarse sieve; and the necessary appurtenances, running gear, etc., for the whole.

The process is simple, though entirely scientific. The rock, after being thoroughly dried in the kiln, is fed into the crusher, whence, by means of a spout, it is conducted and fed into the upper end of the revolving screen. The pulp passes through the fine screen, while the waste passes through the coarse screen. The pieces of rock too large to pass through either sieve of the screen are discharged at the lower open end.

The rock discharged through the end of the screen is carried by an elevator back to and passed through the crusher and screen. By these means low-grade ores, which have heretofore been worthless on account of the cost of milling, can be worked at a profit. The expense of running the works are: one engineer, one man to feed the crusher, one man to tend the drying kiln, and one cord of wood per day. The capacity of the apparatus will probably be considered over 20 tons for a working day of ten hours. The principle of working this exceedingly cheap and simple apparatus is this: Mineral-bearing rock is friable at those parts containing the mineral—therefore it is the more easily fractured at that point. The crusher has both a crushing and a grinding motion; the rock being broken into small pieces exposes its mineral surfaces, which, grinding against each other, is disintegrated from the gangue; and, being in fine particles, is passed through the screen in the form of pulp. It is then further concentrated by means of water, the fine particles of granite, quartz and sand being washed off.

We have not room at present for a more detailed statement; but any millman or mechanic will be able to see at a glance the principle of the invention.

It is now running on the old waste dump of the Savage mine. The dump is largely mixed with granite or clay and will average about $25 per ton as it lies. From this comparatively worthless grade of ore three tons are reduced to about one ton of pulp, assaying fully $60, the residue assaying about $5 per ton. The $60 pulp is then further reduced by water to an amount assaying at the rate of $150.

New Mining Law.—The telegraph informs us that the Legislature of Utah has under consideration a new mining law for that Territory. It provides that in order to hold claims, $50 worth of work shall be performed for every 200 feet located, and for every tunnel site, $500 worth of work must be done. All locations and transfers must be recorded in the County Recorder's office of the respective counties, locators to hold their claims as real estate. It is said that the miners are strongly opposed to the bill.

Coal Mines on Fire.—We understand that the Bellingham Bay Coal mines are in danger of being destroyed by fire. It has been smouldering for some time, but has recently got beyond control and threatens to consume the whole seam. A few days ago the flames drove out the workmen, and it is now suggested to deluge the mine in order to save the workings from destruction.

Received, from Gov. Potts, of Montana, the Report of the Auditor and Treasurer of that Territory, for the years 1870-71. As an encouragement to stock-raisers, which he thinks in the future will be one of the strongest dependences for the revenue of the territory the Auditor recommends that all thoroughbred stock brought into the territory be exempt from assessment and taxation for the first year.

DOMESTIC ECONOMY.

The Heating of Our Houses.

Entering the door of one of our "comfortable" modern houses, what meets us? A puff of scorched air from a register, redolent of burning iron—or of boiled air from a steam heater. The thermometer is standing at about 744°. We advance to the parlor. There matters are even worse, for no outside cold has entered with momentary freshness. The plants in the window look yellow and forlorn. Ominous cracks are visible here and there in the furniture—nay, a strip of ornamental veneer has actually split off from the piano and lies on the carpet. Our hostess, coming forward to greet us, is wrapped in a little shawl, and remarks that it is an awful day; that she hasn't been out, of course, but even in the warm house has felt the cold. In effect, she looks blue and pinched. Whereat we wonder, for the room *feels* insufferably hot; but we place ourselves beside her where she sits cowering over the register, and conversation goes on with what spirit it may under these circumstances.

At the end of an hour we are surprised to find ourselves a little chilly. That is, our head is hot enough—a little too hot, perhaps—but both hands and feet are cold, and we are inclined to agree with our friend when she opines that "the girl" must have let the fire go down. But glanciug at the thermometer, we stare to see that the mercury has risen instead of falling. It is now at 80°. And, after all, why should we wonder? Nature is inevitable in her retributions, and we, no less than the poor geranium in the window, must suffer the penalty of a deranged circulation when we violate her laws of temperature.

Bad enough, if this were all! One can live and be useful under the trifling discomfort of cold extremities, as our worthy forefathers sufficiently proved. But how much of life and of life's best energies, of thought, of wit, of good-humor, of aspiration, goes down through those holes in the floor into neither silence? As from some Kobold's cave, the invisible gnomes of the furnace climb, emerge, and steal from us the choicest, finest, most intangible part of ourselves. No man ever lived and worked his best in a room heated over 68°—a sentence we should like to engrave in letters of gold on the iron plate of every register and the front of every steam heater in the land from this day forth and forever.—*Scribner.*

REMNANTS OF FOOD.—A dish that has no more than the *appearance* of palatableness has at least as much to recommend it. Nicety of appearance is inexpensive and within the reach of the humblest. We have in mind special reference to the serving of the remnants of food, which, above all dishes, require dainty arrauge-ment. If cold meat is to be served, it should be thinly sliced and laid on a clean platter. Remnants of food should never be put away in gravy, if inteuded to be eaten oold. Warmed-up vegetables, stewed fruits, sauces, puddings, etc., should appear on the table in clean dishes, and not in the dish they were sent from the table in, unless cleaned. Some housewives send warmed-up food to the table in the same dish in which they were warmed, which is always untidy. A dish which is presentable at table should not be subjected to the heat required in cookery, excepting, of course, pie and puddiug dishes.

STARCH POLISH.—Take common dry potato or wheat starch sufficient to make a pint of starch when boiled. Then add half a drachm of spermaceti, and add half drachm of white wax, and then use it as common starch, only using the iron as hot as possible. In this manner a brilliant polish is produced. Epsom salts have also been recommended for use in starch. To each bowl of starch add one teaspoonful of Epsom salts, and dissolve in the usual way by boiling. Articles starched with this it is said will be stiffer and will be rendered to a certain degree fire-proof.

SWEET POTATO BALLS.—First boil the potatoes, then carefully mash the farinaceous part. Boil in the meautime a pint of milk, put in some lemon peel, a couple of small lumps of sugar and a little of salt. When the milk boils, take it off the fire and add the potatoes, so as to form a pasts, or rather a tolerable thick mush. Wheu cool, make it into balls; cover these with crumbs of bread and yolk of egg. Fry these to a nice browu color and serve them up with sugar stewed over them.

THE RISDON
Iron and Locomotive Works.

INCORPORATED.....APRIL 30, 1868.
CAPITAL.....$1,000,000.

LOCATION OF WORKS:
Corner of Beale and Howard Streets,
SAN FRANCISCO.

Manufacturers of Steam Engines, Quartz and Flour Mill Machinery, Steam Boilers (Marine, Locomotive and Stationary), Marine Engines (High and Low Pressure). All kinds of light and heavy Castings at lowest prices. Cams and Tappets, with chilled faces, guaranteed 40 per cent. more durable than ordinary iron.

Directors:
Wm. Alvord, C. J. Brenham, C. E. McLane,
Wm. Norrie, Wm. H. Taylor, Lloyd Tevis,
James D. Walker.

WM. H. TAYLOR.....President.

Varney's Patent Amalgamator.
These Machines Stand Unrivaled.
For rapidity pulverizing and amalgamating ores, thoy have no equal. No effort has been, or will he spared, to bave them conetructed in the most perfect manuer, and of the great number now in operation, not one has ever required repairs. The constant and iucreasing demand for them is sufficient evidence of their merits.
They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.
This Amalgamator Operates as Follows:
The pan being filled, the motion of the muller forces ths pulp to ths eenter, whers it is drawn down through ths appertura and between the grinding surfaces.—Thence it is thrown to the peripbery into the quieksilver. The curved plates again draw it to the centor, where it passes down, and to the circumference as before. Thus it ie constantly passing a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powdor, and ths metal amalgamated.
Setlers made on ths same principle exesl all others They bring the pulp so constantly and perfectly in contact with quicksilver, that tbe partielos are rapidly and completely absorbed.
Mill-men are invited to examins thsee pans and setlers for thomselves, at ths office, 229 Fremont Street, San Francisco.

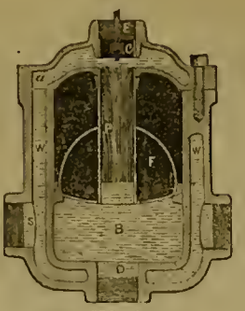
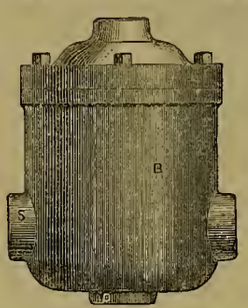
CRAIG & BREVOORT'S
Patent Condenser for Steam PUMPS, &c.



NO. 1.

The annexed engravings represent a Condenser intended to be attached to the ordinary steam pump, thereby bringing it within the class of low pressure, or more properly speaking, of condensing engines; the steam, when it has done its work in the cylinder, instead of being exhausted into the atmosphere, is conducted to the condenser, on its entry into which, it meets the water drawn by the pump, and is immediately condensed.
The Cut No. 1 represents a vertical section of the Condenser, and No. 2 an elevation.
The flange D is bolted to the suction orifice of the pump, and the flange S to the pipe leading to the well, or whatever source of supply the pump may have; W is a water jacket surrounding the main chamber of the condenser, B, and with which the suction pipe, S, communicates, permitting a free circulation of water within the jacket and into the hollow cover or top through the series of openings, one of which is shown at A, and from thence into the body of Condenser, B, through pipe P, carried by float F; the pipe P also acts automatically as a valve to enlarge or contract the space through which the water enters it, by which means the possibility of the condenser being at any time flooded is avoided. The pipe P, it will be observed, also acts as guide to float F.
The valve, C, (shown in Cut No. 1), which is raised or lowered by means of screwed stem—shown coming through elbow in Cut No. 2—is for the purpose of increasing or decreasing the flow of water according to the capacity of the pump to which it is attached.



NO. 2.

The exhaust pipe from steam cylinder is screwed into cover at E; the exhaust steam is thus thrown directly into contact with the water entering the condenser on its way to water cylinder of pump through D. A vacuum being of course immediately formed, acts on the exhaust side of the steam piston, aiding it in its work. If at any time it is desirable to run the pump without the condenser, it is only necessary to turn the three-way cock, which is placed in the exhaust pipe, into such a position as to cause the steam cylinder to exhaust into the atmosphere; when this is done the pump is perfectly free from the condenser, and acts as if it were not attached. This condenser is specially useful for pumps running in mines, or any other position where trouble is experienced in getting rid of the exhaust steam. Address H. L. BREVOORT,
6v23eowly 128 Broadway, New York City.

CORRECTED CERTIFICATE.—The Western Lancet Publication Association filed another certificate of incorporation with the County Clerk on the 30th in lieu of the one filed some time ago, in which the name was erroneously given as the *Pacific* Lancet Publication Association.

Mining Accidents.

James McCormick, while working in the 200-foot level of No. 3, in the Meadow Valley mine, fell through the side or trap door at that level, and down the shaft to the 280-foot level. He died in a few hours from the injuries received.

T. R. Warren, while hoisting with a block and tackle at the Idaho mine on Saturday last, was severely injured by being struck on top of the head by a block of wood weighing about seven pounds.

While raising a 3-ton boiler up the oañon to the shaft of the Eclipse mine, for the hoisting works, on the 15th inst., a chain gave way and the boiler rolling back some 30 ft. badly injured Isaac Jackson. But for the fortunate interposition of a block of wood, he would have been killed instantly.

ORE SAMPLED.—The following lots of silver ore have been crushed and sampled during the month of Jannary, 1872, by J. W. Thurman, No. 413 and 415 Mission street, (formerly Howlaud & Co).

From the Arizona mine, Humboldt District, Nev., three lots respectively, 70,53 and 81 sacks; 41 sacks from the Sheba mine, same dist; 111 sacks from Golconda mine, same district. Two lots of 61 and 37 sacks from the Wallapai mine, Prescott dist., Arizona; 112 and 66 sacks from Sacramento dist., Arizona; 15 sacks from Prescott dist., 110 from Benjamin mine, same dist. Two lots of 40 and 80 sacks from Mexico. All these lots of ore are high grade, running from $300 to $5,000 per ton, and were purchased and sent to Liverpool, with the exception of one small lot.

There were also sampled 170 sacks of copper ore from the Ella mine, Nevada, and two lots of 200 and 140 sacks from Battle Mountain, which were also sent to Liverpool.

LEATHER.—The proprietors of the Pacific Tannery at Stockton shipped last week 5,000 pounds of skirting and harness leather to Los Angeles, and 8,000 pounds to this city to be re-shipped to Japan.

San Francisco Metal Market.

[Corrected weekly by Hooker & Co., 117 and 119 Cal. street.]

Rainfall at Sacramento.

[By T. M. LOGAN, M. D., Secretary State Board of Health.

Jan. 17, 1872. Rainfall for the season to date..16.451 inches
" 30, " " from Jan. 23 " " ...0.020 "

Total for the season up to Jan 23, 1872.....16.471 Inchs.

REMARKS.—The above small amount, added to the previous rainfall, was not actually the result of rain; but the measurement of mist or fog collected in the rain-gauge. In fact, during the prevalence of the light northerly winds, which prevailed from the period of our last report up to the 23d, when a heavy norther set in, we have been immersed, in the lower part of the valley, in a sea of fog, while those in the more elevated regions have been basking in the general sunshiue.

Besides so many new facts and the large amount of useful knowledge derived through these official sources, the mining public are likely to find in the recently published work of J. S. Phillips a valuable teacher and assistant. This book, which treats in an intelligent and practical way on almost every topic connected with mining pursuits, should be in the hand of every millman, metallurgist, prospector, and miner on the Pacific Coast. Even the capitalist, and, in fact, every person already engaged in, or likely to become interested in the business of mining, will find in this comprehensive work an amount of information that they cannot afford to dispense with.—[Commercial Herald on Geological Survey, etc., Jan. 26th.

MARAVILLA COCOA.—No breakfast table is complete without this delicious beverage. The *Globe* says: "Various importers and manufacturers have attempted to attain a reputation for their prepared Cocoas, but we doubt whether any thorough success had been achieved until Messrs. Taylor Brothers discovered the extraordinary qualities of 'Maravilla' Cocoa. Adapting their perfect system of preparation to this finest of all species of the Theobroma, they have produced an article which supercedes every other Cocoa in the market. Entire solubility, a delicate aroma and a rare concentration of the purest elements of nutrition, distinguish the Maravilla Cocoa above all others. For homœopaths and invalids we could not recommend a more agreeable or valuable beverage." Sold in packets only by all Grocers, of whom also may be had Taylor Brothers, Original Homœopathic Cocoa and Soluble Chocolate Steam Mills—Brick Lane, London. Export Chicory Mills, Bruges, Belgium. fe25-1y

The Evangel, Office, 414 Clay street, San Francisco. Terms, $4 per year, in advance. THE EVANGEL is the organ of the Baptist Denomination for the Pacific States and Territories. Of the SCIENTIFIC PRESS can be had from January 1, 1854, to date, at $3 per single vol. or $6 a year. They afford the cheapest and best information on mining and the industry of this coast of any work published.

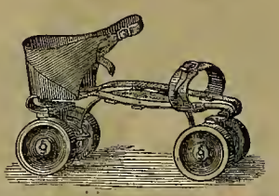
The C-Spring Roller Skate.

PATENTED 1871.



Rights and Skates for Sale.

This superior Skate is now beginning to attract the attention of Rink Owners, it belng the only Cramping Skate now before the public (except the Plympton Skate) that can run without infringing a former patent.

This Skate is Positively no Infringement

Of anyhody's patent. It is made in the most substantial and workmanlike manner, and possesses the following points of merit: Beauty, Elasticity, Ease of Movement, Strength, Lightness, and does not injure the skating floor as much as the ordinary skate.

Every pair Warranted to be just what it is represented. Parties intending to

START A RINK,

Should examine and test this Skate. Sample pairs sent C. O. D. on application.

In ordinary samples state the number of boot or shoe worn, and whether for lady or gentleman.

☞ For City, County or Rink Rights, call on or address WIESTER & CO.,

No. 17 New Montgomery street (under Grand Hotel), SAN FRANCISCO.

A NEW BOOK.

The Explorers', Miners' and Metallurgists' Companion.

The Most Practical and Comprehensive Work on Mining Subjects Extant.

Comprising 640 Pages and 81 Engravings.

BY J. S. PHILLIPS, M. E.,

Of San Francisco, a Practical Operator for Thirty-four Years; Explorer, and Resident in the Pacific States and Territories for the past Six Years.

Now issued and for sale by DEWEY & CO., Patent Agents, Publishers "Scientific Press.

Comprisiug a Practical Exposition of the Various Departments of Exploration, Mining, Engineering, Assaying, and Metallurgy.

Geological Formations of the Primitive Earth, its Secondary Rocks, its Mineral Veins, Minerals, Metals, Coal Fields, Etc., Etc.

General Composition and Peculiarities of Mineral Veins; Their Comportment with Each Other, and with Cross Courses, Dikes, and Slides.

Geological Characteristics of the Most Extensive Miuing Districts.

Exploration for, and Examination of, Mineral Veins.

Discrimination and Assay of Minerals, by the most Available and Practical Methods.

Mining and Mechanical Engineering, Above and Below the Surface, for Dressing of Ores, Deep Mining, Etc.

Assorting, Crushing, and Concentration of Ores.

The Best Methods for Reducing the Minerals and Metals to a Marketable Condition, by Roasting, Milling, Chlorinizing, Smelting, and by Chemical Treatment.

The Continually Recurring, Unnecessary Errors, in Mining and Metallurgy.

PRICE, bound in cloth, $10 (in coin or its equivalent). In leather, $12. Postage, 50 cents extra. Address all orders (wholesale or retail) to

DEWEY & CO.,

Scientific Press, 338 Montgomery street, San Francisco.

HILL'S PATENT EUREKA GANG PLOW,

The undersigned, Manufacturers of "HILL'S PATENT EUREKA GANG PLOWS," take this method of calling the attention of Agriculturists throughout the Pacific States and Territories to the merits of the above named Plows, and offer the following reasons why they are entitled to preference over any other Plow in use.

They are made of the best material, and every Plow warranted.

They are of light draught, easily adapted to any depth, and are very easily handled.

They will plow any kind of soil, and leave the ground in perfect order.

FIRST PREMIUMS!

These Plows took the First Premium at the State Fair in Sacramento, in 1870; at the Northern District Fair in Marysville, 1870 and 1871; and at the Upper Sacramento Valley Fair, Chico, 1870 and 1871. At the Mechanics' Fair, held in San Francisco in 1871, a Silver Medal was awarded these Plows; and the State Agricultural Society, at the last Fair, offered a premium of $40 for the best Gang Plow. The committee was composed of practical farmers from the agricultural counties, who, after a fair test and thorough competition with the leading plows of the State, awarded the premium to the Eureka Gang Plow. From this it will be seen that these celebrated plows still maintain their reputation over all competitors. Patented Sept. 7, 1869.

Champion Dsep-Tilling Stubbls Plow,

which took the First Premium over all competitors at the State Fair, 1871. It turns a furrow 14 inches deep and 24 inches wide.

This Gang Plow combines durability with cheapness, being made entirely of iron by experienced workmen, of the best material. Over three hundred are now in use, and all have given entire satisfaction.

Manufactured and for sale at the corner of Third street and Virgin Alley, Marysville, by

HILL & KNAUGH,

And also by most leading Agricultural Dealers in the State. All others are invited to apply at once for Circulars, prices, etc. 16v23-tf

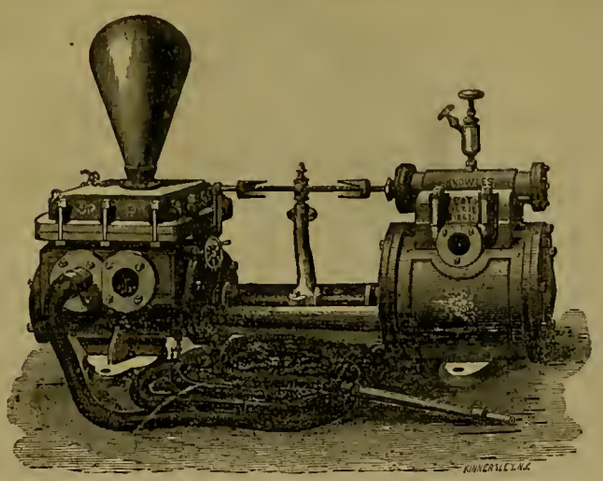
Office, No. 409 California street, (up stairs) San Francisco, Cal. jr27-3t

KNOWLES' PATENT STEAM PUMP.

Awarded First Premium and Diploma

Over all Competitors, at Mechanics' Institute Fair of San Francisco, 1871; also Special Medal and Diploma at State Fair.



It has no Cranks or Fly-Wheel, and has no dead points where it will stop, consequently it is always ready to start without using a starting-bar, and does not require hand-work to get it past the center. Will always start when the steam cylinder is filled with cold water of condensation.

The trial of Steam Pumps at the Eighth Industrial Fair in San Francisco, by a Committee of Five of the most thoroughly practical mechanics on this coast, showed the Knowles Pump to lose but 11⅓ per cent., while others lost as high as 40 per cent., showing great difference in economy.

CENTRAL PACIFIC R. R., OFFICE OF THE GEN'L MASTER MECHANIC,
SACRAMENTO, Cal., April 14, 1871.

A. L. FISH, Esq., Agent of the Knowles' Steam Pump, San Francisco—Dear Sir: In reply to your inquiry as to the merits of the Knowles' Steam Pump, in use upon this road, I will say that we have nineteen of them in use on this road as fire engines, and pumping water for shop and station use. I consider the Knowles Steam Pump the best in use, and prefer it to any other. Yours truly, A. J. STEVENS, General Master Mechanic.

WE BUILD AND HAVE CONSTANTLY ON HAND

THE LARGEST STOCK OF PUMPS IN THE WORLD,

And for Every Conceivable Purpose.

A. L. FISH, Agent.

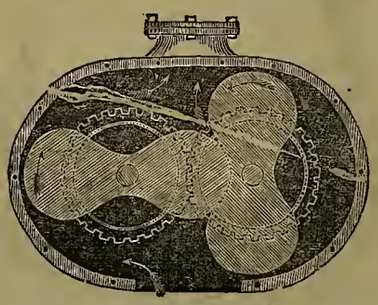
ROOT'S PATENT FORCE BLAST ROTARY BLOWER.

MANUFACTURED AT

The Globe Iron Works, Stockton, Cal.

AWARDED THE FIRST PREMIUM AT THE PARIS EXPOSITION—PATENTED NOV. 1, 1864; JULY 24, 1866; AND OCT. 9, 1866.

Adapted FOR Smelting, Foundry, Mining and Steamships.



Requires 50 Per Cent. LESS POWER Than any Blower Now in Use.

One of these Blowers may be seen at W. T. Garratt & Co.'s Brass Foundry, San Francisco; Gould & Curry and Savage S. M. Co.'s, Nevada; and at C. P. R. R. Co.'s Works, Sacramento; and other places on this coast.

CAUTION.—Purchasers will find it to their advantage to apply direct to the Stockton Agency, as certain parties, not authorized to manufacture the Blower, have put in the market machines of inferior construction, which do not answer all the requirements of the genuine article.

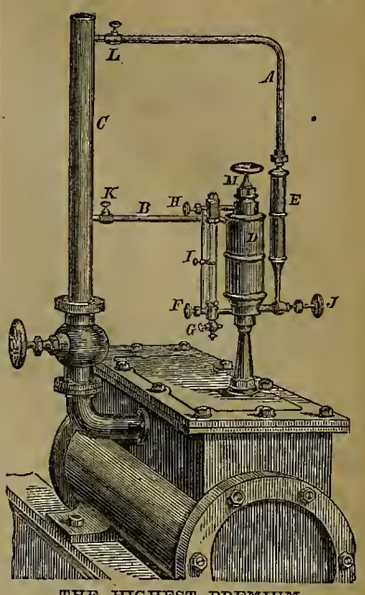
Machinery.

N. Seibert's Eureka Lubricators.



THE HIGHEST PREMIUM

Awarded by the Mechanics' Institute Fair, San Francisco, and State Fair, Sacramento, 1871.

These Lubricators are acknowledged by all engineers to be superior to any they have ever used; feed constantly by pressure of condensed water, supplied by pipe A, regulated under the oil by valve J, and forced out through check valve and pipe B into the steam pipe C; it then becomes greasy steam, passes to all the valves and cylinder at every stroke of the engine; glass tube I indicates amount used per hour. Packing on rods and stems lasts longer, and the rings on the piston will not corrode. One pint of oil will last from three to six days, according to speed and size of engine; I, sliding gauge; K, valve to shut off when engine stopps; H, F, valves to shut off in case of frost; steam does not enter the cup; it is always cool; warranted to give satisfaction. Patented February 14, 1871. Manufactured by California Brass Works, 125 First street, S. F. 24v23tf

---

WHY THE WILSON

Patent Steam Stamp Mill

IS THE BEST AND

Most Desirable Mill for Crushing Ores.

Because the company give a responsible guarantee that the purchasers shall be under no expense for repairs for TWELVE MONTHS, and guarantee the mill to crush (regular work) One Ton Per Hour of the Hardest Quartz through the ordinary screens.

THERE IS A SAVING

of from Twenty to Forty per cent. running expenses.

To put one of the Wilson Mills over the mountains, from $10,000 to $18,000 is saved in First Cost.

The Wilson Mill will save in working expenses and repairs enough every six months to PAY FOR ITSELF.

IN EVERY PARTICULAR

This Mill is Greatly Superior to the

Ordinary Cam Stamp Mill.

RECOLLECT

This Mill is Fully Guaranteed

to do and be all we claim for it.

DO NOT BE DECEIVED

by the cry of "Humbug," but call and investigate its merits. One can always be seen at the Pacific Iron Works.

Ten of these Mills are now in operation.

For further particulars address

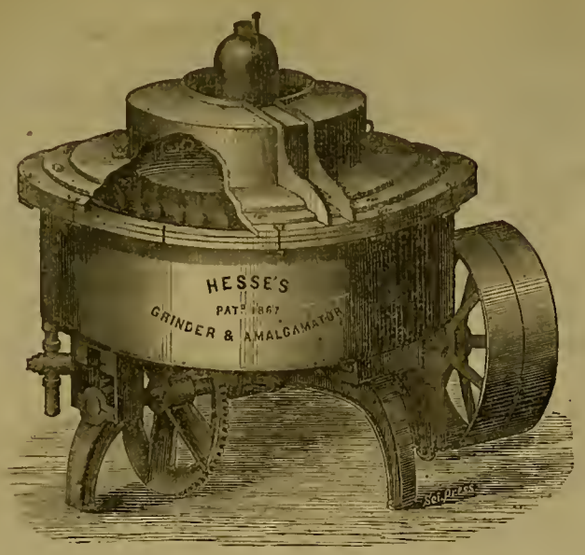
Pacific Iron Works,

In this city, under the Patents of Farrar & Whiting.

17v23-3m GODDARD & CO.

THE HESSE GRINDER AND AMALGAMATOR.



This machine is the most complete and desirable grinder and amalgamator now in use. Owners of Quartz Mills and Sulphuret Works will find it greatly to their interests to use this machine. The following are some of its many advantages, viz: The comparatively little power required to run it; the small wear of metal in comparison with other grinders; the large amount of work that may be accomplished in a given time, being about three times the amount usually performed in ordinary pans; the continuous working process, whereby the labor of handling the ore is avoided; the peculiar arrangements and action of the currents in the machine, whereby all the particles of ore are brought in contact with amalgamating surfaces, and are discharged as soon as ground to the required degree of fineness, thus saving an unnecessary waste of power and metal.

IN THE REDUCTION OF SULPHURET ORES,

this machine is especially valuable, the particles are ground exceedingly fine and uniformly sized, which greatly facilitates the concentration of the sulphurets, and leaves them in the best condition for roasting. The Hesse machines are successfully working in several important quartz mills and sulphuret works in this State. For further particulars send for Circular, or apply to

LORD & PETERS,

e11-tf 304 Battery street, San Francisco, Cal.

I. N. WILFONG'S

PATENT CIRCULATING

STEAM BOILER.

This cut represents an improvement on the old style of Cylinder Boiler, and combines all the following great advantages: Rapid circulation and generation of steam; economy in fuel; durability, safety, and simplicity of construction; requires but little attention; is easily repaired, and moderate at first cost.

We have now a number in successful operation, and respectfully refer to the following well known parties: Hastings & Co., Seventh and Cherry streets; Jos. Lea & Co., 128 Chestnut street; J. S. Huber, Germantown; Holt & Bro., Sixth and Susquehanna avenue; Albion Print Works, Conshohocken, Pa.; S. H. Dickey, Oxford, Pa.—all of which are giving ENTIRE SATISFACTION. Parties wishing to investigate the success of our new Boiler can do so by calling at any of the above named places, or to

AMBLER'S BLOWPIPE FURNACE,

For Roasting Rebellious Ores.

This new roasting furnace is the CHEAPEST AND BEST yet offered to the public. By furnishing an ample supply of oxygen to the ore while roasting, thorough oxydization of the sulphurets is secured at a small cost.

It is Adapted to All Kinds of Ores.

A description and illustration of this Furnace was given in the Scientific Press of November 25th.

For terms, circular, and further information, address the agent of the inventor,

MONROE THOMSON,

At 444 California street, San Francisco, until further notice. 5v23-3m

The Scientific Press,

Established in 1860, is now the Largest, Most Original, Best Illustrated and most Ably and Carefully Edited Practical Mining Journal on the Western Continent. Its contents are made up of fresh intelligence in a condensed and interestiug style, easily appropriated by the reader, who finds its columns replete with new facts and ideas not obtainable in the books of the past or in any one other of the journals of the day.

Varied in its carefully compiled and convenieutly arranged departments, representing the special and leading industries of the Pacific States—Mining, Mechanism, Manufacturing, Building, Improvements and Inventions—it becomes a weekly iuformant to all Scientific, Mechanical, Manufacturing and Industrial Progressionists on the coast, an immense list of whom testify to its pleasant, profitable and elevating influence.

The progress of our journal has been steady and unvarying. Enconraged by a liberal class of readers who exhibit their appreciation in a substantial way, we shall, with our increasing facilities, experience and information, make each coming issue superior to its predecessor.

Let every friend of Science and Industry on this side of the continent take pride, not only in sustaining, but accelerating the advancement of a faithful representative of its highest interests by subscribing for it and nrging its patronage by others—now, without delay.

Subscription $4 a year, in advance. Address

BETTS'S CAPSULE PATENTS.

To prevent INFRINGEMENTS, NOTICE IS HEREBY GIVEN, that BETTS'S NAME is ON EVERY CAPSULE he makes for the principal merchants in England and France, thne enabling vendor, purchaser, and consumer, not only to identify the genuineness of the Capsule, but likewise the contents of the vessel to which it is applied. The Lord Chancellor, in his judgment, said that the Capsules are not used merely for the purpose of the ornament, hut that they are serviceable in protecting the wine from injury, and insuring its genuineness.

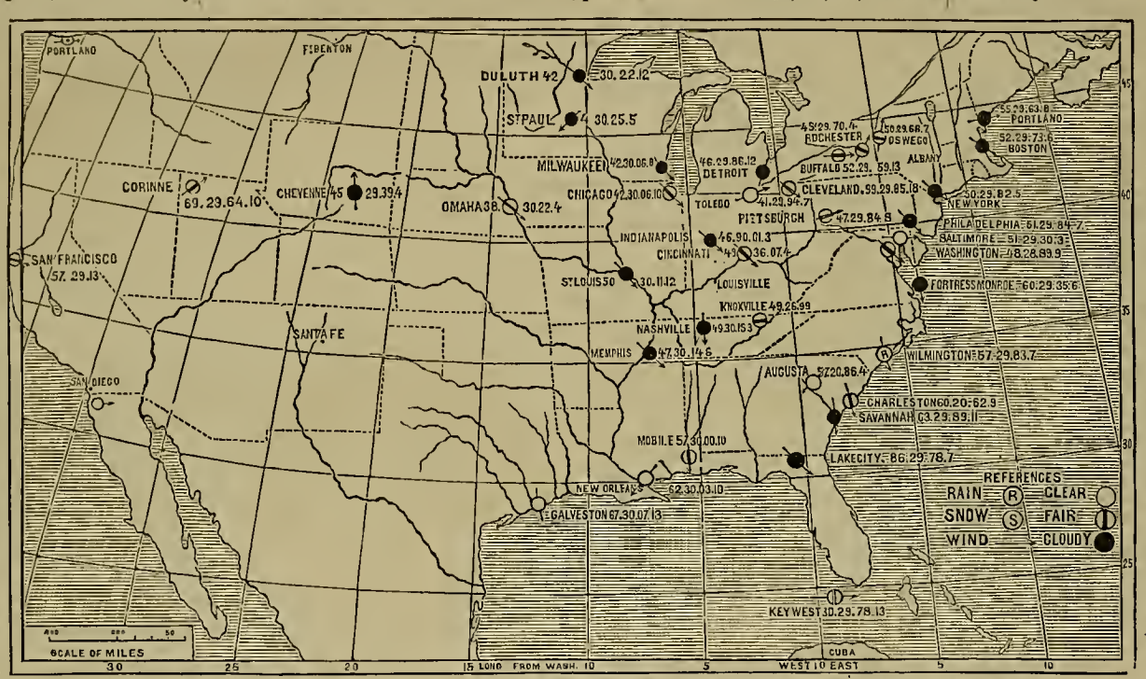
SAN FRANCISCO, SATURDAY, FEBRUARY 10, 1872.

VOLUME XXIV. Number 6.

United States Signal Service.

In our issue of January 6th, we gave a sketch of the extended system of meteorological reports, which has recently been introduced by the War Department at Washington, for the benefit of navigation, and the people generally, and alluded to the ability and general plan of the system. To-day we are enabled to give a specimen of the weather map which is daily published in Washington and several other of the principal cities of the Union, and which will convey to the reader a more definite idea of the character of the information given, and the facility with which it may be presented on a map. The accompanying map is a *fac-simile*, on a reduced scale — a portion only of the stations being given — of the one published September 27th, 1871. This map can be prepared at any station from the regular weather reports which are first transmitted from the several stations to the chief station at Washton, and there tabulated and sent out as a whole, to all the chief commercial and business cities of the country.



SPECIMEN OF THE WEATHER MAP AS DAILY PUBLISHED BY THE UNITED STATES SIGNAL SERVICE.

The use of the characters indicating rain, snow, clear, fair and cloudy will be readily understood; the arrow flies with the wind; the figures placed in immediate connection with the characters are explained as follows: The first figures show the state of the thermometer; the middle four figures show the velocity of the wind in miles per hour; the absence of the arrow and figures showing velocity of wind indicate calm weather.

The popular belief in man's ability to forecast the weather is as old as history, and "weather sharps" have always been met with in every community, savage or civilized. But it is only since the telegraph has enabled a single observer to extend his observation, simultaneously over an immense region of country, that weather predictions have been reduced to something like a science. By the aid of the telegraph the observer at Washington, is enabled to become informed of the existence of a storm, a thousand miles or more away, to study its motions and characteristics, and thus mark out its future course and give the necessary warnings to be prepared for its coming. Although the Signal Service has already proven of immense practical value to commerce, for the advance of which it is more especially intended, it is as yet by no means claimed that sufficient data have been collected to establish it as an exact science; but it is believed that the system now inaugurated, will, if faithfully persevered in, lead to developments which will be far more useful than it now is to the public.

FOR THE PROTECTION OF MINERS.—The following bill was recently introduced in the Assembly for the purpose of protecting the health and lives of miners. The first section reads as follows:

Section 1. It shall not be lawful for any corporation, association, owner or owners of quartz mining claims within the State of California, where such corporation, association, owner or owners employ twelve men daily, to sink down into such mine or mines any perpendicular shaft or inclines beyond a depth from the surface of three hundred feet, without providing a second mode of egress from such mine in case of fire or other accident that might occur to the main shaft or incline.

The remainder of the bill requires all mine owners included within the first section, to commence to sink an additional shaft to connect with the main working level. If any mine owner or corporation shall fail to provide for the proper egress, and any accident shall occur on that account, the owner or corporation shall be liable for damages, and when death shall ensue, the heirs or assigns of the deceased may maintain action for damages under "the Act requiring compensation for causing death by wrongful act, neglect or default, approved April 26th, 1862." The law shall take effect six months after its passage.

THE snow blockade still continues, but the postmaster here expects to receive an Eastern mail to-night.

The Excitement in Stocks.

The Stock Brokers have had quite a lively time of it for some days. Ever since the announcement on the evening of the 2d inst. that a rich body of ore had been struck in the Savage mine, which carried that stock up and influenced many others, California street has been in a high state of excitement. On Saturday the sales at a single session of the San Francisco Stock Exchange Board, amounted to the large sum of $1,300,000 and with the sales in the new Board and on the street the total for the day is estimated at $2,000,000. Of course a number of the sales were on time. Monday's transactions were thought to have amounted to the unprecedented sum of $3,500,000, and on Tuesday the sales at the morning session alone aggregated a million dollars during a three-hours session. The mines that have appreciated in value within the past few days are principally on the Comstock lode. There is little doubt that considerable bodies of fine ore have been recently discovered in mines located on the lode, but there is not much reason to suppose that dividends can be declared in proportion to warrant the wonderful advance that certain stocks have taken. However this is a matter of opinion, and people when they get excited in stock operations seldom wish to be warned or advised as to their investments, still it will be well perhaps to call the attention of our readers to the experiences of 1863 and the White Pine fever, and suggest that if they have any spare dollars safely lodged in the savings bank, to let them rest there and trust in the legitimate increase, rather than risk hard earned savings in "stocks" with the hope of sudden fortunes.

It is of course to be hoped that the rich developments said to have been made are matters of fact and that the mines which have so materially increased in value will prove themselves worth the highest prices paid for them. Thus far however there are no means of judging of the facts for want of reliable information on the subject.

California Academy of Sciences.

The regular meeting of the Academy of Sciences was held on the 5th inst., and the following named gentlemen were elected resident members: Dr. J. Bluxome, Dr. C. M. Bates, John O. Earle, C. A. Wetmore, Henry Carleton and O. D. Munson. Eight new members were proposed.

Due notice having been given, the consideration of the following addition to the by-laws was taken up and adopted:

Resolved. That the officers of this society are prohibited from incurring any indebtedness on behalf of this society, unless authorized by the Board of Trustees, or by a vote of the Academy at a regular meeting.

Donations.

F. Emile Durand presented a combination of sulphate of baryta and sulphate of lime, taken from the Redington quicksilver mine, in Lake county; also, two curious crystallizations of oxide of zinc, reproducing the coral form, and showing how near crystalline form can reproduce the appearance of organized bodies.

The Secretary announced the receipt of 61 specimens of bird skins and a variety of seeds from the New Zealand Academy of Sciences in return for a collection of California cones sent to them.

The subject of inviting inventors to produce their inventions, with a general discussion of their merits before the Society, was discussed, but it was considered unnecessary so to do as the Society had dropped the word "Natural" from its corporate name with a view of extending its sphere of usefulness by permitting discussions on all branches of Science.

Dr. Cooper announced that the Mechanics' Institute had tendered for the use of the society, at a moderate rent, the upper floor of its building, which would much better accommodate the Academy than the rooms now occupied.

SACRAMENTO VALLEY BEET SUGAR COMPANY.—This company with a view of largely extending their operations, propose to increase their capital stock—which is now $100,000—to $200,000, and have given notice for a meeting of the stockholders for that purpose. This does not look much like a backing down of the new enterprise, and we congratulate the stockholders of the company on their successful endeavors to place this valuable industry, on a permanent and paying basis.

CORRESPONDENCE.

Mining and Other Matters in Montana.

EDITORS PRESS:—Having occasion to pay a visit to Meagher County, the past week, I heg the privilege, as your occasional correspondent, to jot down some items gleaned during my trip to that iuteresting portion of our Territory. In company witb a friend we sleigbed from Helena to Staffordsville—formerly Cañon Ferry, on the Missouri river, about 18 miles distant. The ferry appurtenances were there, but we crossed the river upon ice 16 inches thick, and were glad to arrive at the hospitable door of mine host, Capt. Stafford. Around his genial hearth we met several honest miners, sturdy ranchmen, and stockmen, wbo were "snowhound"—all enjoying tbe indoor comforts, the more pleasureable hy contrast with the severe cold and deep snow without. We tarried a day and gathered much valuable information for the PRESS from the weather-bouud visitants.

A Snowless Region.

From Mr. Weatley Basey we learued that about 900 head of cattle had heen driven from the Deep Creek country—when the snow was two feet deep—to the Mussle river—where there is no snow, only about 30 miles distant eastward. About 1,100 remained, and the ranchmen were proposing to remove the remainder to that section.

It is passing strange that whilst all over the Territory so much snow has fallen and now lays upon the ground, about two feet on a general level, that the portion of country alluded to extending over many miles, should he exempt. The bunch grass was 18 inches high, seeded, and nutritious, and thousauds of cattle could he wintered there, safe from the voracious wolves, and in danger only from the possible appearance of vast herds of huffalo which were in the Judith basin, or might at any time cross the range to that inviting paeture.

Desirable Locality.

The captain has one of the most inviting, romantic, and profitable locations in Moutana. It is the concentrating point for the miners and rauchmen; whilst, as he informed us, 30 or more strangers have found comfortahle heds with bim during this present "cold spell." He will have a new wire rope soon, to span the river—which is 500 feet wide just helow the cañon. We noticed two or three yoke teams busy hauling saw-logs to the mill from the adjacent hills—which gives employment to a dozen or more men, choppiug timher. When they came in at night they seemed to be men of

"Happy yesterdays, and confident to-morrows."

The cackling of hens, cooing of pigeons, equealing of numerous swine, and lowing of the herds as they come in from the foothills, reminded us forcihly of Gray's celebrated elegy, and, altogether, presented a picture of this far-off mountain country, which in comfort and pleasantness would not suffer by comparison with any portion of our higbly-favored land.

We were also informed that the Trout Creek Ditch, which has been in progress for the past two yeare, will surely be completed early this epring, and will give employment to a large numher of miners, as it is estimated that at least 600 acres of hench placer mining will he brought into productiveness. The capacity of the ditch is 1,000 inches, and length 14 miles.

After the warm parting greetings and a "sleigh cup," the next morning, early, with eleigh-hells jingling, we dashed off up the valley. The snow outside of the well-beaten tract was about 2½ feet deep. We passed several ranchos on the way; the houses were comfortahle looking, and around the large ricks of hay and straw-etacks the cattle in great numbers were grouped, seeming to be well cared for.

Blackwell's Station or Glenmore.

After a two hours drive of twelve miles over the crisp snow, we arrived at the hospitable home of the Messrs. Blackwells—Glenmore, we named it, formerly called Blackwell's Station. Here, in the wintor time, all travelers, helated or otherwise, find all the comforts of the aristocratic English farmer's warm welcome, with fire places as large as their hearts, cosy heds, groaning tables, and a welcome so hearty that tbe frost at once melts from our heards and we indeed feel "at home."

Tbis rancho needs more than a passing notice. Ahout five years ago four poor English boys with their aged parents settled here, and have, hy their own industry and energy, now an inviting home and the largest aud most productive farm upon the Missouri valley. The land lays just along the foothills which here are very precipitous, and extend outwards and along the high hench of land overlooking the river from a distance. It is watered hy White's gulch. The system of irrigation adopted here is the most complete we bave seen. They have about 200 acres in cultivation and will add more next year; tbey had 80 acres in wheat, which yielded 30 bushels to the acre; the wheat is the Chili and Cluh wbeat, and makes splendid flour. It is perfectly free from smut and every other impurity. Their oat crop yielded 40 husbels to the acre and weighed 40 lbs to the hushel, and is of the "Surprise" variety. The grains are almost as large as the celebrated Montana rye. Their potato crop yielded 200 hushels per acre.

The stock upon this farm looked better than any we saw, as they had good shelters and an ahundance of hay and straw. The horses and cattle bave lived for the most-part upon the hunch grass growing upon the steep declivities of the hillsides.

In my next letter I will write about matters, etc., in and about Diamond City.

EAOLE QUILL.

Helena, Montana, Jan. 17, '72.

Inyo County Mining Matters.

EDITORS PRESS:—Having missed your correspondent "Crowquill's" letters from the columns of your valuable paper, for some time, I thought I would take up the cudgel and drop you a few notes of the doings of our couuty. Winter has set in iu earnest. The mountain ranges on either side of the valley of the Owens river are covercd to the depth of several feet with snow; and times are looking brighter for the miners and furnace-men and for everybody in general, than they have for some months previous. The furnaces in Cerro Gordo, Swansea, and Lone Piue, (Cervantes) are in full blast.

The Kearsarge Co.

After au expenditure of nearly $40,000 through mismanagement and ignorance in amalgamating the ores, have closed their lahore for the season with liabilities of ahout $20,000; for which an attachment rests upon the property. It seems strange that, with the amount of capital this company has invested, that when they get a man in their employ that *does* understand the amalgamation of tbeir ores, and make a profit to the compauy, that a few dollars more or less, in the shape of salary, should deprive them of his eervices—yet such is the fact.

The Eclipse Co., duriug the present season, have completed 30 stamps in their new mill and have them runuing, and under correct managemeut, this will he a success.

A Tramway and Hoisling Works.

A tramway 2½ miles in length connecting the mine with the mill is nearly completed and is a great saving even now, in the transportation of the ore; hut will he of vastly more saving when connected with the tramway of the incline shaft of the mine.

Steam hoisting works are now in course of erection at the mouth of the mine, which, when completed will add to the profits of the working of the different ores contained in this mine.

Something Unusual

Is to he seen in this mine. Directly under the hanging wall is a belt of argentiferous galena, sub-lying which is a helt of silver-bearing quartzite, similar to the ores of Cerro Gordo, and of equal richness, whilst underneath, the ledge is composed of gold-bearing rock, and which is worked hy mill process for tbe free gold it contains. The whole ledge being nearly 9 feet in thickness. Mr. A. J. Close of this place is now erecting a emelting works for this company, on the same plan in use in other parts of this county, which will be in running order by the 20th of Jan., 1872. The furnaces are of about the same capacity as those of Mr. W. Belsbaw & Co. of Cerro Gordo.

Waucoba District.

This district is attracting considerable attention at present, so in view of that fact I think a description will not he amiss in this place.

The district is named after one of the Indian chiefs of that section and was located by Mr. I. Freehorn & Co., some three years ago. It is situated 30 or 40 miles east of Independence, on the eastern slope of the Inyo mountains and contains an ahundance of wood and water and is destined to he a formidahle rival to Cerro Gordo in the smelting reduction of its ores; the veins being chiefly of the hase metal order.

The Mines of Cerro Gordo

Are improving in extent and richness daily. A rich strike was made in the Wittekind a few days ago.

The Omega Tunnel Co. have struck a heavy mass of galena in tbeir tunnel and are ruuning it to the surface as fast as posihle.

The Santa Maria Mill has just heen sold by the Sheriff for the sum of $101,000 to Mr. P. W. Bennett, to satisfy a judgment in his favor for $97,000 and costs of suit, and is now being worked to its fullest extent hy Mr. B. & Co.

EXILE.

San Diego Mines.

EDS. PRESS:—Since my last letter, we have had quite a miniug excitement, in fact, greater than we have ever experieuced in this camp hefore. After the rich clean-up of the Big Blue Co., many

Prospectors

Visited that locality, which is situated half a mile east of the Helvetia, to hunt for the extension; they did not prospect long until the Bush brothers struck a very rich deposit or ledge, said to he richer than the Big Blue; then Mr. Puntney, from San Felipé, found another near hy, for which the Bush boys paid him $50, he having worked on it only one day. M. A. Lewis found auother rich deposit or ledge, on which he pounded out $27 from four pounds of rock, and the Bush hoys paid him $400 for his claim to prevent any conflict of title; this raised a big excitement, and for many days Big Blue Hill had from 100 to 150 men on it prospecting, a numher of whom found and located rich deposits of quartz. Some half dozen tunnel sites have heen located, and tunnels commenced for the purpose of runuing into the hill to strike the main ledge, which everyhody supposes is the origin of the rich float rock and slides which ahound in this vicinity. The Bailey hrothers in San Felipé Cañon, have completed their large overshot water whcel, which works like a charm, running their small five-stamp hattery, crushing four tons of ore per day from the

Ready Relief,

Which is paying well. It is the southern exteneion of the Redman mine; the boys are in a fair way to realize a fortune; they run the ore in cars within ten feet of the hattery, have a ledge six or eight feet wide, and it costs them but a trifle to crush it; they first burn the ore in a furnace uear the battery; they do all their own work in the mine and mill, so that the returns from the ore are nearly clear profit; the mine is looking well, showing free gold in a great deal of the ore. The hoys say they are working on the 500 foot level, as they have the face of the hill hefore them and quartz all the way to the top, about 500 or 600 feet above them.

Mr. A. W. Whitney has got a large new pump in the Redman mine and hopee to have no further difficulty in keeping the water out, so they can take out rock without further detention.

From the famous

Golden Chariot

Ledge the company are still taking out the richest ore ever eeen in tbe country, and packing it to Whitney's Mill, where they are sure of getting ahout $200 per ton. The last crushing returned ahout $190, and they are confident that the ore now heing taken out is better than any ever taken out hefore; tbe ledge is large, beiug from six to nine feet. All of our other mines are looking well as usual.

Climate, Etc.

In my last letter I promised to say eomething of the climate of San Diego county, but I am so crowded for time and space, I will only tell you what I have seen, and then your readers can draw their own conclusions. On the 12th day of December I was in San Diego City and saw a lemon, just cut from a hush only two years old, full grown and of the largest size. On tbe road down to the city I saw farmer gather his second crop of potatoes from tbe same ground, yielding 200 husbels per acre. Now the hills are covered with flowers, all over Julian and Banner Districts. We have had copious showers of rain, and farmers are in high hopes of a plentiful harvest, such as they have not had for tbree years past. In consequence of the three years drouth tbrough which we have just passed, the ahove facts will give your readers a hetter idea of our climate than all I could say in a long letter.

L. B. H.

Julian City, Jan. 20.

Mining in Placer and El Dorado.

EDITORS PRESS:—Having just returned from Placer and El Dorado counties, I am prepared to say tbat the miners were never in better spirits, and good cause have they for heiug juhilant. Water is abundant, and the piles of dirt which accumulated during the dry seasons prove rich, and the lahor of past years is meeting its just reward.

In and ahout Auhurn there rages what might be called a "quartz fever," and the hopes would seem to be not at all misplaced. A numher of Sacramentans are interested in the Ella quartz mine, in El Dorado county, ahout two miles distant from Auburn station. The *Union* of a late date referring to the discovery of this ledge, says:—"In November last, J. J. Orr, wbile out deer hunting, discovered the croppings and told his friend, George W. Paget, and they together with Samuel J. Hunt, determined to organize a company to develop the claim."

Some flood, prohahly in '52 or '62, washed off five or six acres of land and opened the ledge about 500 or 600 feet below the croppings. The Ella claim is situated on a point of land tendiug to the North Fork of the American River. Tbe ledge is 3,000 feet long and six feet wide, with a shaft sunk to the depth of 30 feet. There are fifteen stockholders, each holdiug 200 feet. The stockholders are Hart Fellows, G. W. Paget, J. J. Orr, M. T. Brewer, John H. Johnson, Samuel L. Hunt and others, all Sacramentans. The rock from this ledge yields $50 to the ton. The Ella claim is two miles iu a southwesterly direction from the celebrated Great Crevice mine at Murderer's Bar, which yielded more tbau half a million of dollars in the palmy days of '49 and '50, when Col. J. C. Potter and other well-known Californians had fingers in tbat auriferous pie. New steam machinery, now etored in this city and intended for the Great Crevice, will he forwarded to Murderer's Bar as soon as the roads are in good condition.

The farmers in this, Yolo, Sutter, and all adjoining counties, are in excellent spirits and hard at work. Everytbing looks promising for a bountiful harvest—and a good time for everybody. You bave no doubt noticed the interesting and cheering report made day before yesterday hy the Directore of the State Agricultural Society.

REFLEX.

COMSTOCK ORE.—Ore is now being extracted from the 1200-foot level of the Belcher and Crown Point mines, says the Territorial *Enterprise*, which is precisely the same as the rich black sulphuret ores that were found in former times in the Gould and Curry, Ophir and Mexican mines. We again eee the old familar black sulphuret epecimens passed from band to hand or exhibited in cabinets of yore. It would seem as though we are now passing into a new zone in our mines, a zone in which the black sulphuret ores are again to predominate as they at first did in that at present known. Whether or not this may be the case, it is quite certain that we are just beginniug to make the acquaintance of our mines. A hundred years hence the workers on the Comstock will doubtless laugh at our preseut perplexities, shortsightedness and childish misgivings.

THE Thames tunnel, thought to he such a novelty, was anticipated by one under the Euphrates at Babylon, and the ancient Egyptians had a Suez canal.

IVORY.—If ivory hecomee brittle hy age, it will recover its original quality by being hoiled in a solution of pure glue.

MECHANICAL PROGRESS.

Friction Gearing vs. Belts and Cog Wheels.

Experiments in the use of friction gearing—that is, of pulleys transmitting power, by direct frictional contact between the smooth faces of the driving and the driven pulley instead of by means of belts or by cogs meshing into each other—have been very frequently made, and in many cases with remarkable success. So emphatic, are the recommendations of this method of gearing, given by men who have tried or witnessed its operation, that it is somewhat a matter of surprise that it has not been more generally adopted. It is claimed by many such persons to be equally well adapted to the propelling of gang, mulay or circular saws, mill hurrs, or in fact almost any description of machinery, and to the transmission of any amount of power with the same or even greater useful effect than when belts or cog wheels are employed.

In the vicinity of Clinton, Iowa, some years ago, friction pulleys were introduced in a saw-mill with such complete success in point of economy and convenience, that they soon became an established institution throughout that entire region, superceding belts altogether, the latter being in some instances thrown out at a heavy expense to give place to the new order of things.

The pulleys used in this case were built of soft and tough wood, strongly put together by their segments in such a manner as to present the least possible end grain of wood to the surface. They were placed on the main shaft, to which the power was applied by the engine crank or taken from the water wheel, as the case might be, in the ordinary manner. The faces of the pulleys were either parallel to the shaft or beveled at any angle required, according to the direction of the counter shafts to which the power was communicated. The segments of the pulleys were glued or painted together and their faces turned off perfectly true. It was found that they required about one-third more width of face than would be necessary if belts were used. In one case, two gangs were run, each with a friction pulley three feet in diameter and having 24 inches face. For a mulay or rotary saw mill, a pulley of from 12 to 16 inches face was found sufficient. A friction pulley, ten inches in diameter with six-inch face, was described as giving more useful effect and heating the boxes less than when the same pulley was used with a four-inch belt. From the numerous experiments made, the conclusion was reached that a pulley of 20 inches face would successfully transmit 50 horse power without undue wearing or heating.

The special advantages claimed for this method were the saving of the expense of providing belts and loose pulleys and keeping them in repair. The mills were so arranged that each machine was run with its own counter shaft, geared either to the engine shaft or to one of the main counter shafts so that each workman could control the operation of his own machine independently of the others, and with no throwing off or putting on belts. The pulleys on the counter shafts were of iron and very strong, each having the same face, of course, as the driving pulley, but being of any desired diameter, according to the motion to be obtained. By means of a movable bearing operated by a lever, the iron pulley was readily brought in contact with its driver, the motion necessary for this purpose being less than one-eighth of an inch.

The statement that, for the proper working and durability of a friction pulley, it should be so made as to present as little end grain as possible to the surface, is emphatically disputed by experienced workmen, who claim that the precise opposite to this is the true method, and that the pulley should be so made as to offer the end grain to the contact of the other pulley to the utmost practicable extent.

To accomplish this purpose, the pulley is made of segments of wood, cut out of a plank in the shape of a fan, the grain running parallel with one side of the fan, and the end grain being represented in a slightly oblique manner at the outer or circular edge. These segments are put together strongly, and so arranged that the grain shall not run in the same direction in two pieces in contact with each other, but cross in much the same manner as the furrows in the upper and under millstone. The object of this is to prevent the face of the pulleys from too great tendency to wear in any given direction.

The rim of the wheel, as it may be called for convenience, is built up by laying the first tier of segments, making a complete wheel of the thickness of the plank, flat upon the bench, and placing the other layers successively upon this, breaking joints and crossing the grain as already indicated. The layers are very strongly secured to each other with wrought nails, beside which glue or white lead is laid on between them. The rim being complete, mortises or gains are made to receive the pads of the spider at the end of the radial arms, these gains being somewhat larger than the pads, and the space thus given being filled by the insertion of keys, one on each side of the pad, entering from opposite directions and overlapping each other, the whole length of the pad. Bolts are also inserted, passing through the pad in a radial direction, with countersinking on the face of the pulley and a nut on the inner end. The countersink is afterward filled by plugging, over the head of the bolt.

The conflict of testimony in regard to the comparative efficiency of the pulleys in which the end grain is presented to the surface and those in which it runs lengthwise with the circumference is somewhat surprising, as the point is easily subjected to a practical test. Most mechanics will take ground without hesitation in favor of end grain, as less liable to yield and curl or "broom" up, when subjected to powerful and constant pressure.—*Leffel's Mechanical News.*

ROLLING IRON.—Nothing is more noticeable than the various changes which have been made in the method of finishing iron in rolling mills during the last five years. A few years ago our mills furnished all their iron in bars, sheets, rails, or such shapes as were demanded by separate establishments. Of late the iron manufacturers have added to their mills other branches of iron working, which can be done by them at much less cost than by those who were simply purchasers from the mills, and who lost considerable in the shape of "scraps" in working up the iron in various articles. Said "scrap" was necessarily brought back to the mill again and sold at a greatly reduced rate. Thus it will be seen that the rolling mill that finishes the iron direct into nuts, bolts, horse shoes, washers, railroad chairs, etc., possesses a great advantage in making these articles, which are beginning to be viewed as a part of the rolling mill business. Galvanizing sheet iron, making gas pipe, strap hangings, and many other things are now made by rolling mills with more profit to themselves and the public, than by the old method. Properly managed, the finishing of iron into these and other articles cannot fail to prove profitable to the manufacturer.

TESTING COTTON GINS.—A series of interesting experiments have been proposed at Manchester, England, for the purpose of testing the merits of the various cotton gins, for working different kinds of cotton, or separating the fibre from the seed. The points to be determined for each gin, and in respect to each variety of cotton are:—First—the speed of working, as tested by the time in which a given quantity of seed cotton can be ginned; second—The facility of working as tested by the quantity of power consumed in the operation; third—The quality of working, as tested by the condition of the ginned fibre and the separated seed respectively. In order to make the experiment as conclusive as possible a series of very ingenious regulations have been framed to exclude the possibility of any kind of error or deception. Three principal classes of gins have been entered for competition namely, the roller gins, knife and roller gins, and saw gins. Such tests might be made with many other kinds of machinery, much to the advantage of the public and to all really meritorious inventors.

AERATING WATER.—A contrivance of recent date for aerating water produced from the condensation of steam, comprises a tank with a series of porous or open work partitions, some containg wool and felt, with the spaces between filled with coke and chalk. The last compartment has a perforated bottom, through which air is forced and rises in minute bubbles.

FROM an interesting article in a recent issue of London *Times*, we learn that steam cultivating machinery is coming into very general use in England. One large firm have been sending out from eight to ten plowing engines per week, most of which are for use in districts where they can be hired by several different farmers.

SCIENTIFIC PROGRESS.

The Permanent Gases.

It is a generally received opinion that all gases are mere vapors of liquids that boil at very low temperatures. Thus, while water boils at 212°, common ether boils at 96°, and sulphurous acid at 0°. Consequently, while water is always a solid or a liquid, in all parts of the earth, ether would be a permanent gas in any place where the highest tropical temperature prevailed, and sulphurous acid is always a gas except in the cold of the polar regions. Even mercury, when exposed to a temperature sufficiently high, becomes transparent gas, and carbonic acid gas, when exposed to a temperature sufficiently low, becomes first a yellowish liquid, and then a beautiful, snow-white solid. The only difference, then, between common snow and carbonic acid snow is that the one is much colder than the other, while, on the other hand, the only difference between carbonic acid gas and mercury gas is that the one requires a higher temperature for its existence than the other.

There are certain gases, however, which no degree of cold yet reached has reduced to the liquid, far less to the solid form. Prominent amongst these are oxygen and hydrogen—the gases that, combined, form water. But after it had been observed that intense cold tended to reduce all gases and vapors to the liquid form, these gases were cooled with freezing mixtures; still they remained in the gaseous state, although mercury became solid, and alcohol, unless very pure, became thick and pasty. After a time, a still more powerful freezing mixture (liquefied laughing-gas) was discovered, and by a powerful steel pump was forced into a large iron receiver until it became liquefied with the pressure. When a little of this liquid was poured into the air, it evaporated, and produced the greatest degree of cold ever observed—257° Fah. Even then, oxygen and hydrogen did not liquefy, but maintained their condition as clear and beautiful gases.

But cold alone was not the only agent brought to bear on these gases. They were subjected to immense pressure, far exceeding anything with which we are familiar in ordinary life. Natterer constructed a series of very finely made steel pumps. With one of these, he condensed one of the gases into a strong vessel until it occupied but the three-hundreth part of its original bulk. Then, with a still more powerful pump, he condensed this already dense gas, so as to reduce it still further. It will readily be seen that, by employing gas in a condensed state, it was much easier to force it through the valves of the second pump than if gas at the ordinary pressure had been used. In this way, by working with gas gradually increasing in density, he finally obtained a pressure of 3,000 atmospheres, or 22½ tons to the inch.

If we have no idea of a temperature of 257° below zero, neither can we fully grasp the enormous pressure expressed by the figures 22¼ tons per square inch. Most solid substances would be crushed to powder under such a pressure as this. And yet to this wonderful pressure did Natterer subject oxygen and hydrogen. But even that temperature and pressure made no impression on them, at least so far as change of form is concerned.

But that which Natterer, aided by all the resources of modern science, failed to do, chemical affinity does instantly and perfectly. Mix the gases in proper proportions and bring the smallest flame into contact with them, so as to produce ignition, and they will instantly rush together with a loud report, combine and form a perfect liquid, water. It is perfectly obvious that the elementary atoms of this new liquid water, must be held together by a force sufficient to overcome their expansive force. We have seen what this expansive force is capable of resisting, and consequently we can form a comparative estimate of the power of chemical affinity.—*Condensed from Phin's Chemical History.*

VOLCANIC ERUPTIONS.—Archdeacon Pratt, by discussing the amount of precession in a globe with a molten nucleus, finds conclusive evidence of Sir Wm. Thompson's opinion that the earth is solid, and that, therefore, volcanic eruptions are attributable to some other cause than the one popularly assigned. His view is confirmed by numerous recent observations, which indicate that the increase of temperature, below the earth's surface, soon reaches a limit.

THE SAND BLAST.—The uniform success which has attended the use of the sand blast has sufficiently proved its reliability, and the numerous purposes to which it can be applied, promise to render it one of the most useful inventions that have been of late brought into public notice. By simple modifications it can be made to supercede the present slow and costly process for shaping granite and other hard stones, for rock drilling and for polishing castings, or grinding and engraving glass. The cost of working it is extremely small and there need be no loss of the sand employed, as it can be constantly restored to the feeding hopper, together with the particles driven from the material.

The action of the sand upon a hard surface appears to be due to the work performed by each angular particle that strikes, and which in striking carries away with it a particle, of course far smaller than itself, and the reason why the softer materials resist the wearing action, is due to the elasticity which repels the particles. As a proof of this, it may be mentioned that while perforated shield plates of lace, gelatine, or rubber bear a prolonged exposure to the sand, unharmed, stencils of thin sheet steel or brass curl up, and are destroyed.—*Engineering.*

THE PNEUMATIC SEWAGE SYSTEM in which air is the power employed for cleaning the sewers of matter otherwise likely to accumulate, is discussed with much interest by some of our foreign exchanges. The plan is to divide a city into complexes and sub-complexes, a sub-complex consisting of about 200 houses, and a complex comprising all the sub-complexes within a radius of 2,500 feet. Each complex has a large air-tight cast iron reservoir, and each sub-complex a small one connecting with the main reservoir and with the houses, by means of pipes provided with valves and cocks, by which all circulation of air may be prevented. The air inside is exhausted by means of a large air pump driven in connection with the main reservoir by means of a powerful steam engine, and then the outer air, pressing upon the contents of the pipes, forces them into the reservoirs. By this means the pipes may all be cleared in less than five minutes, their contents first passing into the sub-reservoirs, and then into the main one. This simple and eminently sanitary system has for some time past been in successful operation in the city of Prague, Bohemia, and is being introduced into other European cities.—*Ex.*

ACCURACY OF TELEGRAPHIC ESTIMATES OF LONGITUDES.—The great accuracy with which differences of longitude can be ascertained by the magnetic telegraph is illustrated by some of the determinations for the United States Coast Survey. Where the longitudes were estimated by four different circuits, the greatest difference between any two determinations was twenty-eight thousandths of a second, equivalent to about *thirty feet*, the mean error being less than one millionth of the distance between the two objective points, which, in some cases, as in that between Cambridge and San Francisco, was 3,580 miles.

NEW USE FOR ELECTRICITY.—Electricity has achieved a new triumph. Already employed to restore vigor and nimbleness to the gouty limbs of decrepit *bons vivants*, the recent discoveries of Dr. Bernier, a French physician, show electricity to be an efficient remedy for the evil effects of excessive drinking on the human nose. The doctor maintains that, by the application of an electric current to noses even of the most Bacchanalian hue, the flesh may be made "to come again as the flesh of a little child;" and he supports his assertion by a case performed on a female patient of his own, a woman of high rank.—*Sci. Am.*

THE FOSSIL PLANTS OF CANADA.—Dr. J. W. Dawson, of the Geological Survey of Canada, has just published his report on the fossil land plants of the Devonian and Upper Silurian formations of Canada. In this report, he has catalogued or described more than 120 species of land plants found in formations older than the carboniferous in Canada, thus placing the knowledge of this old flora in advance of that of any other portion of the world.

A NEW MODE OF FORMING PERFECT CRYSTALS.—Prof. Schultzs states that by the use of gelatinizing liquid as a solvent, crystals of various substances may be obtained completely formed. In proof, a number of fine crystals of sugar, borax, etc., were shown, which had been formed in suspension in gelatine and other solutions.

MINING SUMMARY.

THE following information is condensed mostly from journals published in the interior, in close proximity to the mines mentioned.

California.

AMADOR COUNTY.

KENNEDY MINE.—Amador *Ledger*, Feb. 3d: In company with Mr. Ginocchio, Pres. of the Co., we visited the mine, a few days ago, and while there examined the rock being taken from the lower, or 500-ft. level, and can safely state that better average rock cannot he found in any mine in the county; every piece we examined on the dump showed free gold, and was well charged with gold bearing sulphurets. The ledge in the lower level, is 13 ft. in thickness, and the entire body is of the same value as the rock on the dump. The rich stratum struck last week, continues equally as promising as when first discovered.

LINCOLN MINE.—The Lincoln Mine, at Sutter Creek, is yielding richer rock than at any previous period. The last clean up of 14 days run in a 20-stamp mill, yielded $5,400 in clean gold. The main shaft has reached 300 ft., and in sinking, the rock increased in value $3 per ton in the last 60 ft., with the most favorable indications of further increase of value as the shaft reaches greater depths.

PLYMOUTH. — Cor. same: The Phenix (formerly the Hooper mine) is once more in a prosperous condition. New and substantial hoisting works have been built, the old shaft cleaned out and re-timbered, and good paying rock found at the lower level, 500 ft. below the surface. They are sinking, with a good prospect of a continuous paying ledge.

Adjoining the Phenix on the north, is the Alpine mill and mine. A fine 10-stamp mill, with hoisting works attached, was constructed about one year ago, and is in running order. They are sinking on this mine with good prospects ahead. The shaft is down 250 ft.

Enterprise, is a small village, 3 miles north of this place. One mile northeast from Enterprise, is the Philadelphia and mine; a substantial 20-stamp mill was built on this mine, last fall, and is running on low grade ores. Half a mile west from the village, is the Condo and Wilson mine, which bids far to excel all others in this vicinity for richness; a shaft has been sunk 150 ft. and the rock taken out has paid from $12 to $25 per ton with plenty more of the same sort in sight. The Enterprise mill and mine are half a mile east of the village; a large amount of money has been expended in the attempt to develop a paying mine, but so far without success. This mill has been doing custom work for the different mines in this locality, but is not running at present.

Several other quartz mines of smaller note are located in this vicinity and awaiting capital to develop them.

CLINTON.—Amador *Dispatch*, Feb. 3d: The placer mines in the vicinity of Clinton appear to be yielding with renewed vigor since the late rains. A surface claim near that place yielded 14¼ ozs. as a result of one day's work for 3 men, a few days ago.

WHEEL BROKE.—A large cog-wheel on the end of the cam-shaft of the Kennedy mill was broken to pieces last Sunday, while the mill was under full headway. The mill will be started again as soon as a new wheel can be obtained, which will be in the course of a few days.

CALAVERAS COUNTY.

GOOD ROCK.—Calaveras *Chronicle*, Jan. 2d: We have seen some very fine specimens of rock taken from the Thorpe mine, at Fourth Crossing, 35 tons of which yielded $500. The lead continues to widen as they go down, and the character of the rock improves steadily.

COMMENCED WORK.—Richards, Griggs & Dower who recently instituted a hydraulic on French Hill, near town, have got fairly to work. They have been "piping" most of the week.

ZACATARA.—On Tuesday, Mr. Bateman showed us a quantity of specimens taken from the shaft, which for richness we have never seen surpassed. The ledge varies from 18 inches to 3 ft. in width, and the pay streak will average fully 2 ft. He estimates that the rock will yield $75 per ton if the entire lead be taken out from wall to wall. The shaft is now 137 ft., from the bottom of which a level has been run a short distance. There is an 8-stamp battery on the mine, run by water power. The mill has been recently repaired and will be ready to commence crushing in about 10 days.

GREAT YIELD.—Five tons of quartz from the mine of Teusch & Mitchell of Mosquito Gulch, yielded $700—an average of $140 per ton. The rock was worked in the Harris mill at Sandy Gulch. Teusch & Mitchell are down 75 ft. on their lead, the ledge showing 3 ft. in width. The pay chimney is known to be 40 ft. in length, having been prospected that distance.

HUDSON QUARTZ MINE.—Active operations are to be immediately commenced. The mine is situated at Central Hill in this county. It was located by P. Davis who sunk a shaft upon it 50 or 60 ft., developing a remarkably wide ledge of gold-bearing rock. Mr. Davis sold it to an English Co. of capitalists. Since the transfer hut little or no work has been done, an effort to let a contract for sinking the shaft having failed. During the past week, D. M. Hosmer, agent for the Co., has made arrangements for the immediate commencement of work.

GIGANTIC GRAVEL ENTERPRISE.—A Co. has been formed in S. F., for the purpose of engaging in gravel mining in this county. The first of the series of operations in view will be the opening of a hydraulic claim on Central Hill, about 5 miles from this place, and preparations are being made for that purpose on the most extensive scale. Water is to be conveyed to the ground through 1,500 ft. of 11-inch pipe, and all the appointments for working the mine will be first-class. The Co. have other enterprises of a similar nature in view.

BARTOLO MINE.—J. A. Lefoy, of this place has made arrangements for working the old Bartolo quartz mine, near West Point. Mr. Lefoy will clean out the old shaft and sink it deep enough to thoroughly prospect the ledge.

EL DORADO COUNTY.

NEW DIGGINGS.—Placerville *Democrat*, Feb. 3: New and rich diggings have been discovered on Tanner's Ranch, near Ringold, Diamond Springs Township. They are regular '49 diggings.

ROUGH AND READY.—Grass Valley *Union*, Feb. 1: Brown Bros. claims, on the head water of Squirrel creek, are being constantly worked.

The Baltic Co., on the north side of Randolph Hill are piping with good results. The ground looks well, and paying results are sure to follow a clean up.

At the Webster Co.'s mines old tailings are being washed. This employs 3 men and the pay is from 2½ to 3ounces of clean gold for each day.

The Red Jacket below Rough and Ready is prospecting for gravel, and has found rich blue gravel in the claims.

McSorely & Co., are not mining, a flume having washed away during the heavy rain storms and lumber for repairs not being obtainable.

The Portugese Co., below Rough and Ready are at work with paying results.

On Goshen Hill (Black & Landis claims) no work is being done at present.

REVIEW.—The Eureka mine is being prospected for pay rock which gave out between the 5th and sixth levels. The mill is running 15 stamps and the explorations are being made to the west on the ledge.

The Empire Co. is running a 20 stamp mill, and employing 36 men by day and 21 by night. They are taking out 20 tons of quartz per day.

Perrin's mine is being worked continually, rock from the east paying $50 per load and from the west $100 per load.

The Grant mine, near Perrin's, is running. The rock generally pays $80 per ton, and the yield of the last crushing averaged $40 per ton.

The Greenhorn mine is running day and night. The ore is good hut they have yet had no clean up.

The Branch Mint Co. are running a tunnel from Gold Flat which is in 70 ft., and will in time be 300 ft. below the surface.

The Heuston Hill mine is worked by 13 contractors. The last crushing of 10 loads paid $1,045.60. The rock pays $100 to the ton.

Daisy Hill mine has a new engine of 8 inch cylinder. The last crushing yielded $6,500 from 42 loads. The ledge is 2 ft. thick.

The Seven-Thirty is flooded. The last crushing yielded $500 from 13 loads.

The Idaho mine paid last year $232,500 in dividends and is averaging about the same in yield this year. The new shaft will be ready for use about Sept.

The North Star mill and machinery has been thoroughly repaired and the mine is paying regularly.

The Coe mine is to be sold. The ledge is one of the finest in the dist.

The Town Talk mine yielded $3,000 during Jan.

DARTMOUTH HILL.—Grass Valley *Republican*, Feb. 4: The Dartmouth will commence lifting its stamps on Wednesday next. It has some good looking gravel cement on its dump pile.

SAN DIEGO COUNTY.

JULIAN CITY.—By Telegraph—Feb. 3: last week, the clean up of the Gunn & Reynolds mill gave the following results: 27 tons from the Bush Boys' lead yielded $1,575, an average of $58.33 per ton; 12½ tons from the Lewis mine yielded $875, an average of $70 per ton; 13 tons from the Big Blue lead, yielded $1,501.50 an average of $115.50 per ton.

SAN BERNARDINO COUNTY.

RICH ORE.—San Bernardino *Guardian*, Jan. 20: Some time ago Brunn & Roe shipped to S. F. 30 sacks of ore, 3,240 lbs, from the "Lizzie Bullock" mine in the Clark dist., which netted $2,200. It assayed at $1,565 per ton, on which lot of crude bullion, at 80 per cent., they received $1,300 per ton.

SIERRA COUNTY.

POVERTY HILL.—Cor. Downieville *Messenger*, Jan. 27: The mines look very encouraging; Kingdom Bro.'s have already washed away a claim or more of ground, and are continuing to send the gravel away with great rapidity. Westall, Hughes & Co. have been during the past summer, repairing ditches, constructing new flumes, hydraulics, etc., besides keeping a full crew of men working in the tunnel, which is nearly ready to commence operating through. This tunnel is near 2,000 ft. long, running through the hardest of rock the entire distance. J. A. Huhbard has struck a natural opening through the rim-rock which he has followed some 70 ft., and found blue dirt and the bed-rock pitching. He has every indication to insure his future prosperity. Mr. Huhhard has recently run some drifts into the south side of his diggings, and found a bank of blue gravel from 4 to 12 ft. deep, and a very flattering prospect.

YUBA COUNTY.

SMARTSVILLE.—Cor. Grass Valley *Union*, Jan. 30: All of the paying mines are at Sucker Flat and Timhuctoo—particularly the former. At Sucker Flat, they have begun work hut recently, and so have not begun to develop their mines yet.

BLUE POINT MINE.—They have stripped off the white cement to such an extent that where it terminates in the hillside the face of the hank is 160 ft. high. They have done hut little work comparatively in the blue gravel. From a hole probably 200 ft. long by 250 wide and 100 ft. deep, they have taken $250,000, $80,000 of which is clear profit, besides what is now in the flume, which must be about $70,000 more, as they have been hydraulicing for about 6 weeks without cleaning up. The tunnel through which they wash the dirt cost the Blue Point Co. $150,000.

The Blue Gravel mine is not as well developed as the Blue Point is, hut it is on the same lead, and just as rich.

The Smartsville mine is pretty well developed. They have stripped off a large amount of the top lead, and are enabled to make runs that will average from $30,000 to $40,000.

The Enterprise is the only remaining mine that is working now.

At Timhuctoo the mines are nearly all worked out, when compared with those of Sucker Flat. The Water Co's. claim is the most extensive there. There is 165 ft. of the old top lead standing, and under this a very thick stratum of white cement and blue gravel. At some points the blue gravel has been found that is over 80 ft. thick, and when they run on this kind of dirt, they average from $1,500 to $2,000 a day with the flume. The mines are good for 40 or 50 years, to all appearance.

Nevada.

ELKO COUNTY.

BULLION. — Elko *Independent*, Feb. 3: For Jan. the hullion shipment from Cope dist. was $18,896.74.

COPE AND BRUNO DISTS.—Cor. same: McGlaughlin & Co. have thrown up their contract to siuk on the Mardis ledge on account of the depth of the snow. The above ledge was discovered last summer by Mr. Mardis. The rock on top was very rich, but on sinking the quality and amount of pay ore has greatly deteriorated. The Norton mill is running steadily and with good results. The El Dorado and Excelsior are being thoroughly worked. The Independent mine is being put in order for spring work. They will put on an additional force of 20 men. There are hut few idle men in camp.

EUREKA DISTRICT.

STILL WORKING. — Eureka *Sentinel*, Feb. 2: The furnaces of the Eureka Cons. are turning out bullion in large quantities. The amount produced during the past month will equal any previous month's run in the history of the Co. The mine produces an average of 125 tons of ore daily.

ELY DISTRICT.

BULLION.—Pioche *Record*, Jan. 25: W. F. & Co. shipped since Jan. 21st, bullion valued at $15,624,21.

PEAVINE.—There is plenty of $200 ore in sight and the title is good.

PANACA FLAT.—Every claim is being worked by the owners. Most of them have struck good pay.

RESERIVER.

STAR OF NEVADA S. M. Co.—Reese River *Reveille*, Jan. 27: This is an English Co. recently organized for the purpose of working a series of ledges lying in Union Hill.

The present workings are prosecuted through the old tunnel, started some years ago. It penetrates the hill 410 ft. It being driven ahead by contract, and will be continued till all the ledges of the Co. have been cut. It has already cut 3 ledges, each of which will be fully developed.

A level 300 ft. long has been run from the tunnel on the first ledge, exposing a body of good ore averaging 6 inches in width the entire distance. The last crushing of ore from this ledge—produced nearly $1,500 per ton, for the first class and over $300 per ton for the second class.

Three sections of this level, on the north side of the tunnel, have been leased to as many parties.

The first lease (the one nearest the tunnel) is held by McCool & Co., the second by F. Massey & Co., the third by S. Kelly. All are sinking on the ledge, which still holds good.

The Co. are opening and working this level on the south side of the tunnel.

Garrison & Co. have lately secured a lease on the second ledge cut by the main tunnel, and have just started work on a level.

The manager of the Co. has given a lease to G. Emerson & Co. who are hard at work preparing to sink a shaft from the surface of the hill some distance from the line of the tunnel.

About 300 ft. from the mouth of the tunnel the management are erecting hoisting works for the purpose of sinking a 300 ft. shaft, through which the greater part of the workings will thereafter be carried on.

In the hore house are about 15 tons of a good quality of ore.

MURPHY M Co., have concluded to take the property at Ophir Cañon which was bonded to them several months ago, consisting of the Murphy, McDonald mines. Since the bond was given the ledges have been thoroughly prospected, and from developments already made, bid fair to become one of the best paying properties in Eastern Nevada. P. S. Buckminster has a force of 50 men already at work getting out rock, and the mill will be started up as soon as the necessary repairs can be made.

WASHOE.

BULLION.—Virginia *Enterprise*, Feb. 1: We yesterday saw at the Bank of Cal. $48,000 in silver bricks from the Crown Point.

MAGNIFICENT BODY OF ORE.—The drift east from the south section of the Crown Point, 1,200-ft level, 105 ft. north of the Belcher line, is in 112 ft. All this distance it is in splendid ore, with no sign of the east wall as yet.

STRIKE.—There was much rejoicing yesterday at hearing of the develcpement of a fine body of ore in the Savage, south of the shaft, on the 1,400-ft level.

ANTELOPE DIST.—H. J. Mann, last evening visited our sanctum and exhibited to us some very rich specimens of gold-bearing quartz from the vein upon which his mill is running. Antelope dist. is about 80 miles southeast of Wadsworth, and 18 miles south of the old Overland Station of Westgate. The Antelope ledge is owned by the California G. M. C., and is from 18 inches to 3 ft. in width. A shaft is down upon the lead to the depth of 70 ft.. The mill is 6 miles southwesterly from the mine. It contains 5 stamps, with room for 5 more, and an engine large enough to run 15 stamps. The ore pays from $30 to $50 per ton, and the hullion produced is worth $16.50 per oz. The gold is 884¼ fine. They have a well 30 ft. in depth, containing 14 ft. of water, from which they run their mill. Wood is fifteen miles distant, hut is abundant. A few days since, at a point 600 ft. distant from their main shaft, they found a deposit in their lead which is much richer than that they have been working. A specimen shown us was full of coarse gold, and would assay away up in the thousands. The other ledges of note in the dist. are the Moun-

tain Sheep, Champion and Lexington. Fourteen men are employed at the Antelope mine and mill, and in all, there are about 30 miners in the dist.

Sierra Nevada.—A rich strike has been made of what appears to be a back vein, which is much richer and more promising than anything ever struck in the mine. The new deposit is in the works advanced farthest to the northwest and is separated from the white lead in front by a considerable thickness of a sort of conglomerate of porphyry and a well-defined clay wall. The rock is much darker than that in the front vein and presents much more the appearance of regular Comstock rock. While $5 per ton is as high as the front vein has ever assayed in silver, this new deposit goes as high as $29. It appears, in addition, to be very much richer in gold than the front vein, free gold being visible to the naked eye in many specimens. Upon the new deposit a winze has been sunk 30 ft., and from the bottom of this a cross-cut has been made which shows the body of ore to be 25 ft. in width. A sample of ore from the deposit, which we saw washed out, showed a very large prospect of beautiful bright free gold, much of which was in coarse round pieces. At a point about 60 ft. south and some 40 ft. higher up, a second drift was yesterday just cutting into what seems to be the same deposit. As yet only the ore that was dug from the winze and cross-cut has been extracted, as the new strike is at a considerable distance, by way of a narrow and crooked drift, from the nearest ore chute.

Belcher.—The Belcher Co. have found a large and rich deposit of ore at the south end of their explorations, in a cross-cut west from their south drift. In the extreme south end of this drift the ore appeared for a time to have almost given out. The drift seemed to be following the direction of the vein, and what to make of the jumble of porphyry and quartz into which it suddenly ran no one knew. Shortly before a point or promontory of hard west county rock was passed, and this seemed to have turned the vein to the eastward, therefore the drift was pushed in that direction until it ran into the poor rock mentioned above. Suspecting at length that after passing the promontory the vein might have swung round it back to the westward, and that their drift had been going diagonally across the vein, a cross-cut was started west. The conjecture proved correct, and last Saturday the cut began to enter ore, and has continued in good ore ever since, proving the presence of a large deposit at that distance south. Ore taken from the face of the cross-cut yesterday assayed $125 per ton.

WHITE PINE.

East Shenoygan—White Pine *News*, Jan. 27th: There is a force of 10 men prospecting and putting the mine in shape for spring operations. The southeast drift from the original tunnel is in 18 ft. since last report. There is a good body of ore with a fair showing of born silver. Exchange incline is down 10 ft. deeper than when last reported. Running on a spar seam, with a fair prospect for ore. The Regent drift running from the Regent shaft to connect with the Exchange incline, has made 13 ft. headway since last report. Three tons of ore are raised daily and piled on the dumps.

San Juan del Rio.—The foreman reports the mine looking as usual. The ore pitches at an angle of 45 degrees and assays from $245 to $60 to the ton.

Eberhardt.—In last week's report mention was made of a shaft going down on the end of the West drift for the purpose of testing the depth of ore. Since then work was suspended on account of snow blocking up the mouth of the tunnel leading to the dump. Work will be resumed as soon as it is possible to remove the ore piled up in the drift.

North Aurora.—The ore-body in the south drift from the Lady's chamber is of the same grade as last reported. A force of men is engaged breasting out ore. Hoisting through the Engine shaft from the south and east drifts. The Risdale chamber shows a larger body of ore than at our last visit.

South Aurora.—The Mitchell and Hanly shafts are connected with the main lower tunnel. A distance of 25 ft. will connect the Turner and Trewella shafts with the main tunnel. There is a force of men engaged in cross-cutting west from the Mitchell and Hanly shafts. The indications are favorable for mineral.

Copper Glance.—Two men are employed sinking a new shaft through the limestone cap. In the main 50-ft. shaft there is a fine quality of ore in sight. A force of men will soon be put on to start a drift from the bottom of the shaft.

Original Hidden Treasure.—The bad condition of the roads leading to the mine cut off the ore supply, and the Big Smoky mill has shut down until the road improves so as to permit shipment of ore from the mine.

Pocotillo.—Since last report a contract was let to run 50 ft. south from the main tunnel. The ore in the face of the drift is of average milling quality, and bids fair to hold out.

Gen Lee.—The Supt. let a contract to run a drift east from the ore chamber (since our last mention of the mine) for a distance of 25 ft. The contractors were to commence work to-day.

Noonday.—The usual force of men is employed breasting out. The ledge averages from 8 to 10 ft. in width. Piling ore on dumps.

Arizona.

Mines and Mining.—Prescott *Union*, Jan. 25: The Tiger is yielding ore more than half of which is silver. It is being sacked for shipment to S. F. This ore is from the 100 ft. level, where there is plenty of the same sort. The Benjamin, and adjecent mines, near Prescott, are yielding rich silver ore.

The Josephine mine is small, but very rich in free gold.

In Wickenburg dist. the Vulture Co. are mining and milling, and Bill Smith is preparing to start his 10-stamp mill.

Placer miners are doing very well with the limited supply of water in the several creeks.

A portion of the machinery of the new 10-stamp mill, which Mr. Berger is going to erect, near Ehernberg, has arrived, and work is being pushed upon both mill and mine.

Southern Arizona.—Among the latest and most valuable discoveries is a new dist., in a mountain range 35 miles south of Tucson. At the time of writing, specimens of the ore were being tested, and the results had given the utmost satisfaction. The location must be less than 25 miles distant from the timbered regions of the Santa Rita mountains.

Idaho.

Bullion.—Silver City *Avalanche*, Jan. 27: W., F. & Co., shipped from here this week 8 bars valued at $17,528 30.

Local Record.—The North Oro Fino Co. is pushing its work forward fast. The Supt. is working this mine through the North Discovery engine shaft, which he has leased from the Owybee Co. for that purpose. The ore in the drift running north is getting better the further it is run. The 3d level drift has been run about 25 ft. since work commenced, showing the ledge to be 4 ft. wide, with from 18 to 20 inches of fine looking quartz and the remainder talc.

The North Oro Fino Discovery ground is turning out about 25 tons of ore per day, which is being piled up at the Owybee Co.'s mill.

The South Discovery of the Oro Fino, which belongs to and is worked by the Ida Elmore Co., is yielding 20 tons of ore daily.

The Ida Elmore may be considered the leading mine in camp at present. Up to this time about 80 ft. of a very rich chute of ore has been discovered in the 7th level of that mine. This chute, or chimney of ore commences about 100 ft. north of the shaft and continues to the end of the drift, which is being run fast. The richest and best part of the ore hitherto found is in the last 15 ft. of the drift. The Supt. is energetically sinking and raising winzes in the 7th level on this rich body of ore. If it is found to go down any distance, he will immediately sink the main shaft for the 8th level.

The Owyhee Mill is running to its utmost capacity on Golden Chariot. Mr. Davis, Supt. of that mine, has about 700 tons of ore ahead of the mill.

The Minnesota is looking splendidly, both in the south drift and also in the winze which is being sunk under the old shaft. Some of the richest gold bearing ore ever taken from any mine in camp came from the south drift this week. The ore from the winze shows a larger proportion of silver. The foreman has out about 80 tons of the ore. The last crushing paid $60 a ton. The south drift is in 35 ft. and the north drift about 60 ft. from the 2d level.

The Mahogony is beginning to send down ore again, which is being worked on one side of the Elmore mill, with 10 stamps and 6 pans. It usually mills from $55 to $60 per ton, and the ore now piled up at the mill looks splendidly. The 4th level of the Mahogany is rich, with a vein from 18 inches to 2 ft. in width. The drift is in about 50 ft. on each side of the cross-cut or shaft in the 4th level. The winze is down 50 ft. from the 3d level, and the shaft is down below the 4th, for the 5th level, 85 ft. In 20 days 25 tons of ore per day may be expected from the Mahogany.

The 4th level drift of the South Chariot is in 186 ft., showing the ledge to be fully 2 ft. thick, of ore that will pay well.

The Empire mine is being worked by Mincar & Hanks, and they have 50 tons of ore on the dump that will mill at least $150 a ton. The smallest amount that the ore ever paid per ton, was $182 50, and from that to $300.

The War Eagle has very rich looking ore in the winze, which is about 100 ft. south of the shaft When that is done, stoping will commence at once.

Montana.

Clancy Creek.—Cor. Helena *Gazette*, Jan. 22: Bell & Co., of El Dorado, have doubled the number of their hands on their mine. The French boys, of the Minnesota, have a three foot vein of paying ore, and doing a good business taking it out. Parker and Woods have struck galena ore in a shaft on the Mineral Hill lode, and expect to strike galena in their tunnel on the Lone Hand, as soon as they break through a key they have in the back part of it. Brooks & Gregoire have struck some galena in the tunnel of the Winnona, but not in paying quantities. They are confident of striking a large vein of paying mineral before going 40 ft. further. There is considerable galena ore being taken out of the North Pacific. All the lodes mentioned above are galena bearing quartz; but some portion claim to have struck some very rich chloride quartz, about 2 miles from this place. Some of it is claimed to go $1,200 per ton. There is considerable work being done in that portion of the dist. where chlorides have been found, and it is expected that large quantities of paying rock will be taken out there, in the spring. There are quite a number of parties prospecting in this vicinity, and more parties are being organized to commence work as soon as the snow goes off.

The New Coal Mines.—Bozeman *Avant Courier*, Jan. 25: As soon as the weather permits, Col. Black will commence the development of the new coal mine. The indications are highly favorable as for as prospected. The mines are about 5 miles from Bozemen, accessible by a good wagon road, and consist of 2 well defined veins, about 200 yards apart.

The Reduction Works.—Helena *Herald*, Jan. 25: The Helena Reduction Works are running continuously, day and night. The delivery of ore is uninterrupted, and the roasting, crushing, and smelting goes forward with the precision of clock work. From one smelter alone flows 2,000 weight of bullion every 24 hours.

Vipond.—Dear Lodge *Independent*, Jan. 27: J. Brannigan and others are trying to make arrangements to have smelting works erected near the rich lodes of this district.

Cable.—Mr. Cameron has at last struck the ledge in the lower drift. The rock is rich and there is reason to believe that the body of ore now drained will be sufficient to keep at least one mill constantly running for the next 2 years.

Utah.

Little Cottonwood.—Salt Lake *Tribune*, Feb. 1: The Wellington Co. are now shipping very rich ore. Its assay value is $300 per ton.

The Emma, Flagstaff and Vallejo are each shipping.

Ohio Dist.—Cor. same: We have 50 or 60 men here and the greater share are at work on their leads in order to have them ready for sale in the spring, or to have their ore ready as soon as an opportunity presents itself or mills get in here. There are 5 to 6 that will pay from the start, but most of the mines have to be worked, as the croppings are of low grade, but of all that have been worked to any extent the ore grows gradually richer.

There have also been two new dists, formed, one south, and in still greater altitude, and one north adjoining to this one and on the banks of the river.

S. L. City.—By telegraph: About 3,000 tons of ore and bullion are waiting transportation to the East. Of this, about 1,500 tons are from the Emma mine.

S. F. Stock Exchange Board.

San Francisco, February 8, 1872.

The last seven or eight days has been the liveliest one the Stock Board has experienced for many years. The feature of the week has been Savage, and many other stocks have participated in the rise. The discovery of a rich body of ore in the Savage, announced on Friday night, sent the stock up so that from that time until Monday, the value of the mine was more than quadrupled. All kinds of stocks are yet much advanced, but show a little falling off from Monday's prices. The sales at the Board for the week, ending Wednesday, the 31st ult., aggregate $4,208,000, making a total of $8,748,000 in two weeks. The session of the Board on Saturday was a long and active one, lasting three hours. Savage was the feature, and its advance over the prices of the morning Board on Friday was 92. For the same time Gould & Curry advanced $50, Hale & Norcross $30, Crown Point $25, Belcher & Kentuck $15, Imperial $12, Chollar-Potosi and Ophir, each $11, Cons. Virginia $8, Raymond & Ely $6.50, Alpha and Overman, each $6, Sierra Nevada $5 and Yellow Jacket 4.50.

On Monday the market opened lively in the morning, and the Board had another long and busy session. From the Board on Saturday nearly all descriptions of stocks advanced materially. Savage went up to $235 and then dropped to $225, the others sympathizing with it. On Wednesday morning it sold for $5,500 per *foot*. Its highest price before was in June, 1867—$5,000, when it was paying large dividends.

This morning stocks were still active but with irregular prices. Savage receded from 310 yesterday to 625 on the last call of the Board, though $265 was bid after the adjournment. The amount of business transacted since the Savage strike became known on Saturday, aggregates over $10,000,000, nearly double the amount transacted during any four days heretofore.

Comparative Prices—Extremes, Advance and Decline.—S. F. Stock and Ex. Board.

The Railroad Works at Sacramento.

The workshops, round house, foundries, etc., of the Railroad Company in Sacramento, are by far the most extensive to be found on this side of the Rocky Mountains, and very few people have any idea of the magnitude and industrial importance of the works there in progress. The Sacramento *Record* recently made a visit to the establishments and presented an account which will give a tolerable idea of the enterprise in operation.

The Railroad Works.

The establishment generally known as the railroad works, or the "round house," consists really of a series of manufactories or shops, viz: the round house, the machine shop proper, the blacksmith shop, the foundry, the brass foundry, the tin and cooper shop, the car-building shop, the painting works, the upholstery department, the general hardware store, the drying house and the fire-brick works. Armed with a permit from A. N. Towne, General Superintendent of all the railroads and railroad shops and offices this side of Ogden—and probably as fine an executive officer as there is in America—we waited upon A. J. Stevens, master mechanic of the machine shops. Our faint description will follow the route of his guidance. First:

The Round House.

This stands close to the bank of the American river, and, with its foundation, forms a portion of the impassable artificial barriers which have been erected to prevent the turbulent stream from flooding the city and destroying the property of its inhabitants. It is a substantial brick building, forming the segment of a circle, and contains stalls for 29 locomotives, most of which are generally occupied, either by disabled engines undergoing repairs, or engines in complete order and ready for service at a moment's notice. In fact, several of these last named have steam up all the time, and stand ready to go at the tap of the bell or the click of the wires to the remedy of any mishap that may occur upon the line of the roads in any direction from the city.

Owing to the lack of ground space, portions of the round house are necessarily made a part of the machine shop, and from 100 to 125 men are here constantly engaged in repairing or rebuilding damaged and disabled engines. One locomotive is now on the stocks, and being rebuilt—converted from a five and a half feet to a four and a half feet engine. Several others are undergoing extensive repairs. Within the last nine months seven engines have been entirely rebuilt here; 45 have undergone general repairs, and 30 necessary repairs. At present nearly all the engines of the company are in first-class order, but so many unavoidable accidents are constantly happening to the internal machinery of the "iron horse," that it is likely that from 100 to 125 men must be constantly employed in the round house portion of the machine shop to repair damages. From the round house we enter that portion of the establishment which may be properly designated

The Machine Shop Proper.

This is a building 100x400 feet, and under the direction of the superintendent of this establishment 400 men are now employed, whose wages average $2.75 per day each, in gold coin. The number will be increased, if possible, and would now be at least 200 greater, if the company had been allowed to fill in more of the nasty and—to the public—worse than useless slough, so as to give more shop room. This establishment is a sight to witness, with its apparently and interminable mass of machinery, constantly clattering, grinding and "scrunching," its host of busy and intelligent mechanics engaged upon the most curious and intricate parts of complicated machinery — all evidently happy and contented, and having an individual pride in the excellence of their work. The shop has a plethoric supply of the very best planing, turning, cutting and punching machines for working iron. The machine shop is fully capable of turning out all kinds of machinery known, though, of course, its engines are solely devoted to such machinery as is usual upon railroads and in steamboats. Here are made all repairs of damages of a serious character to engines and cars upon the Central Pacific, California Pacific, Western Pacific, Stockton and Copperopolis, and Stockton and Visalia Railroads. Much of the work required for the San Francisco and Northern Pacific road is also done here. The addition to this building, recently made, is fast being filled with new machines of the best kind, and soon a much larger number of men will be employed.

Boiler Shop.

This is a new building 60x200 feet. It is now engaged in manufacturing additional boilers for the great engine which drives the machinery of the vast establishment. It is also intended to do all steamer work for the company. Two large boilers are now in process of manufacture for the Chrysopolis. They have eleven-foot shells, will be twenty-two feet long, have steam chimneys twelve feet high, and weigh thirty tons each—the largest boilers ever made in this part of the State. Here are made all the nuts and washers used on all the railroads and steamers—articles which, until lately, were imported. In addition to its other work, the boiler shop has, within the last three months, turned out 40,000 feet of sheet iron water pipe. The workmen are now engaged in manufacturing artesian well pipe for use in the Merced region. The shop has a machine—made in the machine shop—for punching holes in the iron used for water pipe, which will punch forty holes at once. It also contains a corrugating machine for shaping sheet-iron to use on roofs and sides of iron-covered buildings.

Fire Brick.

En passant, it may be as well to state that the Company has on its premises machinery engaged in the manufacture of fire bricks, from clay brought from the Rocky Mountains. These bricks prove to be good, and it is intended to manufacture here all that are necessary for the Company's purposes.

The Foundry.

Though this building has been recently enlarged, it is still insufficient to meet the demands upon it, and, as a consequence, work which should and could be done here to the great benefit of the city, is sent elsewhere, and simply because the company has been prevented from filling up the slough to such an extent as to give it the ground necessary for the shop building it would like to erect here. At present the foundry is of sufficient capacity to work up twenty tons of iron daily. All the small and most of the largest castings used on the road are now cast here. Car wheels as good as those imported have been made here; and all the wheels required on the road will be made here if room can be found for the enlargement of the foundry buildings. The foundry contains two cupolas, both manufactured in the machine shops, capable of turning out 4,000 pounds of molten metal every forty minutes.

Brass Foundry.

This is still another establishment. In this are made all the brass castings necessary to be used in the construction of cars and machinery. All the old brass that it is possible to find in the country is worked up here, and what more is required is made. Most of this material is imported from the East, for the reason that the supply of California copper cannot be relied upon.

Copper and Tin Shops.

In this shop all the tin and sheet copper work required for all the roads is done—whether manufacturing or repairing. It can turn out anything required, from a copper cauldron to a tin dipper, or from a mamoth head-light to a hand lantern.

Blacksmith Shop.

In this department 100 men are incessantly employed, and forty fires are constantly burning during the day. During the last year all the iron-work for ten new bridges has been made here, and all the iron work for the repairs of all the bridges upon the roads. It works up about 200 tons of iron, and does all the blacksmith work required for the roads. In this shop is a steam hammer weighing 2,500 pounds, with a drop of thirty-six inches. A new furnace is being erected for the manufacture of all bar-iron required by the company. The iron is to be made out of scraps and old iron generally. Here old and worn axles are worked over and made good as new. A steam machine for shaping arched bars for holsters to freight cars is now nearly completed. This is a new concern manufactured in the machine shop of the company. Whenever the company is allowed the privilege of making more ground, it will erect sufficient rolling mills for its purpose, and thus do here much work now done elsewhere.

The Motive Powers.

And here a few words of description of the power which keeps all the machinery of this vast mechanical establishment in motion. It is a magnificent Nightingale engine, of 175 horse-power, and having a driving wheel eighteen feet in diameter. The steam is now supplied by two large boilers. Two more, now in construction, will soon be added, which will increase its strength to 190 horse-power. From the engine room we pass on to the

Car Department,

which is under the supervision of Ben. Walsh, who, like Mr. Stevens, is thoroughly devoted to this particular branch of mechanics. In this department, including all its branches, 400 men are now daily employed, at average daily wages of $2.75 each. And here, too, as in the other departments, very many more would be employed if there was only room enough to erect the necessary works. This establishment is capable of manufacturing everything in the car line, from the common truck to the most luxurious palace car. That it has not room in which to spread itself is the reason why vast quantities of this sort of work is done elsewhere, and large sums of money sent abroad that should, by rights, be expended in Sacramento. A splendid car, for the use of the President of the company is now in course of construction. It will contain kitchen, dining-room, parlor and sleeping quarters. The shop has now orders to manufacture 1,000 of the improved combination cars, to accommodate the agricultural business of the State, and at present is turning out twenty-four each week. It will increase the product to six a day as soon as material can be obtained. The car shop consists of a main building two stories high, 90x200, with a wing 90x300. Some 50,000 feet of lumber are worked up here each week. The rough timber passes into the building on one track, and keeps moving along constantly until it comes out on another in the shape of cars, all finished except the painting. Thus, from the raw material going in at one door a daily train from four to six cars passes out of the building through another. And this is only about half what is necessary. The car shop is amply supplied with the best of planing, gouging, morticing, dovetailing, boring, scraping, sawing, veneering and other machines. Here, too, the finest of cabinet work—such as is to be seen in the best fitted-up cars—can be and is turned out.

Draughtsmen's Room.

In this little apartment presides the creative genius of the entire establishment. Here designs are conceived and plans of all descriptions drawn up and prepared, from which the intelligent mechanics construct those surprising achievements of human skill which are the admiration of all.

Paint Shop.

This adjunct to the car shop is under the foremanship of Mr. Fitch. Here, on the average, eight cars are constantly receiving the finishing touches of the shop painter. With the present capacity of the shop, only about four passenger cars can be turned out each week, while to give the necessary annual coat of paint to all passenger cars of the company, over six a week should be disposed of.

If ground can be made, an additional paint shop, 70x220 feet, with five varnish rooms, 22x70, will be erected.

The Fire Brigade.

Not the least interesting feature of this vast establishment is its facilities for extinguishing fires. There is a fire brigade composed of three companies. The men are trained to their fire duties at least once a week. The apparatus consists of a stationary steam engine, several hydrants properly located throughout the premises, 2,000 feet of hose—1,000 leather and 1,000 carholized. Along the ridge-pole of one of the buildings is a perforated pipe, through which immense quantities of water can be rained down all over the premises in case of a conflagration. Three blasts of the whistle warn the men of danger and to be ready; three more blasts brings each one to his post. A more effective Fire Department does not exist anywhere.

The Company is now manufacturing the famous Westinghouse Atmospheric Brakes, and as fast as possible applying them to all passenger locomotives and cars. With these brakes—which are controlled by the engine driver—a train of ten cars, going thirty miles an hour, can be stopped in a distance of 400 feet or less. By the application of this improvement the danger of traveling will be much lessened.

Much remains to be described. We have, however, given enough to show that in Sacramento, is the greatest mechanical establishment to be found west of the Mississippi. Moreover, this establishment is employing constantly some 850 men, who are receiving in wages $2,384 daily, or say full $701,100 per annum. This sum goes to enhance the prosperity of the city, by increasing the trade of all classes of shopkeepers, while the men employed and their families add to the value of real estate by creating a demand for dwelling houses. Further, these benefits of industry might be doubled to the town if the company could do what it seems to desire, viz.: increase its works here to a capacity sufficient to supply all the demands of its roads and boats.

Another Washoe Mining Invention.

Among the recent inventions important to miners, is one by Mr. E. P. Pyne, of the Ophir, which is intended to guard against the danger that is sometimes encountered at stations in shafts. The Virginia *Enterprise* of the 18th inst. says:

We were yesterday shown a model of the new "Station Safety" and have no hesitation in saying that it is just the thing needed. It is very simple in construction and of trifling cost—merely the price of two or three small iron rods and a common wooden door. With Mr. Pyne's invention in use it will be impossible for any miner to walk from a station into the shaft or to run a car into the shaft—and be pulled in after it—as has often happened in our mines. When the cage is not standing at the station the door from the hoisting compartment opening into it (the station) remains closed, and it is impossible for any one to get into the shaft without first deliberately pulling open the door. The door is self acting—opening when the cage arrives and closing the moment it passes either up or down. The door is opened by the pushing outward of the upper hinge and closed by the hinge being drawn in again to the perpendicular. These two movements are effected by the pressure of a block attached to the cage upon a curved iron rod attached to the hinge as a lever and to a weight which serves as a counterpois to the door. The new "Station Safety" requires no attention, and being once put up is always on duty ready to take care of the miners when they forget to take care of themselves. Mr. Pyne has applied for a patent upon his invention and will doubtless obtain one without difficulty.

Names of Nom-de-Plume Writers of Note.

* Deceased.

The newspapers of the world are estimated to number 12,500, and the average number of sheets issued daily at 12,000,000. Europe has about 7,000 journals, America 5,000, and the remainder are divided between Asia, Australia, Africa and other outlying regions on the outskirts of civilization.

Useful Information.

More about Artificial Leather.

In our issne of December 9th, 1871, we gave qnite a full account of the production, properties and uses of the new article of commerce, known as "artificial leather." Since that paragraph was published, we have received inqniries as to a very material part of the process of the manufactnre, which was therein omitted, for the reason that we were unable to give it, to to wit,—the mode of reducing the leather scraps to "pulp." Possibly the following item which we clip from the *London Trade Circular*, may answer the query:

Compressed Leather

Is at present manufactured from the refuse of saddleries and shoemaking establishments. The refuse is first cleaned from dirt and foreign substances, cut into thin strips, mixed with the refuse of raw hides, and soaked in water containing one per cent. of sulphuric acid, until the whole forms a plastic mass, which is filled into moulds and subjected to pressure. After drying the material, then, by means of steam, it has to pass through a system of rollers to render it soft, even, and similar to real leather; one per cent. of glycerine is used to prevent its cracking. It may be used, on account of its cheapness, where it is not exposed to moisture.

The article above described is evidently qnite different from the "artificial leather" described in our issne of Dec. 9th, of which it will be observed caoutchouc formed a very considerable portion, while it is entirely absent from the "compressed leather" above described. But if leather scraps can be dissolved as above, the machinery of the "pulp" in the former instance is easily arrived at.

A Big Clinker.—Probably the biggest clinker ever known in the history of man is that now in the cellar of a former extensive stove store on River street. About 9,000 stovea were melted down by the Great Fire into one mass, which gathering into it an immense quantity of bricks and atone, presented, when cooled off, one of the most formidable masses of *debris* occasioned by the fire. Every endeavor to break it up hy any ordinary means having failed, one of Fox & Howard's immense pile drivers was employed for that purpose, but even its huge hammer has so far, after four weeks bard work, proved ineffectual. The hammer of the first "driver" has been completely smashed up in its vain endeavor to conquer the stubborn clinker, and now a new machine of this character has been set to work. It must he several weeks yet before this obstruction to rebuilding can be removed. Chicago is ahead yet on clinkers.—*Western Rural.*

The Castor-Oil Plant.—This plant is a native of India, and has been known from the earliest antiquity, seeds of it having been found in Egyptian sarcophagi. It was used by the Greeks. In its native country it is a perennial, fifteen or twenty feet high, with a thick stem. In cold climates it becomes an annual. There are many instances of perennial plants becoming annuals hy change of climate.

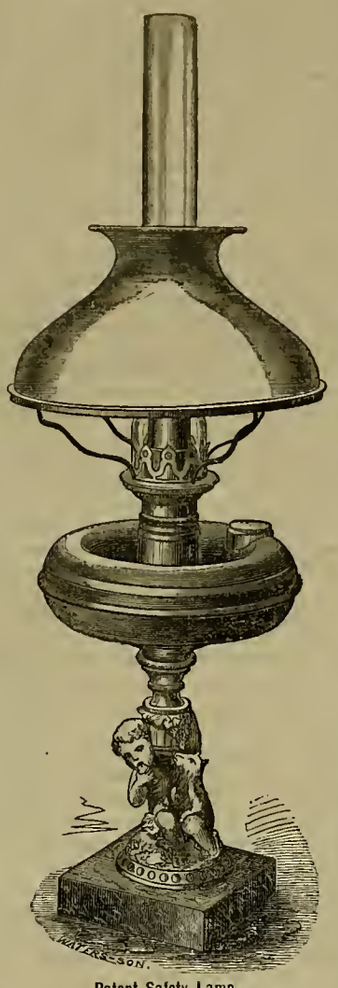
The rapid growth of the plant is illustrated hy an instance reported in Tennessee. A castor bean was planted in May, 1871, in a garden in Memphis, and in November it had grown to the hight of twenty-three feet, with a spread of foliage fifteen feet in diameter. The trunk, ten inches above the ground, was eighteen inches in circumference.

Thistle Whisky.—The New York *Independent* discourses thus eloquently in regard to thistle whisky in Canada: "Do men gather figs from thistles? No; but the Canadians are making theirs into whisky. The beverage is distilled from the stalks and leaves of the Canada thistle, and is represented to be about thirty-five per cent. alcohol, and to have a pleasant aromatic flavor. The effect upon the system is very penetrating and exhilerating, "the sensation" being the same as if a Jewsharp in full tune was attached to every nerve. Persons who have been played on with Jews-harps after this manner will be able to tell whether they would like thistle whisky or not."

525,600 railroad trains leave London in the course of one year.

Patent Safety Lamp.

The accompanying illustrations represent the Bright-Union Safety Lamp, one which possesses considerable merit, since it is the only one that has the burner connected with the tube separate and distinct from the reservoir containing the oil, and

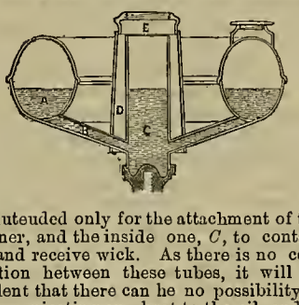


Patent Safety Lamp.

in case it should be upset, the oil will flow *from* the burner and not come in contact with the flame. Most of the lamps in use have the burner screwed direct on to

the fonnt, or oil tube containing the oil, there being nothing in that case to prevent the accumulation of gas, and from that cause we hear of numberless accidents from explosions.

This lamp is constructed with two tubes, as will be seen in the cut, the outside one,



D, inteuded only for the attachment of the burner, and the inside one, *C*, to contain oil and receive wick. As there is no connection between these tubes, it will be evident that there can he no possibility of communicating any heat to the oil, and as long as the oil in a lamp can be kept perfectly cool. there is no chance for an explosion. The tube to which the burner is attached, *D*, is free from the oil tube, *C*, and a space for air, passing from the lower end, between the tube of the burner and the tube of the oil, keeps it always cool. The oil receptacle represented by *A* admits the oil through an opening in the top whenevor it passes down through the tubo *B* into the tube *C*. *E* represents the burner.

When the burner is attached to the lamp it will be seen that there is no opportunity for the oil to escape, should it be overturned, and in case any accident should result, the worst consequences that would occur would be the breaking of a chimney or shade. The patent for this invention was obtained through the Scientific Press Patent Agency, by M. Samuels, and the lamps may be seen at Centor & Bryant's, No. 10 Third street, in this city.

Good Health.

The Sensation of Absent Limbs.

It has long been known to surgeons that when a limb has been cut off the sufferer does not lose the consciousness of its existence. This has been found to be true in nearly every case. Only about five per cent. of the men who have suffered amputation never have any feeling of the part as being still present. Of the rest there are a few who in time come to forget the missing member, while the remainder seem to retain a sense of its existence so vivid as to be more definite and intrusive than is that of the truly living fellow member.

A person in this condition is haunted, as it were, by a constant or inconstant fractional phantom of so much of himself as has been lopped away—an unseen ghost of the lost part, and sometimes a preaence made sorely inconvenient by the fact that while hut faintly felt at times, it is at others acutely called to his attention by the pains or irritations which it appears to suffer from a blow on the stump or a change in the weather.

There is something almost tragical, something ghastly, in the notion of these thousands of spirit limbs haunting as many good soldiers, and every now and then tormenting them with the disappointments which arise, when the memory being off guard for a moment, the keen sense of the limb's presence betrays the man into some effort, the failure of which of a sudden reminds him of his loss.

Many persona feel the lost limb as existing the moment they awaken from the merciful stupor of the ether given to destroy the torments of the knife; others come slowly to this consciousness in days and weeks, and when the wound has healed, but, as a rule, the more sound and serviceable the stump, especially if an artificial limb he worn, the more likely is the man to feel faintly the presence of his short member. Sometimes a blow on the stump will re-awaken such consciousness, or, as happened in one case, a re-amputation higher up the limb will summon it anew into seeming existence.

With others it is a presence never absent, save in sleep. "If," says one man, "I should say I am more sure of the leg which ain't than of the one that is, I guess I should be about correct."—*Lippincott's Magazine.*

Painless Extraction of Teeth.

Dr. A. C. Castle—*Dental Cosmos*—observes that he has for thirty years adopted the plan of obtunding or benumbing the extremities of the temporal nerves, for painless extraction of teeth from their sockets, with complete success, never having used or countenanced the exhibition of chloroform, ether, or nitrous oxide gas for this minor surgical operation. The benumbing, or *mechanical anæsthesia*, of the temporal branches of nerves, obtunds the whole nerve to a sufficient extent to allow the teeth to be removed, with sensation so slight that, if not attending a special surgical operation, it would scarcely be noticed by the patient. One of two modes may be adopted. By application of ice to the temples, which is somewhat distressing, the sensation of cold striking deeply. The other, to which he gives the preference, is done by an assistant, with each of his middle fingers pressing with persistent firmness into the *fossa* or hollow behind the ridge or the temporal bone, which forms the external bone circle orhit of the eye. Pressure for one minute is all that is necessary. The practice is as simple as it is harmless, and leaves no after unpleasant sensation to annoy the patient. It is an instinctive method often adopted by people themselves, who press their temples with their fingers to relieve themselves temporarily of the acute paroxysma of nervous headache. This temporary pressure, with sufficient force, is all that is required to remove teetb painlessly.

New Style of Vaccination.

The November number of *Harper's Magazine* gives the details of an improved method of vaccination, which, in view of the ravages of small-pox in our cities, may perhaps deserve the attention of our medical practitioners. The new plan was first practiced by a Mr. Ellis, an English physician. Ordinary vaccination is performed by scraping off the epidermis and thrusting the vaccine virus into a puncture made by the lancet. A greatly improved method, however, consists in raising a small blister by a drop of cantharides applied to the skin. This is to be pricked and the drop of fluid let out, and a fine vaccine point put in this place, and withdrawn after a moment of delay; the epidermis falls back and quite excludes the air, shutting out any germs that might be floating in the atmosphere. This method has been practiced by Mr. Ellis for twenty years, and out of hundreds of cases of vaccination which he has performed he has never had an instance of blood-poisoning or abcess, while by the ordinary method an occurrence of secondary abcess is by no means uncommon, and that of pyæmia is often observed. The comparative safety of this method is believed to be due, first, to the exclusion of the air; and, second, to the lesser size of the aperture for the introduction of mischief, than when the punctures are made by the lancet.

Cure for Burns.

Scalds and burns which are not much more than skin deep are instantly relieved of pain, by excluding the air; that which does it the most perfectly, gives the most decided relief, and is most likely to be at hand in an emergency, is the best. Plunge the part in water, cool or warm; but as this is not applicable to some portions of the body except for a short time, too short for the healing process to take place, it must he regarded as a temporary expedient while some more permanent application can be prepared. Sprinkle common flour over the burned part until it is entirely covered over; the moisture of the wound causes the flour to form a plaster impervious to air. If this plaster cracks or scales off, the part can be moistened with warm water and flour applied as before. In a very few days a beautiful new skin will form, without a scar, and the cakes will fall off—or apply warm water until they become so soft as to fall off of themselves; do not pick them off with the finger nails. The inconvenience of the hard coating can be avoided hy using another application made of oil and lime water. Pour water on a lump of unslacked lime; as soon as it is clear stir in sweet oil until it is as thick as thick cream, by slacking, and apply it freely at the time, and subsequently as often as any discomfort arises. If boiling water is poured on the lime rock, it will clear in a few minutes. Good druggists always keep lime water on hand. Families would do well to keep a bottle of the mixture always on hand; it will keep a year, and can he taken and used at a moment's notice, the natural skin growing again without a scar, and without the inconvenient hard caking of flour.

Charcoal.—If charcoal is taken into the stomach in a fresh condition, it tends to correct acidity, and to vitalize and invigorate, although scientists may be puzzled to explain exactly why. The most plausible theory is that it promotes slow combustion, making the partially decayed matter burn up and leave nothing but fresh. If a piece of meat is packed in fresh charcoal, and occasionally repacked, it will be all gone at last, but it will remain fresh. Charcoal will even restore meat partially decayed. Meat that has been overlooked until it is quite offensive, by washing and packing in charcoal is restored. Used in the mouth, some authors say it tends to prevent decay of the teeth. A considerably large piece, held in the mouth once in a few days or even weeks, will keep the breath sweet, and tend to preserve the teeth.

Darkness in the Treatment of Small-Pox.—If a patient, in the beginning of the attack, be put in a room from which absolutely all light is excluded save that of a candle, the effect is to arrest the disease in the papular or vesicular stage; the skin between the vesicles is never inflamed nor swollen; the large scabs of matter never form over the face; there is no intense pain, and only trifling itching, and the smell is either very slight or altogether wanting.—*London Lancet.*

Milk slightly turned sour is a common cause of diarrhea in children and infants.

Table of Contents.

CORRESPONDENCE.—Mining and Other Matters in Montana; Inyo County Mining Matters; San Diego Mines; Mining in Placer and El Dorado, 82.

DOMESTIC ECONOMY.—Various Ways of Cooking Potatoes; Economy of a Damper; Mechanical Hints, 91.

EDITORIALS.—California Petroleum, 88; The Mining Interests, Trade Marks, Mining Accidents, 89; Academy of Science, 81.

GOOD HEALTH.—The Sensation of Absent Limbs; Painless Extraction of Teeth; New Style of Vaccination; Cure for Burns, 87.

ILLUSTRATIONS.—U. S. Signal Service Department, 81; An Improved Shoe Fastening, A New Cooking Apparatus, 89.

MECHANICAL PROGRESS.—Friction Gearing vs. Belts and Cog Wheels; Rolling Iron; Testing Cotton Gins, 83.

MINING SUMMARY.—Reports from Mines in various States, Counties, and Districts; Stock Reports; Metal and Leather Markets; Share holder's Directory, 84-5.

MISCELLANEOUS.—The Railroad Works at Sacramento; Another Washoe Mining Invention; Names of Nom-de-Plume Writers of Note, 86; For the Protection of Miners, 81; The Geological Survey, Belcher Mine, Etc., 92.

SCIENTIFIC PROGRESS.—The Permanent Gases; The Sand Blast; The Pneumatic Sewage System, etc., 83.

USEFUL INFORMATION.—More About Artificial Leather; The Amethyst of Commerce; Improved Soap Bubbles, 87.

TO CORRESPONDENTS.—Our numerous correspondents will save us much trouble and perhaps make their articles more satisfactory to themselves, by dividing the subject matter and puttiug in appropriate "sub heads" while they are writing. By noticing the letters iu the PRESS from time to time, they will see that the majority of the letters are divided in the manner referred to, bnt wo generally have to do it ourselves. Frequently something is spoken of in the first part and again referred to below, making it difficult to divide it propérly. By doing as we suggest our correepondents will find it easier to write clearly and at the same time oblige us. If you are going to treat of several subjects in one letter, write them on a slip of paper by your side, and treat of each one eeperately under its appropriate head. Our endeavor is to make our paper as fresh and attractive as possible, and if our readers deeire to read one thing and not another, by seeing the articles "subheaded" they can take their choice.

MINERS' MEETING.—The telegraph informs ns that the miners' meeting held at Grass Valley on the 3d inst. took action against the nse of giant powder in the mines. They did uot resolve to strike, but voted to meet again on the 10th, and meanwhile the different mining superintendents are to be interviewed. It is currently reported that another strike will be ordered if the use of giant powder is continued in the mines.

BEET SUGAR.—The Sacramento *Record* of the 3d says that the Sacramento Beet Sugar Company have just finished working last year's crop of beets. The product is nine hundred barrels of excellent refined sugar. The season was a very bad one. The Company will culitvate twelve hundred acres of beets this year, adjoining its Manufactory, and expect to produce at least ten thousand barrels of sugar the coming eeason—perhaps eleven thousand—besides several hundred barrels of excellent molasses.

ON FILE.—"Battle Mountain;" Letters from "S & P.," "N. M.," and "P. A. R."

California Petroleum.

Discoveries in San Fernando, Los Augeles County.

A telegram on the 3d inst. informs us that an experimental shipment of 100 barrels of crude petroleum was being shipped from San Fernando District, Los Angeles, for the petroleum refinery of this city. We had already been informed that recent developments at that locality had been such that much attention was being attracted to those deposits, and on further inquiry we have learned that a company is being formed in this city to thoroughly develop the deposit, and secure a home production for this important and indispensable commodity. From the facts which have been elicited, we feel warranted in saying that one of the most important enterprises is about to be set on foot which has yet been attempted iu the State. The gentlemen engaged in this enterprise are so sanguine of success that they are preparing the material and machinery to commence operatione in a short time, and orders have already been received from a single house, for 1,000 barrels of oil per day, under a contract for an unlimited time—an order which the company is fully assured they will be able to answer as soon as the proper arrangements can be made to commence operations in earnest.

The Locality of These Deposits

Is at a point about 35 miles distant from the Los Angeles Railway Depot, over an excellent road, and from thence by rail to the shipping point at San Diego, the distance is 21 miles by rail—total distauce to seaboard 56 milee. The wagon road to the railroad is better in wiuter than in summer—thue insuring good transportation at all seasons of the year. According to lateet accounts from the locality, the deposite are very extensive, and from the work done upon them up to this time abundant proof has been adduced that natural petroleum of the highest grade is about to be added as an important and valuable addition to the commercial wealth of California. In addition to nnmerous natural spriugs, from whence the petroleum can be readily gathered in quantity, several wells have been sunk with the most satisfactory result. The shipment above alluded to has been dipped with buckets from natural springs, and yields from 60 to 65 per cent. illuminating oil, while the reeiduum is valuable for gas purposes, fuel, etc.

The formation where these deposits are found, lies in a range of mountains trending nearly east and west, and varies in width from a few hundred feet to a mile or more. The oil is found oozing out from a strata of shale and eandstone, wherever the gulches and cañons have cut it to any considerable depth. In addition to the wells, several tunnels have aleo been rnn, to tap the depesits, from the walls of which the oil oozes, wherever they enter the shale or sandstone strata. The cost of transportation from the springs to the railroad is about two cente per gallon.

Dr. Vincent Gelcich, of Los Angeles, from whom we have gathered the above facts, is now at the Russ House, in this city. He has several gallons of oil with him, samples of which he will be pleased to furnish to such as feel an interest in the matter, and give any information to such as are desirous of becoming acquainted with this new development of the natural wealth of California.

Commercial Value of Petroleum.

It may be interesting in this connection, to look for a moment at what this product of nature is still doing for Pennsylvania, after many years of uninterrupted yield. By examining the commercial statistics of Penneylvania it will be seen that the export of petroleum from that State for the year 1870, amounted to the sum of $34,000,000, more than the gold yield of California. This product hae added greatly to the prosperity of Pennsylvania, and is a source of immense wealth. The demand for petroleum all over the world is very great. The traveler finde it in England, Germany, Russia, Franoe, Italy, and Turkey—all imported from Penueylvania.

In the report of the exports of Philadelphia for eleven months of last year, petroleum is the leading item of that city, amonnting to 52,135,600 gallons at a valuation of $12,457,400, about 23¾ cents per gallon, at the rate of $1,132,490 and 10-11 per month. It hae been remarked with great justice, that petroleum is to Philadelphia what wheat is to San Francisco, only that there is more certainty in the supply and the demaud.

It ie etated in the *Journal Eclairage au Gas of Paris* that Petroleum can be converted into a permanent solid, which will burn without liqnefyiug aud may be preserved in a firm mass for any period. The process is not given, and is a secret. Should this prove to be true, the value of the discovery is incalculable; for with petroleum in a solid state it will take the place of coal upon the ocean steamere, and in all manufactories where coal is now used at very great expenee. According to the recent reports the experiments made with liquid fuel in Russia have been satisfactory in their resulte, and prove a saving of 35 per cent. by ueing naptha inetead of coal. This being true, if the petroleum or its products can be made eolid eo as to be easily handled, the epace occupied by coal on our ocean eteamers can be made available for cargo.

Consumption of Kerosene in California.

On the Pacifio Coast large quantities of this oil is imported from the East, at very great risk and cost, and almost immediately coneumed. The demand is increasing as its uses are becoming very much extended. The Metropolitan Gas Company of this city, intend to use petroleum altogether for making its gas, and the light from it has been shown to be far more brilliant and cheaper than that from coal. Lubricating oils, benzine, naptha, parrafine and corazine, all valuable articles, aro extracts from petroleum; and upon reference to the commercial reports it will be seen that the trade iu them is qnite extensive. The importation of keroeene is one of the immenso draius of gold and eilver from this State to the East, caueing a continual scarcity of money and rates of interest higher than in any other part of the world. Millions go to the Eaet to pay for petroleum, whilst we have a superior article in abundance at our very doors.

As we are satisfied that these deposits of petroleum exiet in San Fernando as represented, and we have the most approved material and machinery for obtaining and refining it, we trust the company now being formed will meet with proper encouragement from the capitalists of this city and State, whose aid will be needed in procuring the means for the full development of the property which bids so fair to secure from our own resources this important commodity, and thns aseist in keeping an equivalent money value at home.

Medicinal Properties of Petroleum.

In nearly every drug store ie fouud a celebrated remedy recommended by English physicians, originating in Asia and pretended to be manufactured in England, known as British or Rock Oil, which is prescribed as a liniment for rhenmatism, neuralgia, etc., which is nothing more or less than pure petroleum and, it ie no doubt often used with very beneficial effect.

As a further example of the the uees of petroleum for sanitary purposes, we may cite the following very interesting and valuable facts. Dr. Gelcich, during the recent epidemic rage of small-pox in Los Angeles, had many patieuts afflicted with that disease, and moreover had to officiate as County Coroner, in performing the duties of which he was often called upon to enter houses and have bodies removed for burial. In fumigating such places he found the most effective way was to place two or three ounces of the oil in a frying-pan, eet it on fire and put it in the middle of the roome. As a precautionary measure for himself he washed his hands in petroleum when it became necessary to handle the bodies; he aleo recommended to every family to place a emall quantity in a saucer in the corner of every room, which neutralized the miasma, purified the atmosphere and effectually prevented the spread of the infection. He believes that to this method is to be attributed the euccess that attended his practice during the eleven months continuance of that terrible epidemic.

The Doctor has used carbolic acid, creosote, chlorine and bromide of potassium, etc., in different forms, as recommended by many physicians, but the best results obtained in cases of small-pox were from petroleum, which is more conveuient, more agreeable to the senses aud a much cheaper article. He recommende its uses in all sysmatic cases whero patients are afflicted with typhoid fever, scarletina or variola.

Antiseptic Properties of Petroleum.

The antiseptic properties of petroleum are well described by Dr. J. W. Twoler, Professor of chemistry, etc., in Hobart College and Geneva Medical College, in his aualysis of it made some time eince. He first describes what putrefaction ie and states, "that it is the decomposition, decay or natural destruction of dead or organic matter. That which promotes pntrefaction is air, moistnre, warmth, cryptogamic plants and infusory inseots. Dead organic substance, deprived of air and moisture and kept in a vacuum, resists putrefaction for an iudefinite time. Chemicals may act in various waye in checking and preventing putrefaction; thoy may in the first place exclude air and moisture mechanically, as it were, like oils, resins, paints, tars, gums etc.

Now certain chemicals act in a two-fold manner—they may either abstract water from the organic matter and form new compounds, or thoy may extract the moisture by the oxygen of the air. Such antiseptics are alcohol, common salt, ealtpetre, etc. Others again, act in a threefold manner; they abstract the water, exclude the air and destroy animal and vegetable life.

The substance that will best perform all this work is petroleum. If for instance, a log of greeu wood be immersed in petroleum, tho water and air in tho pores of the wood are displaced by the petroleum. Petroleum thus excludes air and moisture from organic substances. It also destroys living vegetablos and animals. Petroleum contains no oxygen—which is a necessary element of decomposition. Out of all substances this hydrocarbon appeare to be the most powerful antiseptic known; and I have no hesitation in recommending it for the purpose set forth."

The Ancient Romans were acquainted with the preservative qualities of carbon; this fact is deduced from numerous charred stakes found in their military embankments and dams; but their system of employing it was merely superficial; whereas petroleum and liquid carbon, which covers and protects the minutest pores of the wood, expels the water and air, and thus substitutes the indestructible carbon for materials that promote decomposition."

As an Antidote for the Bites of Poisonous Insects, Reptiles, Etc.

Petroleum is, also, a specific for the oure of the bite of venemous insects, such as bees, spiders, etc., and the bite of reptiles. A farmer in Illinois had a large bee-gum near his house; one day some children playing near it annoyed the bees, which suddenly attacked the intruders and stung some of them in a terrible manner; the mother of the children immediately washed with petroleum the parts stung and inetant relief was obtained. The samo writer asserts that petroleum is an antidote for the bite of rattlesnake and reptiles of kindred nature.

WHEELBARROWS.—The metallic tubular wheelbarrows which are now being so extensively used, seem destined to supercede entirely the old-fashioned ones made of wood. The first cost is a little larger, but they will be found more economical in the end on account of their durability. They are made entirely of iron, are stronger and lighter than wood, and consequently do not require frequent repairs to keep them in order. Nutting & Co., of this city, manufacture four sizes euitable for different kinds of work on the farm and in the mine.

Earnest Talk to Miners.

[For the Press—By Our Miner—No. 2.]

THE MINING INTEREST.

Legislating on Dangerous Ground, Miners' Rights and Miners' Wrongs.

The success which has attended the schemes of the wealthy and influential land-grabbers by which they have acquired possession of the best located agricultural, timber and swamp lands in the State, appears to have emboldened them to make desperate efforts to obtain the incalculably valuable mineral lands also, before the people shall be awakened to the importance of the question.

There are a number of bills before Congress and the State Legislature now in session, designed for this object. The most dangerous of which, and that to which we desire to call the attention of the miners of the State, on this occasion, is the Bill or Resolution, asking Congress to grant all the unsold mineral lands to the State, or in other words, to place them within reach of the land-grabbers. As the quantity of these lands sold is not the one-thousandth part of the whole, the magnitude of the grant asked for becomes apparent.

The pretence for this insiduous scheme to deprive the miners and other classes, of the only free field at present existing, for exercise of their enterprise and the employment of their labor, is, that existing legislation is too cumbersome to acquire title to the mineral lands.

To those unacquainted with the

"Ways that are dark,
And the tricks that are vain,"

of the California land speculator, the advocacy of their scheme for obtaining the mineral lands, by some of the papers published in the mining districts, would appear to express the views of the miners on the question. But appearances are not always to be relied on in such cases.

The proverbial carelessness of the miners on all matters except such as directly pertain to the working of their claims; the arduous character and protracted hours of their labor; the distance from newspaper and post offices of the majority of mining claims, cause the miners very rarely, if ever, to express their opinions on any subject through the columns of the local press. It was a knowledge of this trait in their character, derived from many years experience among them that induced us to commence this series of "Earnest Talk to Miners" to obtain their opinions on questions of the greatest importance to their interest.

The land-grabbers are also aware of this trait in the miner's character, and thus knowing that no miners will take the trouble to contradict any statements which may appear in the local papers, they manage to induce the over-worked mountain editor to publish, as editorial matter, articles written by the land speculator's agents. There is scarcely one editor in twenty, in the mining districts, who can spare the time to go among the miners to obtain their opinions, consequently they are but too glad to accept the opinions of those who assume to speak for them. Such articles, published in good faith by the country editor, become formidable weapons when used in Congress, or in the State Legislature; because they are received as the opinion of the miners in the locality, while in truth they only express the views of the land grabbers.

What advantage would the miners gain, should Congress grant the unsold mineral lands to the State? Absolutely none, while they would lose much more than many of them suppose, and every interest in the State, except that of the land speculators, would suffer an irreparable injury. Under the existing state of affairs, the miner's claim, being part of the public domain, is not taxable. Should the State obtain the mineral lands, every claim would be subject to taxation. The poorest, as usual, paying the largest portion. Estimating all the mines in the State to be worth only $50,000,000, at three per cent., the current rate of taxation, these mines would be taxed $1,500,000 annually, which would be a direct loss to the miner, and but little benefit to any other class of people, except office holders.

The miners in every district now enjoy the privilege of making laws to regulate their own affairs. Were the State to become owner of the mineral lands, special legislation would give the capitalist such advantages over the working miner that the latter would be compelled to work for such wages as the employer of his labor would dictate, or seek for other employment.

The miners, during twenty years of free mineral lands have obtained enormous quantities of the precious metals, which has circulated among every class in the community. What probability is there that the product would be increased, should the mineral lands be owned by a few companies of capitalists?

The strongest arguments advanced by the advocates of the proposed disposal of the mineral lands, in large tracts, is that such a disposition of them would increase the product of the precious metals, by inducing capitalists to erect costly machinery and to employ a large force of organized laborers, exposes the aim of those who seek to obtain these lands, and explains the loss the miners and the State at large would sustain, should they succeed in gaining their object. The whole tenor of the legislation sought, is for the benefit of capital at the expense of labor.

The assertion made by the advocates of the land speculators, that the granting of the mineral lands to the State would induce foreign capitalists to invest their funds in the mines, is one of the strongest reasons why Congress should not thus dispose of them. Should these lands be granted to the State, the State would sell them in the same manner as it has sold its school, university and swamp lands, in large bodies to speculators, who in turn would sell them, at enormous profits, to foreign capitalists. Is it quite certain that the sale of the mineral, or the swamp lands, to non-resident foreigners is either a present or will be a future benefit to the State?

Suppose, for argument's sake, that one or fifty foreign companies should manage to obtain possession of a large portion of these lands. They would take all the profits of such investments out of the State. The comparatively trifling sum they would pay for taxes, would be no equivalent for the loss of the State's resources. It is infinitely more to the interest of the State to defer the exhaustion of its mines, till such a result can be effected by its citizens, than it is to make enormous sacrifices to reach that result through the aid of non-resident foreign capitalists.

To develop the resources of the State, free, intelligent laborers are more essential than non-resident foreign capitalists. The influence of foreign capital already too potent on the Pacific Coast, to place the control of the mineral lands within its reach, would make California assume more the character of a foreign colony, than that of an independent member of the States composing the Great American Republic.

We trust our friends among the miners will think over this question, and inform us of their opinions thereon, that we may place them before the people and the Legislature, in time to prevent the infliction of a ruinous blow to the mining interest

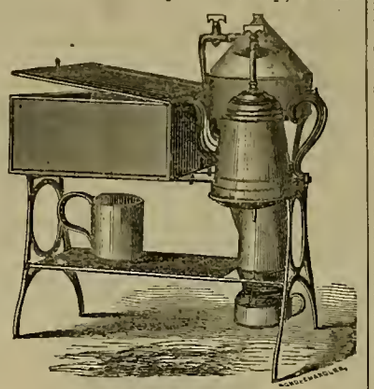
---

The West Side is a handsome journal published at McMinnville, Oregon, by Handley Snyder & Wm. Boone; the latter was once typo and clerk in this office.

A New Cooking Apparatus.

We give herewith an illustration of a new cooking apparatus, a recent invention, known as "Paine's Culinary Apparatus." For summer use, it would be difficult to find, among all the numerous inventions of this kind, anything which is neater, more convenient, compact or cheaper than this device.

Among the advantages claimed for it, is the fact that it can be placed on the kitchen table and a meal of victuals cooked without any perceptible increase of heat in the room, or creating a smoke, or making a litter of any kind. It is also a great economizer of the housewife's time and labor, as it can be instantly made ready, and the



PAINE'S CULINARY APPARATUS.

meal cooked with much less labor, and convenience, than when a fire has to be made in an ordinary stove. The cost of fuel is merely nominal, while it is entirely free from dust ashes or dirt of any kind. The ordinary variety of food can be cooked, coffee made and water heated at the same time. It appears to be well worth the attention of housekeepers.

Wiester & Co., No. 17. New Montgomery street, are the agents for its sale.

An Improved Shoe Fastening.

Among the recent patents obtained through the Scientific Press Agency is one which relates to a device for fastening shoes, by which the shoe can be speedily

and effectually secured upon or removed from the foot as desired.

The present style of shoes worn by ladies are fastened on the side with buttons. These fastenings may be used upon them with great convenience, doing away with the necessity of a button hook, and at the same time presenting a neat appearance. The under flap of the shoe is fitted with peculiar metal standards having holes in them. At the base of the standard is a flange and upon the opposite side of the flange is a screw. The screw is passed through a hole in the under flap, and also through a stiffening, if desired, where a nut is screwed upon it, securing the standard firmly to the flap. Eyelets are inserted in the overlapping flap which are of the proper form to allow the standards to pass through them.

To fasten the shoe, a string with a knotted end is passed through the holes in each of the standards successively from bottom to top. The knot prevents the string from passing through. By using a string of moderate length there is no necessity of unlacing, merely loosen the string, draw it downward, and the shoe can be removed. The device is neat and simple, as may be seen from our cut. Aaron Lawson, of Petaluma, Sonoma Co., is the patentee.

Wiester & Co., No. 17 New Montgomery street, are the agents.

Trade Marks.

The right of a tradesman to the exclusive use of his trade marks, whether it consists of words, letters, figures or other symbols, has always been recognized by our laws, and to imitate a trade mark, either precisely or so near as to lead the public to mistake the imitation for the real, is an actionable offence, as it not only damages the rightful owner, but perpetrates a fraud upon the community. The general government has recently specially provided for granting letters patent for trademarks, so as to more surely protect the rightful proprietors, although the right to use a special mark to represent a particular class of merchandise is as truly and lawfully the exclusive property of the original user without a patent as with it. By patenting his trade mark the proprietor makes a record of its existence, which the public are bound to recognize, and the patent, is an evidence of its originality and proprietorship, which would otherwise be a matter of doubt and would have to be proven.

The slight expense of obtaining a trade mark patent, should not detain a tradesman from securing a government license and a lawful register of his marks or designs. Every individual should depend upon his own exertions to introduce his own manufacture, and when his goods have become known to the public, his trade mark will be a guide to the buyer and a protection to the manufacturer. We are led to make these remarks from the fact that the imitation of trade marks in our community are becoming very frequent of late; for instance, if we inquire for Hucks and Lambert's axle grease, a very useful and serviceable compound, in many places an axle grease put up in cases and bearing marks similar to the H. & L. grease, is thrust upon us as the original article. In the matter of soaps, and in almost every other department of trade we find these imitations, as a general rule. The greater the reputation of any article the more numerous the imitations, and the nearer the resemblance of the trade marks used to that on the original article.

Mining Accidents.

A cave occured in the English Co.'s claims at You Bet last Saturday by which three men were injured, some of them seriously.

A man by the name of Tucker was seriously injured a few days since at the Stetefeldt Mill at Belmont, by inhaling the flames and fumes from the furnace, the damper of which was out of order and which he was arranging. He is in a critical condition.

John Hastis, of Blue Tent, had his leg broken last week, by a mass of pipe clay which rolled down from the bank and caught him.

The *National Gazette* says that R. Trotter of the Soggs mine met with a painful accident on the 29th ult. A number of giant powder caps were condemned as non-explosive and were lying in a tin box on a piece of iron; Mr. Trotter struck one of the caps, which was lying on the iron, outside of the box, with a piece of iron which he had in his hand, when the whole exploded, blowing the tin box to pieces and burying a dozen or more pieces in his face, arms and body.

The Resources of California.—The first number of the second volume of this valuable publication has been laid upon our table, and is replete with carefully compiled facts relating to the various industries and resources of the State. It furnishes a large amount of matter of especial value for parties in other countries desiring to change their residence to this State. As an emigrant aid document, it possesses especial value, and all who receive it will do well, after carefully reading it themselves, to send it to some friend in the Eastern or Western States, or to England. The paper is published by Jno. H. P. Wentworth & Co., at 302 Montgomery street, in this city.

Hygienic and Phrenological Journal.—We have received a number of this new monthly which is edited and published by Dr. Barlow J. Smith. It treats of very important subjects, and presents a neat typographical appearance.

Domestic Economy.

Various Ways of Cooking Potatoes.

Boiling Potatoes.—To boil a potato well requires more attention than is usually given. They should he well washed and left etanding in cold water an hour or two, to remove the black liquor with which they are impregnated, and a hrackish taste they would otherwise have. They ehould not be pared before boiling, they lose much of the starch by eo doing and are made ineipid. Put them into a kettle of clear cold water, with a little salt, cover closely and boil rapidly, using no more water than will just cover them, as they produce a considerahle quantity of fluid themselves while hoiling and too much water will make them heavy. As soon as *just* done instantly pour off the water, set them hack of the range, and leave the cover off the eaucepan till the steam has evaporated. They will then, if a good kind, be dry and mealy. This is an Irish receipt and a good one.

To Boil New Potatoes.—When fresh dug, take small potatoes not quite ripe, wash clean, rub the skiu off with the hand —never use a knife —aud put them iu boiling water with a little salt, hoil quickly; when done, drain dry and lay into a dish, epreading a little hutter over them, or hoil some new milk, put in a great spoonful of butter, and thicken with a little flour wet emooth with milk. When the potatoes are cooked and laid in the dish pour this dip over them. This is very nice.

Mashed Potatoes.—Boil with skins on; when done, peel quickly, and put, as you peel, into a saucepan over the stove, hut not hot enough to hurn; mash free from lumps to a smooth paste; have ready, hefore peeling the potatoes, a piece of butter half the size of an egg, melted, and half a cup of sweet milk with pepper and salt to taste; when the potatoes are mashed smooth, pour in the milk and hutter; and work it in quick and smooth, then dish; dress the top with a knife so as to he round and smooth, ruh on a little heaten egg and hrown in the oven very delicately. Serve with fowls or roast meat.

Potato Croquets.—Boil potatoes with just enough water to cover; when three parte done pour off the water and let them steam to finish cooking; then press them through a wire sieve; this done, put them into a stewpan, addiug one ounce of hutter to one quart of potatoes, and the well heaten yolks of two eggs; mix together thoroughly; then flour the pastehoard, divide the potatoe paste into square parts aud roll them on the hoard to any shape—balls, pears, corks, or what you choose—dip them in egg and hread crumhs, and fry in hot fat to a light hrown.

Potato Salad.—Cut ten or twelve cold boiled potatoes iuto slices from a quarter to half au iuch thick; put into a salad howl with four tahlespoonfuls of tarragon or plain vinegar, six tahlespoonfuls of hest ealad oil, one teaspoonful of minced parsley, and pepper and salt to taste; stir well that all he thoroughly mixed. It ehould he made two or three houre hefore needed on the tahle. Anchovies, olives, or any pickles may he added to this salad, as also slices of cold heef, chickou or turkey if desired.

Potato Soup.—Boil and mash potatoes, about three pints when mashed, to three quarts of rich heef stock, ready boiling, add pepper and salt to the taste, stir gradually into the hoiling stock, then pass all through a sieve and return to the eoup kettle; simmer five minutes, and serve with fried bread, or one head of celery, two spoonfuls of rice may he put to the stock, well hoiled and the potatoes added, when all are done, then pass through the sieve, return to the soup kettle, simmer five minutes and serve.

Cleanliness.—A neat, cleau, fresh-aired, sweet, cheerful, well arranged house exerts a moral influence over ite inmates, aud makes the memhers of a family peaceable and cousiderate of each other's feelings and happiness. The connection is ohvious hetween the state of mind thus produced and respect for others, and for those higher duties and ohligations which no laws can enforce.

On the contrary, a filthy, squalid, noxious dwolling, in which none of the decencies of life are observed, contrihutes to make ite inhahitaute selfish, sensual, and regardless of the feelings of others; and the constaut indulgence of such passions rendors them reckless and brutal.

The Economy of a Damper.

A damper in a stove is of great importance in a house—hoth as a matter of economy, and comfort also. It makes the hot air remain in the stove, and does not take in the outside heated air, which is done through the crevices and proper draft. If the damper is shut, you instantly feel the heat, on your face, showing that it is thus kept in the room. The circulation is thus kept etopped iu the room, aud a soft, pleasant atmosphere is the result.

The maiu item is, however, the economy in fuel. Not more than half the quantity of wood ie used, and yet an equal amount of heat is generated. This is of some consequence to the purchaser, or to the boy or man who has it to chop; and of course, has an extra amount to furnish, when it goes roaring up the chimney. Then to the housekeeper, the fact that she gaius more ashes hy the use of a damper, is an inducement to use one, as they are uot lost in the air.

Dry hard wood is positively necessary, where a damper is used. Maple will make a nice bed of coals. Birch comes next, though tho flame is not so hot and bright as the former. The beech blazes well, hut is too much like soft wood. When the hlaze is gone there is not much left of it. With a damper you can use soft maple. It is often the case that when there is not a damper, the fire is continually "going down," the heat is unequal, and the temperature of the room is being continually rendered cool—first dry, then damp, making it dieagreeable and dangerous. This matter is of the utmost importauce to the housekeeper, and should be attended to.—*Western Rural.*

Mechanical Hints.

A Toothless Saw.—A smooth, toothless, circular saw, making 3,000 revolutions per minute, for sawing large heams, guidee and ehafts of iron in a cold state, is in operation hy the Phœnix Iron Company of Peunsylvauia.

Propulsion. A wheel has been iutroduced for the propulsion of boats in shoal water, which is provided with arms having spurs which revolve upon the hottom of the canal or river. The plan was thoroughly tried on the head-watars of the Alleghany river, some years ago, but proved an entire failure.

The turn-table of the new Rock Island bridge weighs oue hundred and fifty tons. It is supposed to be the most massive piece of machinery of its kind in the world. It is certain that nothing in the line in this country approaches it. The principal circles, composed of eix segments, weighing six tous each, aud the hase circle, are in their places.

Useful Cement.—The following cement is found to he excellent for use in casee where it is desirahle to join or close vessels for containing the vapor of acids, or highly corrosive substances: Beat and sift finely dry pipe clay; add paiuters' drying oil, and mix, in a mortar, to a moulding cousistency. Use this lute in cylinders, flatteued, and applied to the joinings. The points to which applied must he perfectly clean aud dry.

Joining Rubber. — Ruhher is easily joined and made as strong as an origiual fahric, by softening hefore a fire and laying the edges carefully together, without dust, dirt or moisture hetween. The edges eo joined must he freshly cut in tho heginning. Tuhing can be united by joining tho edges around a glass cylinder, which has previously heen rolled with paper. After the glass is withdrawn the paper ie easily ahetracted. Sift flour or ashes through the tube to prevent the eides from adhering from accideutal contact.

New Power.—A Philadelphia mechanic claims to have invented a hydro-pneumatic engine which hy means of one pound of water will produce one thousaud pounds of power. The agents employed are air and water, hy a new method of applicatiou. If this power is one-third of what is claimed for it, steam, turbines, etc., have seen their last days. We await further developments with impatience.

The Sand Blast.—The process of cutting glase and etone hy the sand hlast, which we have already fully described, has heen the subject of further experiment, which justified the helief that it will eventually come into geuoral use, cheapening many procesees which now require skill lahor at high cost. It is believed to be availahle for many purposes besides that of ornamentation.

JOHN TAYLOR & CO.,

IMPORTERS OF AND DEALERS IN

ASSAYERS' MATERIALS,

Chemical Apparatus and Chemicals,

Druggists' Glassware and Sundries,

PHOTOGRAPHIC GOODS, ETC.,

512 and 514 Washington street, SAN FRANCISCO.

We would call the special attention of Assayers, Chemists, Mining Companies, Milling Companies, Prospectors, etc., to our large and well adapted stock of

ASSAYERS' MATERIALS

—AND—

Chemical Apparatus,

Having been engaged in furnishing these supplies since the first discovery of mines on the Pacific Coast.

WE ENUMERATE IN PART:

Assay Balances—L. Oertlings, London.
Assay Balances—Becker & Sons, Antwerp.
Chemical Balances—Becker & Sons, Antwerp.
Ore or Pulp Balances—Becker & Sons, Antwerp.
Assay Weights—Grains and Grammes.
Bullion Balances and Weights.
Humid Assay Apparatus.
Iron Furnaces—Improved, Lined with Fire Brick for Cupelling and Melting.
Tongs, Muffles, Cupel Moulds, Assay Moulds, Scorificrs, Roasting Dishes, Annealing Cups, French Clay, Assay Crucibles, Hessian (or Sand) Crucibles.
Dixon's Celebrated Black Lead Crucibles and Covers—all sizes.
Assayers' and Chemical Glassware and Assayers' Hardware - a full assortment.
Steel Stamps for bars cut to order.

ACIDS AND CHEMICALS.

Acid in carboys and bottles, commercially and chemically pure.
Bi Carb. Soda, Borax, Bone Ashes, Litharge.
Assay Lead in bars, rolled and granulated.
Black Oxide Manganese, Sodium and Sodium Amalgam, Sulphate of Copper, Quicksilver, and all Chemicals and Reagents required by Assayers and Milling Co.'s.

☞ Our Gold and Silver Tables, showing the value per ounce Troy at different degrees of fineness, and valuable tables for computation of assays in Grains and Grammes, will be sent upon application.

24v23-tf JOHN TAYLOR & CO.

Varney's Patent Amalgamator.

These Machines Stand Unrivaled.

For rapidity pulverizing and amalgamating ores, they have no equal. No effort has been, or will be spared, to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the apperture and between the grinding surfaces,—Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Setlers made on the same principle excel all others They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill-men are invited to examine these pans and setlers for themselves, at the office, 229 Fremont Street, San Francisco.

The California Powder Works

No. 314 CALIFORNIA STREET,

SAN FRANCISCO.

Manufacturers and have constantly on hand

SPORTING,

MINING,

And BLASTING

POWDER,

Of SUPERIOR QUALITY, FRESH FROM THE MILLS. It being constantly received and transported into the interior, is delivered to the consumer within a few days of the time of its manufacture, and is in every way superior to any other Powder in Market.

We have been awarded successively

Three Gold Medals

By the MECHANICS' INSTITUTE and the STATE AGRICULTURAL SOCIETY for the superiority of our products over all others.

We also call attention to our

HERCULES POWDER,

Which combines all the force of other strong explosives now in use, and the lifting force of the BEST BLASTING POWDER, thus making it vastly superior to any other compound now in use.

A circular containing a full description of this Powder can be obtained on application to our Office.

16v20-3m JOHN F. LOHSE, Secretary.

The Geological Survey.

The following just remarks occur in a pamphlet treating of the reclamation of Marsh and Swamp lands, and proposed canals for navigation and irrigation in California by J. Ross Browne:

Nothing could show more conclusively the practical value of the State Geological Survey than the maps prepared from original surveys made during the past nine years, under the direction of Prof. Whitney, the State Geologist. The work has been done with great skill and care, and will compare favorably with the best work of a similar kind done in Europe. Already the sectional maps published have become essential to a knowledge of our mountain and river systems. Without the labors of the survey we would have no data upon which to base any reliable calculation as to the extent of our mineral belts or the area of our water-catchment. A detailed and accurate map of California, such as that in course of preparation and nearly completed by the Geological Survey, is not less important to the understanding and development of our material resources than the elaborate coast survey are to the purposes of commerce and navigation. No intelligent person gifted with common sense, will deny that the survey of our coasts, bays and harbors, under responsible supervision, is indispensable to enlarged commercial intercourse. No civilized nation at the present day is without it. Millions of money have been devoted to this great work by the government of the United States, and no expenditure of public money has proved more beneficial to the commerce of the country.

The charts of the coast survey bear to commerce and navigation the same relation that the surveys and maps of the geological surveys bear to mining and works of internal improvement. It would be as hazardous to undertake the construction of any extensive system of ditches or canals without an accurate map showing the area of water-catchment, the elevation and inclination of the mountain ranges, with their ridges and spurs, as to attempt the navigation of our inlets, bays or harbors, without the measurements and soundings of the coast survey. If Professor Whitney had accomplished nothing more than the accurate delineation of the Sierra Nevada and Coast Range systems, surveyed and defined our mineral belts, furnished to the world the maps already published, and nearly completed the great central map, extending from Owen's Lake to Lassen's Peak, he would merit the gratitude of every citizen, and the unanimous approval of the Legislature. The work is thoroughly and conscientiously done. It would be alike discreditable to the State and injurious to every public enterprise now projected to leave it unfinished. A liberal appropriation should be made to enable the State geologist to complete his work in a thorough and satisfactory manner. It will prove the best investment of public money ever made by the State of California.

The following important resolution was recently been adopted by the San Francisco Chamber of Commerce:

Resolved, That the State Geological Survey, under the direction of Professor Whitney is accomplishing a great and beneficial work in the survey and delineation of our mountain and river systems, in the investigations of our mineral resources and the elucidation of the Natural History of the Pacific Coast, and that we earnestly recommend the continuance of this survey, and its liberal support by the Legislature.

The opinions that we have advanced concerning the practical utility of the Geological Survey, are, we are pleased to see, also adopted by men of business who are accustomed to look at things from a business point of view. The members of the Chamber of Commeroe have been called upon to test the value of the topographical work of the survey, in some of their reclamation and irrigation enterprises and are able to appreciate the necessity of completing the work in order that a perfect map of the whole State may be prepared.

This voluntary testimony of practical utility by so influential a body as the Chamber of Commerce should have great weight with the members of the Legislature and call their attention forcibly to the objects and accomplished work of the survey. It would certainly be a great shame if so neccessary a task as that entrusted to Professor Whitney, and one so important to the State, should fail for want of an adequate appropriation, especially since so much has already been accomplished.

The Belcher Mine.

The annual meeting of the Belcher Mining Company was held on January 30th. The Secretary's report shows the following schedule of operations for the year:

RECEIPTS.

From bullion	$1,199,135
Assessments Nos. 7 and 8	51,925
Virginia and Truckee Railroad	1,036
Total receipts	$1,252,096
Cash January 31, 1871	624
Total	$1,252,720

DISBURSEMENTS.

Labor	$137,103
Crushing 18,468 tons ore	221,621
Hoisting 18,458 tons ore	19,203
Machinery account	11,000
Miscellaneous	150,847
Total disbursements	$539,775
Cash, January 1, 1872	712,945
Total	$1,252,720

The ore yield of this mine for the past year was all due to the last five months of the year. The quantities hoisted in each month, together with average and aggregate values, were as follows:

	Tons.	Average.	Value.
August	680	$74.90	$50,936
September	2,009	80.19	161,103
October	4,200	74.52	313,041
November	5,717	60.40	345,419
December	5,853	55.83	326,036
Totals	18,468	$64.26	$1,199,135

The Assay Value of the Bullion.

The assay value of the bullion was 54 per cent. gold and 46 per cent. silver. From the balance of $712,945 held on the 1st January, the company paid a dividend of $10 per share, aggregating $104,000.

The Dividends Paid

Under the old organization were as follows: June 1, 1865, $21 per foot; July 1, $24; August 2, $24; December 31, $24; January 28, 1865, $51; February 25, $60; March 28, $75; April 28, $75; May 30, $51—making a total of $405 per foot, aggregating $421,200 paid by the mine prior to the dividend paid January 10, 1872.

The Assessments Levied

In the meantime have been as follows: December, 1865, $100 per foot; April 10, 1866, $60; July 21, $45; October 17, $33; January 1, 1867, $15; March 25, $12; May 30, $15; September 21, $15; December 27, $15; March 13, 1868, $25; July 13, $25; October 6, $25; December 31, $25; March 15, 1869, $30; May 4, $50; October 21, $25; —making a total of $515 per foot, or $535,600, including $109,200 levied since the reorganization of the Company.

Officers Elected.

The following Trustees were chosen for the ensuing year: J. D. Fry (President), A. K. P. Harmon (Vice President), B. F. Sherwood, R. F. Morrow and James H. Dobinson. H. C. Kibbe was re elected Secretary and William H. Smith was reappointed Superintendent.

An illustration of a lamp appears a second time in a portion of our edition this week, placed there by mistake, something that does not often occur with us.

Mocking Birds have been turned loose at Los Angeles with the hope that they will multiply and live permanently in the open air.

FOR 25 CENTS we will send, postpaid, four sample copies (recent numbers) of the Press. This, we believe, will induce many to subscribe who have not yet read our paper. It is a cheap and valuable favor to send a friend anywhere.

The Explorers', Miners' and Metallurgists' Companion. By J. S. Phillips, M. E. San Francisco Dewey & Co. This work, as the author tells us, embraces "the whole field of mining, which," he goes on to say, "is sufficiently hazardous at the best, having too many blanks for a prize to sustain unnecessary errors arising from insufficient preliminary examination." Besides that there is much actual knowledge to be gained from a perusal of this volume, and in this respect alone it will be a valuable assistant to those engaged actively in mining. There is also a considerable amount of good common sense, which, by appealing to those even remotely connected with this fascinating subject, may cause them to seek for such reforms in the management as may lead to the classing of mining among what may be termed legitimate business, and so do away with all worthless schemes, which have made it in America hitherto little better than another species of gambling.—*S. F. Chronicle, Dec. 24th.*

The Evangel, Office, 414 Clay street, San Francisco. Terms, $4 per year, in advance. The Evangel is the organ of the Baptist Denomination for the Pacific States and Territories. All efforts on the part of brethren and friends to extend its circulation will be gratefully appreciated. $3, for one year's subscription, will be received from new subscribers, strictly in advance. Address "Evangel, San Francisco, Cal." Sample copies furnished free. 4v3-1amhptf

MARAVILLA COCOA.—No breakfast table is complete without this delicious beverage. The *Globe* says: "Various importers and manufacturers have attempted to attain a reputation for their prepared Cocoas, but we doubt whether any thorough success had been achieved until Messrs. Taylor Brothers discovered the extraordinary qualities of 'Maravilla' Cocoa. Adapting their perfect system of preparation to the finest of all species of the Theobroma, they have produced an article which eupercedes every other Cocoa in the market. Entire solubility, a delicate aroma and a rare concentration of the purest elements of nutrition, distinguish the Maravilla Cocoa above all others. For homœopaths and invalids we could not recommend a more agreeable or valuable beverage." Sold in packets only by all Grocers, of whom also may be had Taylor Brothers' Original Homœopathic Cocoa and Soluble Chocolate Steam Mills—Brick Lane, London. Export Chicory Mills, Bruges, Belgium. fe25-1y

Ripe and Luscious Melons the Year Round!

Seeds for Sale.—The Seeds of the fameue TURKISH MUSKMELON (which keepe in palatable condition in winter and summer) are now offered for sale (for the first time in America) at thie office. They are said to be excellent for preeerves and sweet pickle, and euperior to citrons or other melons. We have the sole wholesale and retail agency of the introducer, on this Continent, R. Marchella, of thie State. Small packages, by mail, 50 cts., prepaid to any part of the United States. It is a choice novelty. Send in season. The supply is net large.

Mining Companies

Should advertise their Meetings, Assessments, and Sales, in the Scientific Press. Rates more than one-half less than daily publications. Stockholders should take the hint and request their managers to truly economize by advertising in a Mining Journal, where all notices may be seen by cheaply purchasing and examining a weekly. You will thus save money and uphold a journal which upholds your interests.

University of California.—The Preparatory Department is under the charge of five Professors of the University, and six tutors.

Besides the studies of the public schools, Algebra, Geometry, Latin, Greek, German, French, Spanish and Book-Keeping are taught.

BLAKE'S PATENT STEAM PUMPS.

WHAT IS SAID BY THOSE WHO USE THEM.

SALEM, Oregon, January 16th, 1872.

MESSRS. BERRY & PLACE, San Francisco—Gentlemen: In answer to your query regarding the working of the large Blake Steam Pump, our company purchased of you, we would say in all sincerity that the pump *has exceeded our expectations.* It has been in use since the 25th of September, 1871, and has thus far given the most perfect satisfaction. It does its work with ease, does not get out of order, and requires but little or no attention to run it. It is SIMPLE, DURABLE, and PERFECT in its construction. We have found it entirely satisfactory and just the pump *in every respect* needed for our work.

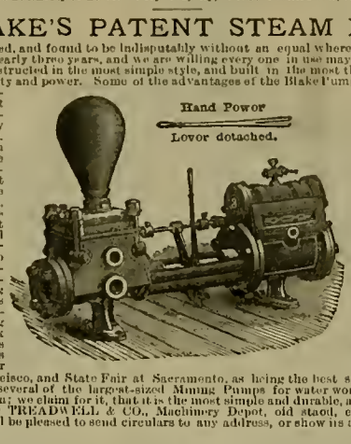
Yours, respectfully, W. F. BOOTHY, Sup't. Salem Water Works.

PHŒNIX MINE, Napa County, January 10th, 1872.

MESSRS. BERRY & PLACE, San Francisco—Gentlemen: The No. 8, Blake Steam Pump we bought of you last fall is doing good service. We are having a large amount of water to contend with during this stormy weather; but the pump throws it all out of the main shaft (180 feet deep) with perfect ease, and is only working from 40 to 80 strokes a minute. It is a complete pump and no mistake. We are well satisfied with its working, and if you wish to use the name of our company, as a reference, you are at liberty to do so. Very resp'tly, GEO. FELLOWS, Supt. Phœnix Quicksilver M. Co.

BLAKE'S PATENT STEAM PUMP.

These Pumps have been tested, and found to be indisputably without an equal wherever tried. They have been sold in the Pacific States now for nearly three years, and we are willing every one in use may be referred to; every Pump will speak for itself. They are constructed in the most simple style, and built in the most thorough manner—especially calculated for simplicity, durability and power. Some of the advantages of the Blake Pump may be summed up as follows:



It is positive under any pressure. May be run slow or fast as may be desired. Will discharge more water than any others of the same dimensions. Has no leaky joints, the steam part being cast in one entire piece. The steam valve is perfectly balanced, is cushioned at each end, and slides with the *greatest facility having no cams, nor complex rotary arrangements to get out of order.* Will start at any point of the stroke, and will discharge all the water of condensation. The Pump has no crank or fly-wheel, thereby saving a considerable item of expense to the purchaser. Having *no lived joints,* it therefore needs no watching, and is consequently ready to start without using a starting bar or any hand work whatever. The Blake Pump is extensively used on Railroads and Steamboats, in Hotels, for Mining and Fire purposes; in Breweries, Tanneries, Sugar Houses, Factories, Mills, Laundries, and as Boiler Feeders, wherever steam is employed. In fact, wherever water or other liquids are desired to be raised in large or small quantities, or against heavy or light pressure, it is the cheapest and best Pump that can be used. It is offered to the public as the most perfect independent steam Pump ever invented. Forty different sizes are made, capable of throwing from 1,000 to 200,000 gallons an hour, and adapted to any class of work that may be required. Every pump will be warranted to perform the work required of it by the purchaser, or it may be returned and the money will be cheerfully refunded. The Blake Pump was awarded a silver Medal at the last exhibition of Mechanics' Institute, San Francisco, and State Fair at Sacramento, as being the best steam Pump on exhibition. The agents have recently imported several of the largest-sized Mining Pumps for water works, and deep mines, and will be pleased to refer parties to them; we claim for it, that it is the most simple and durable, and consequently the best Steam Pump ever built. For sale by TREADWELL & CO., Machinery Depot, old stand, corner of Market and Fremont streets, San Francisco, who will be pleased to send circulars to any address, or show its advantages to parties calling on them.

OFFICE STARR MILLS, VALLEJO, Cal., January 13th, 1872.

MESSRS. BERRY & PLACE, San Francisco—Gentlemen: We are pleased to state that the No. 3 Blake Pump purchased of you, has constantly supplied our three boilers for the past year, with water heat to above boiling point with one of Armstrong's Patent Heaters. It has given us no trouble nor expense, and has in fact fully come up to your recommendations.

Yours, Etc., STARR BROS. & CAMPBELL.

OFFICE S. J. WOOLEN CO., SAN JOSE, January 29th, 1872.

MESSRS. BERRY & PLACE, San Francisco—Gentlemen: We have used a No. 6 Blake Steam Pump now for about two years, both as a Tank Pump and as a Fire Pump in case of need: and it has given excellent satisfaction. *Trusts us in every respect.*

Very respectfully, R. F. PECKHAM, Pres't San Jose Woolen Co.

BELMONT, Cal., February 6th, 1872.

MESSRS. TREADWELL & CO.—Gentlemen: In reply to your inquiry concerning the large Blake Steam Pump, purchased of Berry & Place, by Mr. Ralston, I will say, that it gives ENTIRE *satisfaction,* even working as it now is, where no other Pump could; for it is *at present six feet under water,* yet it does its work PERFECTLY.

Yours, Etc., J. E. BUTLER, Supt. Water Works and Engineer at W. C. Ralston's.

It has no Cams or Rotary Complex Valves. It has stood the test wherever tested.

IT IS SIMPLE, COMPACT, DURABLE, AND POWERFUL.

☞Manufactured by Geo. F. Blake & Co., Boston, who build and have on hand a larger variety of Steam Pumps than any other concern in the country, embracing *forty* different sizes, and capable of throwing from 1,000 to 200,000 gallons an hour, and adapted to every description of work required. ☞Send for circular and prices.

TO QUARTZ MINERS AND MILLMEN.

Three years since we established in connection with our Crockery and Silver Plated Ware Business, a Factory for Silver Plating by electro process all wares which we had previously imported ready plated from Eastern factories.

Our enterprise, assisted by the liberal patronage of the Builders and Plumbers, has proven a success; and having subsequently added to our business that of SILVER PLATING COPPER PLATES for AMALGAMATING PURPOSES, we desire to inform the Miners and Millmen of California and Nevada, that we have recently perfected such improvements as to enable us to furnish at very short notice Silver-plated Amalgamating Plates, having a smoothness and finish of surface never before attained in California.

Orders for special sizes sent by mail will receive prompt attention. References from those who have used our Plates will be furnished to those desiring them

THE HIGHEST PREMIUM

Awarded by the Mechanics' Institute Fair, San Francisco, and State Fair, Sacramento, 1871.

Thcee Lubricatore are acknowledged hy all engineere to be superior to any they have ever used; feed constantly hy preesure of condensed water, supplied by pipe A, regulated under the oil by valve J, and forced out through check valve and pipe B into the steam pipe C; it then hecomes greasy steam, passes to all the valves and cylinder at every stroke of the engine; glass tnhe I indicates amount used per hour. Packing on rods and stems laste longer, and the rines on the piston will not corrode. One pint of oil will last from three to six daye, according to speed and size of engine; I, sliding gauge; K, valve to shut off when engine stoppe; H, F, valves to shut off in case of frost; steam does not enter the cup; it is always cool; warranted to give satisfaction. Patented February 14, 1871. Manufactured by California Brass Works, 125 First street, S. F. 24v23tf

THEODORE KALLENBERG, MACHINIST,

nd Maker of Models for Inventors. All kinds of Dies, Stamps and Punches made. Also, all kinds of Small Geare Cut.

Repairing done on very Reasonahle Terms and in the hest manner. No. 32 Fremont street, S. F. 19v23-3m

Notice is hereby given, that the copartnership heretofore existing hetween A. J. Severance, Charles W. Randall and J. Gus. Burt, under the firm name of "Severance, Holt & Co.," is this day diseolved hy mutual consent. A. J. Severance, having purchased all the interest of his late partnere, will continue the husiness of manufacturing and selling Diamond Drills, as hefore, under the style of A. J. Severance & Co.

Dated San Francisco, Nov. 24, 1871.
Office, 315 California street. A. J. SEVERANCE,
CHAS. H. RANDALL.
22-v23-tf J. GUS. BURT.

WHY THE WILSON

Patent Steam Stamp Mill

IS THE BEST AND

Most Desirable Mill for Crushing Ores.

Because the company give a responsible guarantee that the purchasers shall be under no expense for repairs for TWELVE MONTHS, and guarantee the mill to crush (regular work) One Ton Per Hour of the Hardest Quartz through the ordinary screens.

THERE IS A SAVING

of from Twenty to Forty per cent. running expenses.

To put one of the Wilson Mills over the mountains, from $10,000 to $18,000 is saved in First Cost.

The Wilson Mill will save in working expenses and repairs enough every six months to PAY FOR ITSELF.

IN EVERY PARTICULAR

This Mill is Greatly Superior to the

Ordinary Cam Stamp Mill.

RECOLLECT

This Mill is Fully Guaranteed

to do and be all we claim for it.

DO NOT BE DECEIVED

by the cry of "Humbug," but call and investigate its merits. One can always be seen at the Pacific Iron Works.

Ten of these Mills are now in operation.

For further particulars address

FURMAN R. WILSON,
San Francisco.

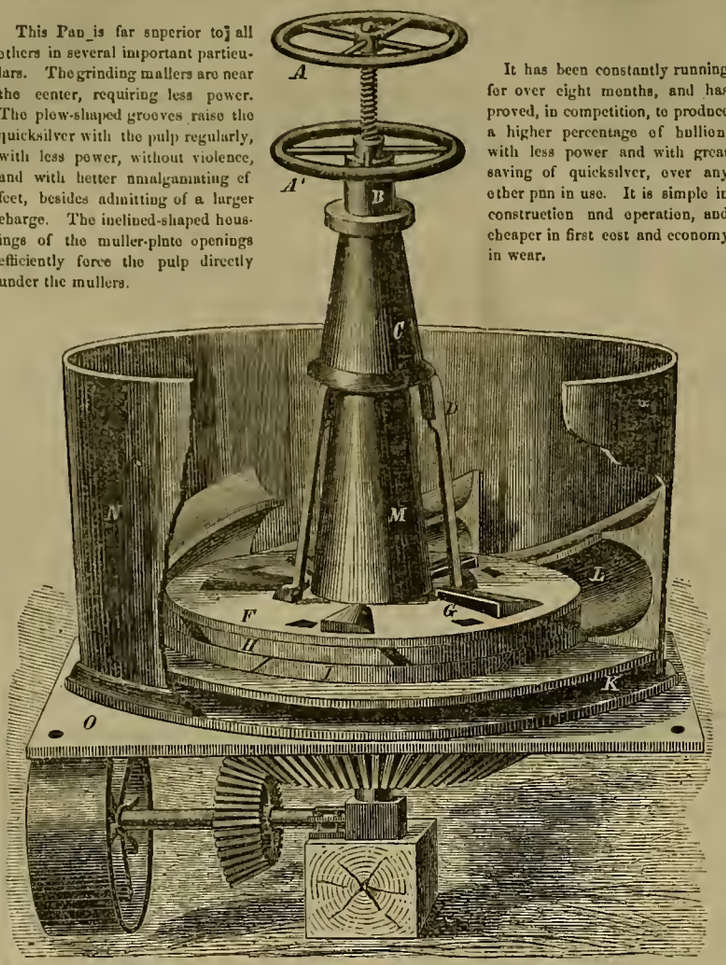
STEVENSON'S PATENT MOULD BOARD AMALGAMATING PAN.

This Pan is far superior to all others in several important particulars. The grinding mullers are near the center, requiring less power. The plow-shaped grooves raise the quicksilver with the pulp regularly, with less power, without violence, and with better amalgamating effect, besides admitting of a larger charge. The inclined-shaped housings of the muller-plate openings efficiently force the pulp directly under the mullers.



It has been constantly running for over eight months, and has proved, in competition, to produce a higher percentage of bullion, with less power and with great saving of quicksilver, over any other pan in use. It is simple in construction and operation, and cheaper in first cost and economy in wear.

Manufactured at the Golden State Iron Works (Co-operative). 19 First street, S. F.

Where it can be examined and further particulars be learned; or persons may apply to the inventor and patentee, Mr. C. O. STEVENSON, at the Douglas Mine, Gold Hill, State of Nevada, where the Pans have long been in constant operation. 15v20-1mr,1amtf

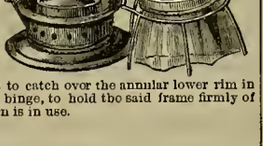
HUGHES' PATENT
REMOVABLE GLOBE LANTERN.

Since the time when King Alfred made the first lantern by surrounding a candle with a transparent casing of horn, this class of appliances has been one of the greatest utility and most extended use. Among the latest improvements in its construction is that illustrated in the accompanying engravings, and designed to secure the threefold object of providing for the easy cleansing of the glass portion, the secure retention of the upper in place upon the lower part of the lantern, and the affixing of the ball to the top of the lantern in a durable and efficient manner. The base of the lantern is provided with the usual detachable lamp, and at one side has hinged to its upper edge a wire frame designed to carry and protect the glass portion or body of the lantern, and at the upper end of which is the cylindrical top, perforated in the ordinary manner to permit the escape of the products of combustion from the lamp. Arranged at that side of the base opposite the hinge is an angular spring-catch so applied as to catch over the annular lower rim in the wire frame, and in conjunction with the hinge, to hold the said frame firmly of place upon the base as required when the lantern is in use.



This Lantern is offered as

The Best and Most Desirable in Use,

all things considered. Its price is reasonable, and when once tried no other will be accepted.

Individuals, Dealers, Railroad Companies, and all persons and institutions about to purchase Lanterns, should inquire for this kind; and if not for sale in your locality, address the inventor for circular of full description, price list, etc.

Patented August 10 and December 28, 1869, by

JOHN HUGHES.

AMBLER'S BLOWPIPE FURNACE,
For Roasting Rebellious Ores.
The new roasting furnace is the CHEAPEST AND BEST yet offered to the public. By furnishing an ample supply of oxygen to the ore while roasting, thorough oxydization of the sulphurets is secured at a small cost.
It is Adapted to All Kinds of Ores.
A description and illustration of this Furnace was given in the Scientific Press of November 25th.
For terms, circular, and further information, address the agent of the inventor,
MONROE THOMSON,
At 444 California street, San Francisco, until further notice. 5v23-3m

The Scientific Press is the Oldest and Largest Practical Mining Journal in America.

Established in 1860, this weekly has steadily advanced in size, ability and interest. Its chief editors and publishers have had over fifteen years successful experience in conducting this and other journals in California.

Its editorials are carefully prepared with an honesty and accuracy that maintains its reputation as the best authority on mining matters in the country.

It is published in the best location in the world for furnishing the largest amount of valuable information to the gold and silver miners and metallurgists everywhere.

Its correspondents and subscribers are to be found in nearly all the mining districts of CALIFORNIA, NEVADA, IDAHO, MONTANA, UTAH, ARIZONA, COLORADO, and in MEXICO and other foreign countries.

Over 10,000,000 Dollars!

Have doubtless been saved to the miners of the Pacific Coast by reading this journal, each issue of which contains some two pages of MINING SUMMARY from the most important districts in the U. S.; from one to two pages concerning NEW INCORPORATIONS, SHARE MARKET. MINING CORRESPONDENCE, COMMUNICATIONS, etc., and from two to three pages of EDITORIALS (with illustrations) of NEW MACHINERY, NEW DISCOVERIES, PROCESSES, and operations in MINING, MILLING, ROASTING of ORES, ASSAYING, etc.

One feature of our journal consists in presenting in each issue a POPULAR VARIETY of highly interesting matter, useful and instructive for all intelligent readers, systematically arranged in departments under headings entitled Mechanical Progress; Scientific Progress; Mechanical Hints; Home Industry; New Discoverics; Good Health; Domestic Economy, etc., rendering its reading pleasant and profitable at the OFFICE, SHOP AND FIRESIDE.

Yearly subscription $4 per annum. Single copies 10 cents. Four sample copies (of recent dates) furnished for 25 cents. List of California mining books sent free. DEWEY & CO., Publishers, Patent Agents and Engravers, No. 338 Montgomery street, San Francisco.

PACIFIC RURAL PRESS,

A FIRST-CLASS

Illustrated Agricultural Paper.

It is one of the Largest, best Illustrated and most Original and Enterprising Agricultural Journals in America, and has no rival on the western side of the Continent. Its circulation is Rapidly Increasing, and it is Very Popular with its Patrons.

A NEW HUSBANDRY,

as it were, is required on the Pacific Coast, on account of its peculiar seasons, soil, climate and topography. The new discoveries, ideas, and useful hints evolved in its rapid progress, are to be observed with interest, and read, as reported in the PACIFIC RURAL, with profit by practical and progressive agriculturists everywhere. Sample copies of the PRESS, post paid, 10 cts. Subscription, $4 a year.

DEWEY & CO., Publishers,
No. 338 Montgomery St., San Francisco, Cal. Nov., 1871

COMPLETE VOLUMES

Of the SCIENTIFIC PRESS can be had from January 1, 1864, to date, at $3 per single vol. or $6 a year. They afford the cheapest and best information on mining and the industry of this coast of any work published.

Also—Bound volumes of the PACIFIC RURAL PRESS furnished at same rates from its commencement.

Dewey & Co., U. S. and Foreign Patent Solicitors and Counsellors, Scientific Press Office. Principal Agency for the Pacific States. Established 1860.

OUR U. S. AND FOREIGN PATENT AGENCY presents many and important advantages as a Home Agency over all others by reasons of long establishment, great experience, thorough system, and intimate acquaintance with the subjects of inventions in our own community. All worthy inventions patented through our Agency will have the benefit of an illustration or a description in the SCIENTIFIC PRESS. We transact every branch of Patent business, and obtain Patents in *all civilized countries*. The large majority of U. S and Foreign Patents granted to inventors on the Pacific Coast have been obtained through our Agency. We can give the best and most *reliable* advice as to the patentability of new inventions. ADVICE AND CIRCULARS FREE. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior.

ENGRAVING ON WOOD, of every kind, for illustrating machinery, buildings, trade circulars, labels, plain or in colors, designed and cut in the best style of the art by experts in our own office. Also, engraving on metals.

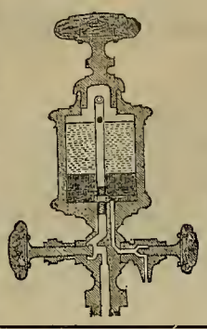
STEAM CYLINDER LUBRICATOR.



NATHAN & DREYFUS'

PATENT SELF-OILERS

And Cylinder Cups

Save from 75 to 95 per cent. of Oil. No better investment for the amount can be made by any person having machinery or running shaftiug. They are so well known as to need no description. All the trouble of "oiling up" is avoided. There is no waste of oil, and no cans are needed. A single trial will prove their value.

We will put them into any mill, and if not perfectly satisfactory, they may be returned at our expense, and the price will be refunded. We have a large stock on hand, of all sizes, adapted to all descriptions of boxes.

Send for Price List and Circular.

TREADWELL & CO.,

1y24-eow-tf Corner Fremont and Market Streets, San Francisco.

THE GIANT POWDER COMPANY

Are now manufacturing besides the famous regular

GIANT POWDER, A NO. 2 GIANT POWDER,

Somewhat slower in its Explosion, which we recommend for

BANK BLASTING, COAL MINES,

AND FOR ALL SUCH WORK WHERE THE ROCK IS NOT VERY HARD

It is fully as safe as the other and evolves neither smoke nor noxious fumes when exploded.

Price. 50 Cents per Pound.

The sales of both grades increase very fast, which is the best proof of their superiority over other explosives.

BANDMANN, NIELSEN & CO.,
20v22-3m16p General Agents, No. 210 Front Street.

San Francisco Office, 331 Montgomery street (Stevenson's Building), Room 32, Third floor.

J. BERTON, President.
E. P. HUTCHINS, Secretary.

N. B.—Application for Registry, or Examination and Report on Mining Property, may be made to the Secretary, San Francisco office.

SCIENTIFIC PRESS.

AN ILLUSTRATED JOURNAL OF SCIENTIFIC AND INDUSTRIAL PROGRESS,

Mining, Mechanic Arts and Inventions.

BY DEWEY & CO., Patent Solicitors.

SAN FRANCISCO, SATURDAY, FEBRUARY 17, 1872.

VOLUME XXIV. Number 7.

The Chlorination Process.

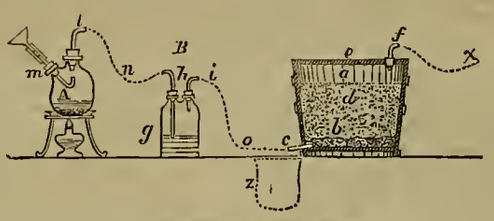
We have at different times given accounts of this process, which is based on the property of metallic gold being changed into a soluble chloride of gold when in contact with chlorine gas, and many of our readers are familiar with its detail. A description, however, of how to be sure of a result on a large scale will be interesting, since it is easy to make an experiment with 20 or 30 pounds of sulphurets or ore. The chloride of gold can be dissolved in water, separated from the ore by lixiviation, and and then precipitated in a metallic condition by a solution of sulphate of iron. Mr. Kustel, in his "Roasting of Gold and Silver Ores,"* gives the following interesting method of making the test alluded to above:

The named quantity must be roasted first, and it is the most difficult task, requiring either a small furnace or a great deal of patience, especially when small charges are treated on a large piece of sheet iron, having a charcoal fire beneath. In either case the sulphur must be driven out perfectly, so that when in a glowing condition, no smell of sulphurous acid can be observed. When finished, a sample is taken for an assay, and the roasted stuff moistened with water, after the weight of the whole has been noted.

A common water bucket is then prepared to receive the moistened ore, which must not be too wet, but only moist enough to allow its being sifted. On the bottom of the bucket, *a*, (See Fig.) some clean rock or broken glass is placed about two inches deep, and covered with a piece of moistened canvas. A short glass pipe, *c*, two-eighths of an inch in diameter, is inserted close above the bottom.

The ore, *d*, is then introduced, filling up two-thirds or less of the space as loosely as possible, and covered with a wooden or iron cover and pasted all around with dough. The cover is provided with a short glass tube, like *c*, to which an india rubber tube, *f*, for carrying the gas out of the room is attached. Both glass tubes, *c* and *f*, must be likewise secured with dough.

The chlorine gas is generated in a glass vessel, *A*. There are two corks in it, each having a glass tube, as represented in the drawing. The cork, *l*, is removed and the vessel charged with 3 ounces of peroxide of manganese, 4 ounces of common salt, and 4½ ounces of water—all of which are well mixed. The cork is inserted again and well secured with dough. Another vessel, *B*, provided with two necks, contains water as indicated by *g i*; the glass tube, *h*, dips about one-half inch into the water. The corks are made air tight like the others in *A*. The whole apparatus is now joined together by rubber pipe, *n* and o, fitting tightly to the glass tubes. Having all thus prepared, 7½ ounces of sulphuric acid are poured through the safety-tube, *m*, but only in small portions and at intervals. When the bubbling of the water at *g*, in the vessel *B*, is not lively enough, some more acid is introduced, and finally the temperature raised by an alcohol lamp. If all the joints have been luted carefully with dough, not the slightest inconvenience will be met with. The chlorine gas from the generator, *A*, is forced through the water in *B*, and by this means washed from muriatic acid. Through the pipe, o, it enters the bucket and ascends slowly till it reaches the cover, escaping then through the rubber pipe, *F*, where it must be examined from time to time by dipping a glass rod into ammonia and holding it to the end of the pipe, *x*, which leads out of the room. In contact with the chlorine the ammonia evolves white fumes, and chlorine can be detected by these means wherever it may escape. The gas is allowed to pass through the bucket as long as chlorine is created. In this condition, by stopping up the pipe, *x*, if no more chlorine is evolved the apparatus may stand until the next day. The cover is then removed, the pipe, *o*, taken off, a clean glass or porcelain vessel, as indicated by *z*, placed below *c*, and warm water carefully poured over the ore till the bucket appears to be full. The solution which comes out at *c*, must be examined at times in a small tumbler with a few drops of a solution of sulphate of iron. If the clear solution remains unchanged, without becoming darker, the lixiviation is finished.



A CHLORINATING APPARATUS.

To the solution in the vessel, *z*, a few drops of muriatic acid and then sulphate of iron, or green vitrol, (dissolved) is added and stirred with a glass rod. The whole is allowed to stand till all the gold is precipitated and the liquid is perfectly clear. This is drawn off by means of a syphon, for which the rubber pipe, *x*, can be used. The remaining fluid and the precipitated gold is gathered on a filter, washed with warm water and dried with the filter in a porcelain cup, above an alcohol lamp. The filter is burned either free or under a muffle, care being taken not to lose a particle of the filter ashes; mixed with some lead it is then cupelled and the gold button weighed. A comparison with the assay shows to what percentage the chloriuation has proceeded.

COAL DISCOVERY.—The Petaluma *Crescent* says that a ledge of coal has been found near the Guallala river. The soil on the mountain side had been so moistened by the heavy rains that a land slide occurred, and laid bare a bed of coal, supposed to be of considerable extent. A schooner load has been shipped to this city to be subjected to test, and if it proves of good quality, the proprietor, John Rutherford, will form a company to begin mining. Coal is known to exist in the Coast range, but that heretofore discovered has been of inferior quality.

THE NEW EUREKA MILL was to have started up this week. It is the largest mill of the kind on the Coast, and when in good order is expected to crush from 150 to 200 tons of ore per day.

The Patent Crab Wrench.

The accompanying cut represents the Patent Crab Wrench, a comparatively recent invention, but one which is coming into extensive use. Its peculiarity consists in the fact that it will grip nuts of all sizes without loss of time in adjusting. It will not slip, for the more pressure that is brought to bear, the tighter it holds. The head is made in two parts and by moving the handle one way it opens, and by turning it the other, it closes mechanically and gives the user the advantage of a leverage to prevent its slipping. It can be used with one hand, as it will grip the nut as soon as the jaw comes in contact with the nut and pressure is brought to bear on it by turning on the handle and closing the jaws.

An important feature is, that the wrench being composed of three pieces, each being stamped and numbered according to the size of the wrench, when any part wears out it may be replaced for a trifling expense, without the necessity of buying a new one. Its self-adjusting properties, rendering it effective for quick work, are great recommendations in its favor. A look at the tool will satisfy any one of its utility. There are four sizes made, which will grip from a 3-inch nut down. They may be seen at Linforth, Kellogg & Co.'s, Nos. 3 and 5 Front street, in this city.

THE PATENT CRAB WRENCH.

A GOLD MINE IN SAN FRANCISCO.—The workmen while quarrying rock on Broadway street, between Kearny and Montgomery, last week, found a small quartz vein containing some traces of gold. A blast was exploded in order to get at its dimensions, but the loose rock and dirt have covered the whole thing up so that it will have to be carted away before any "ore" can be extracted. There have been a number of discoveries of both gold and silver in small quantities on the peninsula of San Francisco, but none of them ever amounted to anything and very few suppose that this will.

THE snow blockade still continues and reports conflict as to when the long delayed mails will arrive.

CLEVELAND AND SIERRA HYDRAULIC MINING CO.—This Company at Scales Diggings, Sierra County, are using 2,000 inches of water, and running night and day, employing 12 men. They use one of Craig's old and one of the new Universal joint pipes, with nozzle 5¼ inches, with streams under 200 feet pressure. They have been running about 30 days and will soon clean up for the first time this season. This company have about 130 acres of gravel in the old channel and where they are working now it is from 40 to 200 fest deep, and but a small portion worked. The Sierra Co. are working another set of hydraulic claims at Council Hill, about two miles from Scales, and four miles from Brandy City, where they use 1,000 inches of water, two streams, one with a 3½, and the other a 4½ in. nozzle, old style pips, under 275 feet pressure; employ five men. The stock is owned partly by residents of Cleveland, Ohio. The company own several ditches, which supply an abundance of water. The water season is unusually early this year, and the prospects are very good for late runs, there being a heavy body of very compact snow on the mountains. Col. A. F. Williams of the above named company informs us that the prospects are fine for an unusually good season with the miners in Sierra County.

WASTAGE OF THE PRECIOUS METALS.—Some months ago we published several letters on the above subject, from the pen of Mr. Almarin B. Paul, which were extensively copied and commented upon by the press of not only the Pacific coast but the Atlantic.

These letters have been revised by Mr. Paul, and much statistical matter added thereto—a large portion of which is compiled from the many letters received by him, from practical miners and mill-men. The facts as set forth clearly establish the enormous waste daily going on, especially in our gold mines and which should arouse the mining community to a sense of their loss and an effort to stay it.

SILVER IN SAN BERNARDINO CO.—The Los Angeles *News* chronicles the discovery of rich and extensive silver-bearing ledges in the Blue Mountains, San Bernardino Co. The range is about 25 miles east of Lane's Crossing, Mojave Valley. One of the ledges has been traced for five miles in length, and varies from ten to sixty feet, cropping out in many places fifteen feet above the ground. The casings are slate, lime and trap rock. The same formation extends for a mile west of the main ledge, and contains a number of smaller ledges. Some old and experienced miners who have seen them, according to the *News*, declare them to be the most massive ledges they have ever known. A piece of the rock is said to have assayed $87 per ton.

SALES. — The Independent, Mountain Rose, Miners' Dream and Eagle mines, Stockton District, Utah, have been sold to New York parties at good figures.

CORRESPONDENCE.

Universal Crop Reports.

EDS. PRESS:—An article from your journal has been extensively copied by the leading papers on this Coast. You attribute therein the suggestion of having our Government obtain the condition of crops throughout the world by telegraphic agency to Lieut. Maury. In several numbers of the *Examiner* I advanced the idea that such information should be given by all nations as a duty to humanity and that our government should ask it under the provisions of an international treaty. I send you a copy of the *Examiner* of July 7, 1870, in which you will find my views at length and which may deserve republication in your journal. In addition I have to state that at my request our Senator, Hon. Eugene Casserly, laid the matter before the authorities at Washington giving my views long ago a favorable endorsement.

PHILIP A. ROACH.

The following is the article from the *Examiner* above alluded to:

The wheat crop is the engrossing subject of attention in the Old and New world. We have had reports by telegraph of short crops in several countries on the European continent, which caused in the present month much active speculation in the grain markets of our country. To what extent a deficiency of supply to meet the demand may exist has not been reliably established. Conflicting interests are at work, and the uncertainty of the reports is doing great damage to the classes who should meet each other on the basis of obtaining a just equivalent under a truthful statement of facts.

Our people as producers, having an immense surplus, are placed, by the condition of affairs, in the position of supplying the wants of millions with abundance at prices that will well remunerate them without exacting famine rates from those whose crops have partially failed. Our immense area of territory sowed in grain is accurately stated annually, according to the most reliable data, by our Agricultural Department at Washington. The yield of the various cereals may be estimated with considerable exactness and were we confined to a home demand the well-known law of consumption would permit the money value of the crop to be at once estimated, and rates per cental of various grains easily established. The home market, however, is always kept in a fluctuating condition by the probable foreign demand; in consequence, prices rule higher to our own consumers, and speculation often runs wild in the expectation of a great demand from abroad which comes not.

California has suffered largely from the uncertainty of foreign production in the countries with which we compete. Such erroneous reports have frequently disturbed our market, and vessels have been detained here because cargoes could not be procured early in the season. Our farmers expected higher prices than the grain purchasers here were allowed to give by their orders. Later, after a heavy bill of storage was incurred, our farmers have sold at lower prices than could have been obtained at an earlier period. This loss in money value falling on our farmers was a general one to the State.

There is an easy remedy for the evil which our Government can apply in a few weeks. We have in all the great grain-growing regions of Europe, Consular agents, who, even now, in the course of thirty days, could ascertain the condition of crops in their respective districts, and inform the Agricultural Department at Washington of what surplus over consumption could be spared. This news, imparted by telegraph to our people, would be reliable enough to enable them to obtain fair prices, by meeting the demand, and not withholding from sale in expectation of getting rates not warranted by the actual condition of crops in other countries.

It may be said that private enterprise now performs this duty, but no matter how well performed, people will not act upon it, and even among the most interested and intelligent classes there are believers and doubters of every report. It wants the impartial action of Government. We publish to the world our supply, and give data to what an extent we will have a surplus; other nations ought to do the same, by our friendly invitation. From many reasons we will find a hearty co-operation that will result in mutual benefit.

Every government has an interest in having the truth in regard to its food supply known. If over abundant it wants the surplus purchased by its neighbors. If short, its duty to its mission requires that commerce should be invited to supply the deficiency in order that hunger may not produce discontent and revolution. There should be an international obligation to perform this duty. The ships that brave the seas ought to know by governmental assistance whither to go for food and where to return with it. Now they seek markets that prove not to be the cheapest—now they bring grain where there is little demand for it, and pecuniary loss follows their enterprise instead of profit.

Our Agricultural Department is well organized for one branch of its service, and renders immense benefit to our people. It tells us what we have produced, but it should go further; by means of our Consular corps it should in time tell whither we should send our surplus, and thus perform a duty which would confer on agriculture what the Treasury Departments, by means of its Consular agents, is enabled to do for commerce. The cost of organizing thoroughly the system would be a mere nothing. The cost of telegraphing the results would be very trifling, and the benefit would be that millions of farmers, who are the backbone of the nation, would have accurate information on which to act early in the season before the canals are closed by weather in some regions; and in all, before storage and interest ate up their profits.

Humboldt County Mining Matters.

EDITORS PRESS:—Not having seen any notice of this district for some time in your valuable paper, I thought it might be well to send you a few items in regard to it.

At Galena

The White mine, owned by John O. Earl, of San Francisco and H. Knowles, is taking out from three to five tons of ore a day which assays from $350 to $450 per ton. The mine employs a force of eight men. In the Original Battle Mountain claim, owned by Hon. R. McBeth & Co., they are in with their tunnel about 350 feet and have every prospect of success. They are running night and day and expect to tap their ledge in about 200 feet more.

The Butte property having fallen into the hands of Thompson, one of the original locators, will be started up in March or April and will no doubt prove one of the best mines in this portion of the State.

The English Copper Company are taking out from five to seven tons of high grade copper ore a day. Their mine improves every day, both in quality and in quantity. At the

East End of the District

The Little Giant is situated, owned by Gashwiler and others. Cross & Co. are the agents. The mine is being vigorously worked by them under the management of S. T. Heintzelman, and will at no distant day prove a most valuable property. There are also a number of other ledges: the Yuha, Mary, Alaska, and Montrose lying idle for the winter, but will no doubt resume work in the spring.

There are some very fine deposits of copper in this portion of the district which would yield a good return for a small investment, but men with capital always like to go as far from home as they can; still it will not be long before they seek for mines like ours, and I predict that in less than one year we will have one of the most flourishing camps in this portion of the State.

T. F. H.

Battle Mt., Feb. 6, 1872.

The Ramie Interests.

Perhaps not one-third of all the persons who attended the late State Fair had their attention directed to the few small specimens of ramie cloth that were unpretentiously on exhibition, and of all the number who examined it but a small proportion understood its real value and its significance among the future products of the State. As specimens of strong and elegant fabrics they are not excelled by any cloth except that made of silk, and but little inferior to silk in beauty. There is an interest excited in the production of a plant that produces such material, and this interest must increase, since the few experiments that have been tried demonstrate that the climate and soil of California will produce the ramie in perfection. The cloth on exhibition at the State Fair consisted of many patterns for dress goods, some made of ramie entire and others mixed, some with silk and some with cotton. There is no article superior to ramie for productions of cheap and at the same time elegant and durable dress goods, and if the cultivation of it on a large scale shall realize the expectation that the experiments so far create, the time is not far distant when ramie cloth should be as common as cotton. At the Fair there was a small quantity of the fibre in a coarse state on exhibition. Its great strength is remarkable, which it does not lose when prepared for the finest fabrics. Dress goods as fine and glossy as silk can scarcely be torn at all by the ordinary effort. There is much inquiry relative to the plant among farmers, and we understand there is a ramie company in San Francisco that disseminates information in regard to the culture of the plant and how the cuttings can be obtained. Farmers must not become excited on the subject of ramie cultivation. It is possible that it may prove not so profitable as anticipated. Labor may be too dear, and unexpected difficulties present themselves in separating and preparing the fibre. But it has qualities that commend themselves, and all difficulties must in time be overcome and the article utilized. That it promises to become an important production of the State is hardly to be doubted.—*Sac. Union.*

Practical Science in New York.

BY OUR NEW YORK EDITOR.

Four years ago last summer, the New York Society of Practical Engineering was organized, and at every annual session has taken hold of and thoroughly discussed some of the most important developments of the period. At the first meeting the present writer, Prof. Henry Wirtz, well known as the inventor of "sodium amalgam" and the discoverer, by synthesis, of several organic compounds, read an elaborate paper on

Natural Gas Fountains.

It appears that in the State of New York alone there are three great belts of gas-bearing formations, each two hundred miles long, an average of ten broad and having a thickness estimated at one hundred feet. This would support three thousand wells, yielding gas equal in heating power to fourteen tons of anthracite daily, for one hundred years. Similar formations are found in Canada, Ohio and Pennsylvania, but perhaps the most important is the immense area of the Devonian and Silurian basins of the Great Lakes and the Mississippi Valley, where there are five, perhaps six, great beds of such rock.

Some of the gas wells give a most enormous quantity of gas. One on the Little Kanawha, nine hundred feet deep and four-inch bore, has a two-inch pipe leading from it a distance of a mile, where it feeds the furnaces of twenty-eight steam boilers of twelve-horse power each, besides fifty stores and a large number of jets for illumination. There is one in Ontario county, N. Y., 500 feet deep and five-inch bore, which gave a flame thirty feet high, the flow of gas being about five cubic feet per second, or upwards of 430,000 per day. The gas is nearly equal to six-candle power. At Venango, Pa., gas rises from wells under a pressure of two hundred pounds to the square inch, and instead of being burned under a boiler is run direct into engine cylinders in lieu of steam. At Erie, Pa., wells can be sunk for $1,500 which will give gas enough, burned in the furnace of a steam generator, to produce 200 horse power.

Rock-Drilling Machinery.

At the same meeting Mr. Robert Meir, C. E., gave an elaborate account of the most approved drilling-machinery. Among those, Leschnt's famous diamond drill seems to hold pre-eminence. Leschnt was, it seems, not only the first to apply diamond-cutting to rock, but also the first to make a drill, cutting around a core to be afterwards broken out. One of the very first applications of the drill direct to the piston rod was in 1849, and now it is considered the simplest and best for drilling mechaniem. For American use small machines, capable of being easily handled and not likely to get out of repair, are most needed.

Imperfections in these respects unfit Sommeiller's apparatus, used in the Mt. Cenis Tunnel, for adoption here. These last were, as is well known, small percussive drills, operated by compressed air in their engine cylinders in lieu of steam. A good light apparatus has been in use for some years in the Resseberg mines in Sweden. The drill is fed by hand by a screw, and makes from 200 to 350 blows per minute, according to the hardness of the rock. The drill, and of course the piston to which it is attached, revolve once to every twenty-two strokes. American pneumatic drilling machines, of which there are several varieties, are in no wise inferior to those in use abroad, but there is yet ample room for inventors to devise better ones.

The writer also spoke at some length of the deep borings made for water in various parts of the world. We quote a few items that seem of interest. "Our government," says Mr. Meir, "has made several attempts to get water in the vast plain of Llano Estacado, near the border of Texas and New Mexico, and not far from the Messilla Valley. In 1855, a party was sent out under Captain Pope for the purpose of boring for water in this region. They commenced operation about 20 miles from the Pecos River, sinking a well 360 feet deep, when water was struck, rising in the tube 70 feet. On continuing their operations to a depth of 641 feet, water was again met with, rising 400 feet.

Not many miles from this spot they bored another well, when the same veins were struck as in the first well—finding water at 860 feet, which rose 750 in the tubing."

And again:—"The natives in some parts of the Great Desert of Sahara bored wells with success to a depth of over 1,000 feet. An increase of the temperature of the water in these deep wells has become an established fact; in some cases the increase has been 1° in every 58¾ feet of depth.

Pneumatic Power for Street Cars.

At the latest meeting of the Society, President James A Whitney read a paper on the application of pneumatic power in the propulsion of street cars. Prof. Whitney spoke with especial reference to the transit necessities of New York, but his remarks apply to other cities as well. For surface roads the only practically feasible plan of pneumatic propulsion is that in which the cars carry tanks of compressed air to actuate the engines. The great obstacle to success in this system has been the freezing of moisture contained in the air, as the latter expanded in the cylinders. To compensate for the heat rendered latent by the expansion of the air, it has been suggested to pass the compressed air pipe through the furnace or car stove, between the tank and the cylinders. A better mode would be to provide the cylinders with jackets communicating direct with the interior of the furnace. This arrangement would be needed only in winter. In summer the cooled air from the cylinders should be thrown into the car to cool the atmosphere therein. A regulator should always be used to enlarge the area of the cylinder inlet ports inversely to the pressure of air in the tanks in order to secure uniformity in the power of the pistons. Mr. Whitney also made reference to the several modes of employing pneumatic power to the propulsion of elevated and underground railways. After the reading of the paper a lively but pleasant discussion sprang up, concerning various plans advocated by members. One of the most noticeable of the items elicited, was from the venerable Peter Cooper, who took a warm interest in the proceedings. In the use of spiral fans for producing an air blast, he stated that in the locomotive made by him in 1829, the first ever constructed in an American workshop, the draft in the smoke stack was produced by a screw or wheel with spiral vanes rotated by a strap from a pulley on the driving axle. It drew the shavings right through from the fire-box to the top of the chimney. Another curious thing in this engine was that the tubes in the boiler were made of gun barrels. At a late hour the meeting adjourned for one month.

OUR CHIEF CITIES.—The cities which have ascended the scale in population, proportionately over their neighbors, within ten years, are St. Louis, Chicago, San Francisco, Washington, Cleveland and Jersey City. Those which have fallen below their classification of ten years ago, are, Baltimore, Boston, Cincinnati, New Orleans, Buffalo, Newark, Louisville, Detroit and Milwaukee. New York, Philadelphia, Brooklyn and Pittsburgh maintain the same relative rank they did in 1860.

Mechanical Progress.

Asbestos for Piston Packing.

We condense the following from the *Engineer*:—Few engineers who have to do with the steam engine are ignorant of the tronhle which is met with in ohtaining a really good piston-rod packing. Sound hemp, properly "laid up," and copiously lubricated, makes a tight joint for a time; hnt the period of tightness is usnally short, and mnch friction results, which is very prejudicial in small engines. If hemp is bad in the caso of low-pressure engines, it is infinitely worso with high steam. A slow process of carbonization appears to go on, tho hemp packing loses its elasticity, and hecomos nearly useless for its intended purposo. All mannor of schomes have beeu tried to get over the diffienlty, comhinations of cotton, indiarnhber, and wire gauze. In tho latter easo the tightnoss of the joint is no doubt secured hy the prosenco of water and oil lodged in the meshes of the ganzo. [No mention is made by the *Engineer* of auy motallic packiug othor than this "wire gauze."] It is still certain that somothing hetter than anything hitherto in uso is reqnired, and wo have a stroug helief that this somethiug may bo supplied hy asbestos.

Asbestos is a mineral fibre, greasy to the touch, and very strong, which can bo easily spnn or woven if proper precantions are nsed. Furthermore, it is an admirahle non-conductor of caloric, and is practically indestrnctible hy heat. All these couditions are just those which are required in a material for piston packing; and it is therefore somewhat strango that nntil a very recent period no one thought of utilizing ashostos for this purpose. This packing was first used in America with much success, and it has sinco heen tosted in England with excellent results.

The inventor, Mr. J. V. Day, on the 5th of September last read a paper hefore the Engineers' Institute of Scotland, from which it appears that no matter how high the temperatnre of the steam, how rapid the stroke of tho piston, or how grest the pressure of the steam, the packing seems to he unaffected by these conditions. Where the new packing was first used, some of it was taken from the piston-rod stuffing box of a locomotive engine, after having heen in, and the engines at constant work, for three months, with steam at 130 lb. pressure, and making an average daily run of 100 miles, including Sundays; and the fihre, (a sample of which wss shown), with the exception of being discolored by oil and iron, was just ss flexible and tenacions as origiually. After having been once disintegrated, it appears impossiblo to so pack or mst the fibres together that they are not easily sepsrated by the fingers.

Asbestos packing was first used in Great Britain by Mr. Benjamin Conner, locomotive superintendent of the Caledonian Railway, and Mr. Day exhibited to the members of the Institute the packing of a locomotive stuffing hox which had been nsed on that line from the 27th of July, 1871, to the 18th of November, where the ordinary packing lasts, on their locomotives, two months, at most, rarely so long, and the gland requires constant screwing np. The asbestos packing was apparently as good as when put in, and the engine had run a distance of 14,070 miles; during three weeks of which timo, although the engine hsd run 2,000 miles, the gland screws had never been touched.

In the course of the discnssion Mr. Connor stated that he hsd applied it coiled round the piston rod continuonsly; but he thought it shonld he applied in rings. The inside of tho packing seemed to him as fresh as when first put in. He believed it took less oil to lubricate the piston-rod, for the oil remained on the rod, not heing absorbed by the packing. It kept the rod beautifully polished, more so than by any other packing.

Cheap City Transit.

There is at this time no more important qnestion demanding a solution from our inventors and mechanics, than that of cheap transit for the clerk, artisan and merchant from the shop or place of business to the dwelling, which points, in a large city, must of necessity he quite widely sepsrated.

To this must also be added the better housing of the working classes, now imperatively urged as a necessary means of national progress. It has been proved that the largest source of profit to transit companies is "third class"—in other words, tho great masses of working humauity. The humanizing influonce of gardons may bo accessible to some of the families of working men, as distance vanishes by mechanical fscilities. If commercial stimnlns induces progress in this direction, it will be a great advance on the morsls, prosperity, and happiness of our grest commercial and mannfacturing oities; hnt till wo can get mechanical powor subshtnted for horso flesh as the means of transit, we shall ho as far behind in tho rosults as are omnibnses and stage coaches compared with railways, at a given cost, doing only one-eighth of the work.

Next to choapness is tho necessity for increased speod. The averago speed of the horso car is ahont four miles per hour, snd that is accomplished only with serious distress and wear to horso flesh. What wo need in this direction is the power to increase or diminish our speed at pleasure, according to safety. Wo cannot do this till we are ablo to resort to the power of steam or elastic gases. One great reason why we havo not done this is hecause we have not yet produced an engine comhining simplicity and efficiency with tortuitous transit. Our ordinary railway engiuos can only run on largo curves, snd then at a great cost and waste of powor. They cannot run at all, practically, on such short curves as are required for the ordinary purposos of street railroads. The control of tho steam blast and smoke is another matter which has not yet reached a satisfactory couclusion. The discharge of steam must he so controlled as to he comparatively noisless, while the consumption of fuel must be so perfect that nothing hut the absolutely invisihle products of combustion are thrown off.

Revolution in the Method of Grinding Substances.

The principal applied in grinding substances has thus far heen always a crushing betweeu two hard surfaces oombined with a motion of one or hoth, as in treating cereals, paints, drugs, and in general most things which we wish to suhdivide finely.

It has been reserved for our time, says the *Manufacturer and Builder*, to make a new application of a well known mechanical principle in order to accomplish grinding or pulverizing by the effects of high velocities, from which some startling results obtained by bodies moving with great rapidity have been known for a long time; such, for instsnce, as firing a candlo from a musket through a wooden board; cutting, by means of a rspidly-rotating disk of paper, suhstances much harder than paper itself; incising figures on glass by rapidly-rotating disks of metal etc., in all of whioh cases the velocity of the candle or paper compensated for its softness, and the velocity of the motion of the molecules, constituting the soft substance, produced nnexpected results.

This same principle of high velocities is now being applied to *grinding*—a very different and more useful operation, and, in fact, one without which man can scarcely exist. The barharian grinds, or rather crushes his corn by meaus of a bowl and rolling stone, or a mortar and pestal; while civilized man thus far has crnshed his cereals between rotating stones. This is altogether to be reformed.

The New York Attrition Pulverizing Company make machines after Ryerson's patent, obtained two years ago, in which high velocity obtained by centrifugal power accomplishes the object without crushing. Tho difference in the power required for grinding by the old and new systems is most striking. For grinding 3 tons of marble or plaster to a powder, the power required to drive common Ryerson stones is from 2 to 3-horse power, while in this machine a single horse-power is sufficient to accomplish this, while it is also able to impalpahly pulverize quartz as well.

[The principle of the Ryerson machine has been tried in this State for reducing quartz, with unsatisfactory results. It is possiblo, however, that his more recent patent may comprise improvements which have rendered the principle a practical one.—Ed. Press.]

Measuring the Speed of Ships.—The reel hitherto used to measure the speed of ships is another time-honored institution that is passing away. The rhysimeter is an instrument which permanently connects the water with an indicator in the captain's room, marking the exact speed at all times.

Scientific Progress.

Current Scientific Progress.

Scientifio investigation wss never making moro active or earnest progress than at the present time; and in no depsrtment of research is this progross moro manifest than in that of

Chemistry,

In which soveral new suhstances have heen hronght to light within the past three or four months. Among them are mentioned *regianine*, discovered in the walnut; *acridine*, s new substance derived from anthracito; *carnine*, found in flesh, etc. Within the period mentioned, Solet has also announced the discovery of two distinct spectra in the flame of sulphur. In

Astronomy

The principal interest has centered in tho observations connected with the return of Encke's and Tuttle's comets. Some most interesting spectroscopic observstions on the light of these hodies have already heen announced, snd others may ho expected. Tho eclipse of the sun in December last has also furnished an important field of research. Two new asteroids hsve also been announced, making the numher of tho series, so fsr as now known, 117. In

Meteorology

Constant and satisfactory progress is heing msde. The establishment of the Signal Service of the United Ststes is sn important movement, and gives promise of much practical as well as scientifio utility. A paper has heen published by Strentz which shows as to the result of a careful comparison and study of numerous observations, that the moon does not exercise any appreciable influence upon the westher, contrsry to the common idea, and the opinion of some eminent writers. In

Tsrrestial Physics,

We have some interesting reports of experiments in India with the pendulum for the determination of the mass of mountains, from which it would appesr that the density of the earth, at the surface decreases ss we proceed from the sea coast to higher elevations and mountain ranges. These observations and conclusions are highly interesting. Prepsrations are also heing made for a series of pendulum and thermometic observations at the Mount Cenis tunnel, from which interesting results are expected.

Geography

Has been essentially advsnced, by the pubhcation of various memoirs and reports of expeditions, among which may be psrticularly mentioned the trip of the Ice Bear, which left a nothern port of Europe only in May lsst, and returned in October, having penetrated to 79° north on the 43d parallel of East longitude. An open polar ssa was easily reached. The departments of engineering, mechsnics, technology, zoölogy, and physiology, have also received many valuahle contributions.

Flowers as Disinfectants.—Professor Mantegazza has recently discovered that ozone is developed by certain odorous flowers. A writer in "*Nature*" states that most of the strong smelling vegotahle essences, such as mint, cloves, lavender, lemon, and cherry laurel, develop a very large quantity of ozone when in contact with atmospheric oxygen in light. Flowers destitute of perfume do not develop it, and generally the amount of ozone seems to be in proportion to the strength of the perfume emanated. Professor Mantegazza recommends that in marshy districts and in places infested with noxious exhalations, strong-smelling flowers should bo planted around the house, in order that the ozone emitted from them may exert its powerful oxidizing influence. So pleasant a plan for making a malarious district salubrious only requires to he known to he put in practice.

Curious Fact (?) —At a recent sitting of the Fronch Academy of Sciences, a curious communication was received from M. Zaliwski, which, if it were borne out, would he invaluable to navigation. He states that if a hollow cylinder made of thin materials, open at the top and provided with a sharp-edged bottom, be properly ballasted and then put into a tub or other vessel filled with water, it will soon move in a never-varying direction from west to east. The round tin boxes in which concentrated milk is preserved will do perfectly for the experiment, which will become more and more perceptible the oftener the same cylinder is made to do duty in that way.—*Engineer*.

The Origin of the Heat of Fire.

The origin of the heat doveloped dnring comhustion has hitherto heen a profound mystery. In the beginning of this century it was suggested that a portion of the spocific or of the latent heat of the bodies consnmed was set free dnring the process of combustion; but this ides was soon overthrown, as it was found that tho products of combustion often possess more specifio heat, and almost always more latent heat, thsn the hodies themselves did hefore *burning*—that is, before chemically combining under evolntion of heat.

To illustrate:—the specific heat of oxygen is 0.21, and of hydrogen, 3.4; if, now, 8 lhs. of oxygen comhine with 1 lb. hydrogen, forming 9 lhs. of water, the specifio heat of the mixture must he $8 \times 0.21 + 1 \times 3.4$, or 5.08; this, divided hy 9, to find the heat per 1 lh., gives 0.56. Now, the prodnct of this comhnstion, which is water, hss a specific heat of 1, nearly twice ss great; but, hefore becoming water, it was first stesm, of which the specific heat is only 0.48, hut which, by its condensstion, gives off not less than 966 units of latent heat. Hence arises the question:—Whence comes all this intense heat of combustion, and the subsequent great smount of lstent heat, when the resultant substance in the end posesses more specific heat thsn its elements before comhining?

It is curious to remark that some eminent physicians hsve concluded that combustion must he "an electric phenomenon," hut that scientists, who have studied its laws, should use this pretext for explaining firo, solar heat, volcanoes, and even earthquskes, seems almost incredible.

Notwithstanding the laws of heat and of electricity have heen thoroughly investigated, we are not ss yet sure of their ultimate nature; one thing only appears certsin, namely, that neither is a fluid, penetrating matter, but thst both are mere motions of the molecules or atoms of matter. Beyond that all is mere conjecture.

What is Going on in the Sun.—Recent investigations of the sun and other hesvenly bodies, by means of the spectroscope, have revealed the fact that all matter may he in a more than gaseous condition—incandescent gas of so high a temperature that the elements are dissociated; thst is, that all chemicsl affinities are destroyed, snd esch element exists separately in its uncombined condition, notwithstanding it is intermingled with the others. A descent from this exceedingly high temperature to that in whioh the chemical affinities can manifest themselves results in the comhination of the gases.

The chemical affinities of the different elementsry suhstsnces thus manifest themselves only between a comparatively limited range of temperature, below and ahove which they do not operate. Even as at an extreme cold no combinations csn take plsce, so at the extreme heat of say 8000° Fahrenheit, not only no combinations take place, but all componnds are separated into their ultimate elements. On cooling and reaohing 4000° or 3000°, or thereahout, the volatilized substances, or gases, will again combine, the chemical affinities come into play, and combustion will ensue, the heat of which will sgsin originate partial new dissociations. This is what continually appears to take place in the sun.

Agricultural Chemistry.—It is a well-established fact that the quantity of nitrogen contained in cereal crops frequently very far surpasses the amount contained in the manured earth from which they are grown; and the manner in which the additional nitrogen has been acquired is one of the many puzzles of agricultural chemistry. That it is derived from the air, there is no question, but in what manner? Has it been absorbed by the plants directly from the air, or has it heen first withdrawn from the atmosphere by some of the constituents of the soil, with which it could form compounds which were capahle of vegetable assimilation? M. Deherian seems to have succeeded in demonstrating what was never before suspected, *that in the presence of organic matter oxygen combines directly with nitrogen*, forming a compound analogous to the ulmic or humic acid, produced by neutralization by an acid of the potassic solution of garden mould. Into a perfectly dry tube he introduced oxygen, nitrogen, ammonia and glucose, and on heating the mixtnre finds that a black nitrogenons matter is formed, while at the same time a portion of the nitrogen disappears from the atmosphere of the tube.—*Les Mondes*.

Mining Summary.

The following information is condensed mostly from journals published in the interior, in close proximity to the mines mentioned.

California.

ALPINE COUNTY.

Monitor Mill.—Monitor *Miner*, Feb. 3: After some vexatious delays this mill is now at its regular work. The ore coming out of the mine is improving rapidly in both quality and quantity.

Monitor No. 3 mine is rapidly improving, now that the completion of the ore house and chute allows of putting on men for ths purpose of taking out ore. The breasts at several points are in good ore of good quality. Some pockets of ssck ore taken out this week were nearly half pure black sulphurets; some peculiar veins of ore found in a lower level have astonished those best posted on this mine.

CALAVERAS COUNTY.

San Bruno Mine.—Calaveras *Chronicle*, Feh. 10: The tunnel is hut a few hundred yards from the Vance mill, and is easy of access. It is 4 hy 6 ft. and has been run into the hill 600 ft. and through quartz 350 ft. From the mouth of the tunnel 250 ft. is the first chimney. The second is 275 ft. and the third 370 ft. The third chimney is but 120 ft. to broken ground, where a shaft had previously been sunk. In sight is rock sufficient to satisfy reasonahle men. The Co. are running a second tunnel 220 ft. below the first. It is in ahout 115 ft. and gold bearing quartz has again been struck. This morning I saw the returns from 4 tons crushing—$542,77. This was from the Grasshopper, at Mosquito. The Good Hope, on the same lead as the San Bruno, is hauling quartz to Clark's mill at Rail Road Flat.

Gwin Mine.—All the stamps in the mills at the lower Gwin mine are crushing a fair quality of ore. In the upper mine the 400 ft. level is heing re-timhered. As soon as that is completed the shaft will he cleaned out and active operations resumed. It is the intention of the prop. to sink a mammoth shaft in the centre of the mine during the coming summer. Additional stamps will also he put up as soon as the weather and roads will permit.

Good Hope.—First-rate rock continues to be taken out of the Good Hope mines at Mosquito Gulch. The lead averages ahout 3 ft. in thickness and all the rock contains gold.

The Calaveras Hydraulic M. Co. are pushing forward matters at Central Hill rapidly. Five tons of pipe iron are on the way up from San Francisco. Everything is heing got in readinsss to commence operations upon an extensive scale.

EL DORADO COUNTY.

Immense Ledge. — Auburn *Stars and Stripes*, Feb. 8: The other day we were shown a number of handsome specimens of quartz from the Ella ledge, Greenward dist. These were heavily loaded with galena and black sulphurets. The ledge from which they were taken is full 6 ft. in thickness, and can be traced on top of the grouud for a distauce of 3,000 ft. so located that a tunnel can be run on the ledge at a depth of hundrsds of ft. helow the surface from which these specimens were taken.

INYO COUNTY.

Hot Springs.—Inyo *Independent*, Feb. 3d: Hot Springs is likely to have another 10-stamp mill in the spring.

NEVADA COUNTY.

Started Up.—Grass Valley *Republican*, Feb. 10: The Dartmouth mill commenced crushing gravel cement on Wednesday for the first time. The mill has 8 stamps, but only 4 are used at present on account of lack of power. The Dartmouth has its main tunnel in ahout 600 ft., and the gravel prospects well.

Quaker Hill.—Jacobs & Sargent are running 5 sets of claims, use 2,000 inches of water, and employ 45 men.

You Bet.—The English Co. cleaned up one set of their claims this week, after a run of 29 days, and realized $6,000.

Slide.—A heavy slide occurred in the claims of Ashhurne & Baker, at Scotch Flat, on Friday. The slide or cave was a strip of ground about 100 ft. in length by 60 in width. The meu engaged in handling the nozzle escaped without injury. The monitor was covered hy the slide, but was lot otherwise damaged. In 3 or 4 days the Co. will have the slide pretty well sluiced out.

The pump shaft at the North Star mine broke yesterday forenoon. An old shaft was procured at the Rocky Bar mine, so that the accident will cause but a short delay.

Ben Franklin Mine.—Grass Valley *Union*, Feb. 11: We noticed yesterday, at Findley & Co's. bank a quantity of gold dust valued at $2,300, from less than 50 tons of rock.

North Star.—Yesterday the North Star shipped to S. F. gold to the value of $15,-300. This is the second shipmeut for a month's run of the mine and mill. The total gold product, for 4 weeks, of the North Star is about $22,500, and of that amount the profits amount to ahout $13,-000.

Good Clean Up.—Roberts & Colley, in their claim at Rough and Ready, cleaned up on Saturday, after 6 days washing with 2 hands at work, between $600 and $700, or over $50 a day to the hand.

San Juan.—Nevada *Transcript*, Feb. 6: The American Gravel M. Co., is working 50 or 60 men and is, paying well.

On the San Juan Hill 3 Cos. are at work. Dunniker & Co., who had their new flume injured by the storm, were dslayed for a time, but they have everything ready for washing.

Davis, Bower & Co. are running about 500 inches of water and are employing 8 or 9 hands. The claims are doing well.

New Tunnel.—N. C. Miller & Co. have commenced a hedrock tunnel, to run from Sweetland Creek, to open the Manzanita claims in the hill near the town of Sweetland, Bridgeport township.

Relief Hill.—The Co. at Relief Hill are actively preparing for work. The Eagle Co., whose mine lilled with water, have their drifts all cleared and are about ready to commence taking out gravel. Other Cos. will soon start up.

Being Crushed.—National *Gazette*, Feb. 3d: Wyoming mine, on the north side of Deer creek, is having about 200 tons of good rock crushed at the Bunker Hill mill.

Providence Mine.—Work on the Providence mine, is being vigorously prosecuted. An incline shaft is being sunk on the ledge, and hoisting works are being erected.

PLACER COUNTY.

Mining Enterprise.—Auburn *Stars and Stripes*, Feb. 8th: Damsguard & Fields, of Alta, and J. Fewings, are making preparations for hydraulic operations on a large scale on a portion of the Fewings ranch, a short distance below this town. Their mining ground comprises ahout 60 acres, all of which is believed to be rich.

Rising Sun.—Grass Valley *Republican*, Feb. 8th: The rising Sun at Colfax is paying its owners good returns. The rock they are crushing averages between $40 and $50 a ton. They are down on their third level 300 ft. from the surfacs, and have a ledge of from 18 to 20 inchss wide. Preparations are being made to sink for the fourth level, which will be about 80 ft. below the third level. The Co. have had about all the water in the mine their pumps could hoist since the heavy storms commenced. Thirty men are employed in the mine and mill. The sulphurets from the Rising Sun are unusually rich, frequently yielding over $300 a ton.

SIERRA COUNTY.

Good Hope.—Downieville *Messenger*, Feb. 3d: The boys are getting out rock in this ledge, which is being crushed by E. Leonard's mill. The mine is promising well for its owners.

Brandy City.—Cor. same: Every Co. on the hill is working full handed. The Arnott will have the best season run. The Hicky is prospering. The Sharp Co., at Grizzly Hill, are working full handed. There has heen a small hreak in their ditch, but it must have heen repaired ere this. There was another in the Hosie's flume, helonging to the Hickey Co., but all damages are repaired.

TRINITY COUNTY.

Not Bad.—Weaverville *Journal*, Feb. 2: Hass & Co., of Junction City, are running 2 pipes and clean up every 2 weeks. So far their claim has paid them $100 per day.

Douglas City.—Cor. same: From all parts comes the information that this is going to be the best mining season we have had for many a year; every miner is busy, but as yet few have made any cleaning up. I hear of one Co. only and that paid a fraction over $10 per day to the hand.

The boys on Dutton creek are running off a tremendous amount of gravel, and toward the latter part of this week will make the first clean-up.

The Douglas City miners will all be running water in a few days; some are at work already. Tourot is running 2 pipes on his Douglas City claim and is getting dirt off fast.

The sale of the Sillcox mine on Indian creek has enlivened the quartz question considerably.

Hay Fork.—The miners are all at work and have better prospects than for several ycars. On the East fork, Sims & Co. are highly elated at their show. Billy Ruch and partner started in last week, struck the old streak and cleaned up 5 ounces the first week. This week they picked up a $29 *chispa*. Stevenson is working 4 hands besides himself. Squire Wells & Parlin are sluicing and doing well and Dennis Rourke & Conlin are making it pay; also the Sullivan boys.

In the Valley, Duncan's, J. S. Hoyt's and Jake Hilliard's claims are all running with plenty of water.

Nevada.

EUREKA DISTRICT.

Bullion.—Eureka *Sentinel*, Feb. 6: Paxton & Co. shipped, yesterday for the Pinto M. Co. to London, 4 bars, 179 lbs, valued at $3,254 48. The first shipment of hullion from the Pinto mill was made on the 2d. The amount was 13 tons, 520 lbs. valued at $9,455.68.

Rich.—We were shown an assay to-day of a piece of ore from Secret Canon, the result of which was $2,350. The owner avers that he has 40 tons of the same sort of rock on the dump.

Looking Well.—The Wide West mine is looking well, and a very fine body of ore is being disclosed.

McGarry.—We have been shown specimens of ore from the McGarry dist; it looks well for surface rock. They were from the Carahantes and Mexican Mines. The croppings on the Mexican location can be traced 60 ft.

Lemon Mill.—The mill will start up on the 9th and make a trial run.

Mill Site.—The Adams Hill M. Co. (formerly the Wide West Co.) have purchased a millsite near the Lemon Co.'s property. The work of building a 20-stamp mill will be soon commenced.

ELY DISTRICT.

Bullion.—Ely *Record*, Feb. 4: W. F. & Co. shipped since Jan. 18th bullion valued at $25,269.66.

Chapman Mine.—A whim of the Marshall patsnt has heen placed on ths mine. With this the Co. can sink to the depth of 400 ft. without other machinery. The shaft is being newly timbered throughout. It is 200 ft. deep, with a drift 24 ft. from the shaft to the eastward. Ths body of ore at the bottom of the shaft is large and well delined, and the general belief of mining men is that this is the Raymond and Ely Ledge, which runs east from Panaca Flat. The Supt. informs us that he will commence hoisting ore at once.

Raymond and Ely Co.'s Mills.—On the 4th of Feb. the new 30-stamp mill of the above Co., together with the old 20-stamp mill, started working, making 50 stamps put in operation that day.

Havana Mine.—This claim has been purchased, and work commenced at the bottom of the old shaft to develop the ledge. This claim is ahout 400 ft. southeast from the shaft of the American Flag.

Alps.—On the 26th inst. J. James, Supt. of the Co., shipped $5,026.89 in bullion, over .900 fine, the proceeds of 25 tons of ore worked at the Chicago Mill. The shaft is down 146 ft. and shows the body of ore at that point to be equal to that found in any other portion of the mine.

Newton Booth.—In running the drift south from the main shaft at the 180-ft. level a fine looking ledge has been cut, at a point 37 ft. south of the bottom of the shaft. At present the ledge is four ft. wide, and no evidence of wall rock has yet been found.

Pioche.—This claim still works, sinking the main shaft and preparing for work, when future developments shall expose a ledge of pay ore, which we think will be found within 100 ft. of the present workings of the company.

HUMBOLDT.

Bullion.—Unionville *Silver State*, Feb. 10: Amount shipped from the Arizona mine, since our last issue, was $8,000.

From the Old Sheha mine we have superlatively good accounts.

Inskeep, Henning and Eolipse Mines—Operations on all these mines continue. The Inskeep is looking well, and yields its accustomed amount of shipping ore. The Henning tunnel is in nearly 300 ft., still goes ahead on the vein, which varics from 1¼ to 5 ft. in thickness. The run of ore will average about $70 per ton.

REESE RIVER.

Belmont Bullion.—Reese River *Reveille* Feb. 3: We saw at W. F. & Co.'s office this morning awaiting shipment 5 bars weighing 5,484 oz. and valued at $2,453.21, the product of the El Dorado South at Belmont.

Bullion.—A. Paxton & Co., shipped during Jan. 38 bars valued at $27,113.17, of which 14 bars, valued at $15,925.31. were from the Metacom Mill, from ore from the Pacific M. Co.'s mines, and 24 bars valued at $11,187.86, from the Stetefeldt Mill, at Belmont, from ore from the El Dorado South.

Arizona Mine.—The ore channel improves every day under the work beiug prosecuted upon it. The shaft sunk on the second level is down 160 ft. at which point the lode shows a thickness of 5¼ ft. 3¼ of which consists of good milling ore and a considerable proportion of it of high grade shipping ore. A drift runs north from this shaft, at a point 120 ft. down, discloses a ledge 5½ ft. thick—4 of which is ore equal to anything ever found in the mine. Four other shafts carried down at various points north of the southerly end of the second level reveal at each a ledge equal in all respects to that brought out in the 160 ft. shaft.

Humboldt City.—Work has been started up on the Starlight lode. The Supt. has put on 2 shifts of miners.

Central Dist.—This dist. lies in the mountain range about 8 miles north of the C. P. Railroad. The ledges, though of moderate size, are compact and shapely, and carry ore generally from the surface. The ores are composed largely of chlorides and sulphurets with some galena, snd are mostly of high grade; the ledges being opened affording enough from the shafts and other exploratory works being driven to defray current expenses. There is a prospect of a 15-stamp mill being erected on the river near the mines next spring. There are now about 20 miners in the district.

De Soto Mine.—Work is heing pushed on this mine, adjoining the Sheba, in Star District with most satisfactory results.

Peru.—The lode shows a thickness of from 4 to 5 ft. It carries a large proportion of ore, which with a little assorting will mill from $100 to $150 per ton.

WASHOE.

Bullion.—Virginia *Enterprise*, Feb. 7: We yesterday noticed upon the counter of the Bank of Cal. 9 bars of Belcher and Crown Point bullion worth $31,500. Some of the Bslcher bars were over 60 fine in gold.

More Ore Found in the Savage.—A deposit of ore has been found on the fourth level of the Savage, 700 ft. below the surface. This new development is about 200 ft. south of the Gould and Curry line and is 2 or 3 ft. wide, of very good ore.

Ophir.—The rock is favorable and good progress is being made in ruuning the drift on the 1,100 ft. lsvel.

Sutro Tunnel.—The Sutro Tunnel was yesterday in 2,713 ft. They are in hard porphyry rock, and are making slow progress. Shaft No. 1 down 90 ft. The rock is trachyte, and works well. No. 2 is down 123 ft., the rock works well—some water coming in. No. 3 is down 83 ft. in ground that works well. They are timhering this shsft. No. 4 is down 78 ft. and is in hard ground. They are hoisting from this shsft about 1,200 gallons of water per 24 hours.

Sierra Nevada.—That the new strike is upon the vein from which came the rich dirt and float rock worked lower down the hill in 1862, we have but little douht. This new back ledge contains ore which presents precisely the same characteristics as the float rock found in early days, and the assays are better than any before ohtained in any deposit found in the hill, beiug from $45 to $150 per ton—$20 to $29 of which is silver. That they have a "big thing" if they have found the ledge from which came the rich dirt and rock worked 10 years ago, may be seen from the following items in regard to what was done in 1862 by the old Cedar Hill Float Rock and Surface M. Co. Thc Co. had a small stream of water and worked into the hill by the hydraulic process, saving all the rock they forked out of their sluices to be crushed at the mills—to which they sold it at $25 per ton. June 13, 1862, Mr. Clemens, one of them took $211.31 in sluicing 45 hours. June 21, they cleaned up 10 lbs. of amalgam worth $14 per ounce. For the 10 weeks previous to August 9, they took out 700 tons of rock which they sold at $25 per ton, and during that time the free gold paid regularly $1,000 to $1,500 per 10 days run—the last run of the 10 weeks paid $1,300. August 2, they found a chunk of gold quartz for which they refused $300.

Items.—The 1,200-ft. level of the Crown Point mine is looking and promising still better than ever. The cross-cut has reached the east wall and develops the ore deposit to he 118 ft. wide, with the richest ore lying next to the east wall. The annual report of the Belcher to Jan. 1 shows a production of 18,468 tons of ore,

valued at $1,199,135, or an average of $64.26 in the last 5 months, since when the new discoveries were available. The cost of production was $599,775, of which $12 per ton is for crushing and $7.50 per ton for labor. The south drift, at the 1,100-ft. level is in ore which averages about $132 per ton.

WHITE PINE.

Base Mines—Great Valley Co.—The mines owned by the Co. are at the foot of Babylon Hill, about half a mile from Swansea, near Shermantown, and consist of the Great Valley and Union mines, with a length of 2,000 ft. of ground. The location was made in April. A tunnel was started and run west 200 ft. in ore. Fifty ft. from the end of tunnel a shaft was put down and ore found. An air-shaft was sunk 125 ft. deep, to the bottom of the tunnel, and found a fine body of ore the whole distance down. Afterward a shaft 30 ft. deep was sunk on the side, and a ledge of mineral 5 ft. wide developed—making altogether a depth of 155 ft. in ore, from the top of the air shaft to the bottom of the 30-ft. shaft. Three other shafts are down on the line of the ledge, and ore found in all of them. The ledge is prospected for 1,000 ft., showing ore wherever the ledge is opened. Five hundred tons of ore were extracted from the mine; 100 tons were disposed of to the Matteson Furnace, and 400 to the other furnaces in the Dist., and turned out bullion to the satisfaction of the owners and purchasers. It is estimated that 75 tons of ore can be extracted daily from the present openings, and the number of tons increased after further openings are made.

In different openings are bunches of galena ore which assay (in silver) from $50 to $200 to the ton.

Launceston.—This mine is on the west slope of Treasurs Hill, and about ¼ of a mile from Shermantown. There ie 10 ft. of an open cut on the ledge, and a tunnel in 35 ft., making 45 ft. altogether run on the ledge. In the back end of the tunnel there is a well defined foot wall, and a good showing of ore. There are about 20 tons of ore on the dump. The length of the mine is 800 ft.

Empire.—The Empire mine is on the west slope of Treasure Hill. There is a tunnel in 100 ft., showing a large body of carbonate and milling ore. The pitch of the ore is almost vertical. Inside of the tunnel there is a lot of ore sacked up, that was taken out while running the tunnel. About a year ago a shipment of ore was made to S. F., which worked $100 to the ton.

Monile.—The Mobile is about half a mile up the cañon, above the Great Valley mine. A tunnel is run in on the ledge 200 ft., and shows a true fissure vein, with well-defined walls. In the center of the location there is a shaft 70 ft. deep, showing ore from 3 to 5 ft. in width, that assays $80 and $200 to the ton. A drift is in 80 ft. from the bottom of the shaft. There is about 450 tons of ore on the dump that was taken out of the drift. A force of men is at work prospecting and making further developments.

Bowie & Brown.—Thie location is 1,000 ft. in length, on the northweet end of Blue Hill. There is a tunnel in 100 ft., which taps the mine at 75 ft. from the surface. The ore is of a bluish green cast, of a copper character, and requires roasting. A shaft is down 45 ft. from the bottom of the tunnel showing the ore body increasing in thickness. About 50 tons of ore were breasted out and milled, going from $90 to $100 to the ton.

Reindeer.—The Reindeer is an extension of the Empire, and owned by the same Company. There is a shaft down 40 ft., showing a fine body of carbonate ore, going down vertically, as in the Empire. 45 tons of the ore taken out of the shaft was worked, and averaged $100 to the ton. Assaye of the ore go as high as $500 to the ton. The length of the mine ie 1,400 ft.

Live Yankee.—A shaft is down 65 ft., from which 67 tone of ore were taken out and sold on the dumps for $20 per ton. The ore assays $60 to $900 to the ton, and will average about $100. The character is copper, with a showing of lead. The last shift of men averaged a ton of ore to the hand in the breast. The location is 1,000 ft. in length.

Other Base Mines.—Among the most prominent base mines are the Imperial, Monitor and C. O. D. There has been a large amount of work done on the Imperial, showing an immense body of ore.

Treasure Hill Mines—North Aurora. The Risdale chamber has improved very much in appearance since our last visit. The ore ie of a higher grade and requires hut little assorting. Shipping from 30 to 35 tons daily by tramway. Rich bunches of high grade ore have come in. Hoisting night and day through the Engine shaft, and shipping 50 to 60 tons daily by tramway to mill.

East Shenoygan.—Ten men are employed in the different works. The south drift has made 6 ft. in depth since last report. Exchange incline made 3 ft.; spar in the bottom. Regent drift made 7 ft. the past week, making a total distance of 95 ft. The ore in sight is of a better quality than any ever before taken out. The ore is one foot in thickness, lying on a spar wall.

Asbury Tunnel.—Norris has resumed work in the tunnel with a force of men. He has a contract for the whole work. The tunnel is in over 300 ft. Running ahead and prospecting in the side drifts.

Eberhardt.—There is one shift at work cleaning out the snow from the Keystone tunnel. Shipping ore every alternate day by tramway to mill.

Gen. Lee.—Following spar seam up the hill from the ore chamber. There is a width of 3 ft. of ore in sight, and improving in quality as work is pushed ahead. The indications for opening up a good body of ore are flattering.

Copper Glance.—Two men employed. Drift at the bottom of shaft driven ahead 3 ft. since last mentioned. The new or north shaft is sinking in limestone; cap put down 3 ft. since last report.

San Juan del Rio.—The ore is improving in quality as depth is attained.

Beecher Cons.—There is a shift of two men working at present.

Beecher. — Sinking the winze in the Phillpotts chamber to connect with the East drift of the Lady's chamber. Running 2 shifts of 6 men.

South Aurora.—Work progresses as usual in the tunnel and shafts with encouraging prospects.

Pocotillo.—The ore is of a fair milling grade.

Outside Dists.—Grant is 65 miles south of Hamilton, and about 12 miles north of the mines of the Troy M. & M. Co. The mines are favorably situated and easy of access. Within a radius of a half mile is a group of mines that have been more or less developed. Following are the results of assaye made from a number of the mines: Chieftain lode, South of the cañon, carries 2 ft. of ore that assaye $300 to $600 to the ton. A short distance south are the White Cloud, Poorman, and Patriarch. The first named has a shaft down 6 ft., showing with well-defined footwall, 2 ft. of mineral, assaying $70 to $500 to the ton. On the Poorman there is a shaft down 60 ft., with a vein of 4 ft. in width, 2 ft. of it good milling ore, which assaye $120 to $500 to the ton. The Patriarch shows a fine body of ore on the surface that is traced out for several hundred feet. Assays go from $80 to $600 per ton. About a mile and a half southwest ie the Ramshorn, on which a shaft is down 10 ft., showing well-defined walls and a vein of mineral, going $50 to $250 per ton. The Rocket, South of Fish Springs, is also a well developed lode. The ore assaye $50 to $250 to the ton. Connel lode is north of Hunter's cañon, a short distance below the spring. This ledge promisee to be the leading mine of the Dist. The country rock is quartzite. There is a shaft down 40 ft., with 6 ft. of ore, pitching at an angle of 45 degrees. The ore assays from $90 to $300 per ton.

Idaho.

Quartz.—Silver City *Avalanche*, Feb. 3: During Jan. the quartz weighed at Garlick's scalee foote up 2,200 tons.

Local Record.—The Elmore mine still continnee rich in the 7th level which is being run north fast. The ledge looks well in the winze, which is being both sunk and raised. The only bad feature about this chimney of ore is, that it commencee about 100 ft. north of the shaft, and cannot be mined out until the 6th level drift is in far enough to sink a winze from the 6th to the 7th level, to give ventilation of air, which will occupy about 2 months. The object of sinking the winze from the 7th level is to determine whether the rich body of ore goes down. If such is found to be the case, the main shaft will then be sunk for the 8th level.

That portion of the Oro Fino mine owned and worked by the Elmore Co., is not turning out quite as much ore as it was a short time ago, neither is the ore quite so good.

The Oro Fino Discovery North, which Minear is working for the Owyhee Co. is turning out more ore daily than usual, and of a somewhat better quality.

The ore is improving in the 3d level drift north, which is being run by the North Oro Fino Co. This drift is run for the purpose of getting into the ground of the latter Co., and is nearly to the line. The waste rock and ore is hoisted through the main shaft of the North Discovery ground.

The Golden Chariot mine is being worked under considerable disadvantage, on account of the great distance of the shaft eastward of the ledge. At the 8th level it was found necessary to run a cut 75 ft. in order to tap the ledge, and at the 9th level it would take a cross cut of more than 100 ft. to connect the shaft with the ledge. Supt. Davies proposes, if his Co. is willing, to remedy this, and save the expense of running cross cuts by constructing a new shaft—with 3 compartments, 2 for hoisting and 1 for pumping—down through the old stopes on the same incline as the vein. The mine sent 800 tons of the ore to the Owyhee mill last month.

The South Chariot Co. is still running its 4th level drift north. The drift is in 200 ft. from the shaft, or 268 ft. from this south line. In the face of the drift, the ledge is considerably split up, but the walls are good.

An immense rich body of ore is said to have been struck in the winze of the War Eagle mine this week, which is creating considerable stir in camp.

Mr. Knott continues operations in his Florida Mountain mine and has been rushing the ore down to the Cosmos mill for several days past.

Montana.

Helena Reduction Works.—Helena *Gazette*, Jan. 29: The last furnace lighted is yielding at the rate of 2,000 lbs. of bullion every 24 hours. The product from 6 P. M. on Tuesday to the same hour last evening, was 38 bars, weighing from 53 to 55 lbs. each. Another furnace will be fired to-morrow.

Utah.

Pioche Bullion.—Salt Lake *Tribune*, Feb. 3: During the last week, W. F. & Co. have received and forwarded the following lots of fine bullion from Pioche. Jan. 27, 6 bars, $7,538.20; Jan. 29, 7 bars, $9,188.29; Jan. 31, 7 bars, $9,066.42; Feb. 1, 16 bars, $49,003.40. Total, $74,816.31. Today 6 bars more will be received which will swell the amount to more than $80,000.

New Gold Field.—By telegraph—St. George, Feb. 3. Rich discoveries of gold are reported on the bars of the Colorado river, below the mouth of Diamond river, and about 100 miles south of this place. With copper sheets $14 per day can be washed out by one man. Miners are constantly passing through here *en route* for the new El Dorado, and large numbers are going up the Colorado from Lower Cal. and Arizona.

The Silver Belt dist., near Pinto, is creating considerable excitement among prospectors, and new discoveries are being made. The average assay of the ores in that dist. is about $50 per ton silver.

S. F. Stock Exchange Board.

San Francisco, February 15, 1872.

The mining share market has fluctuated considerably during the past week and transactions generally have been large. Friday, stocks were rather weak; Saturday, very much depressed, and a general collapse to a certain extent; Monday, further depressed; Tuesday, strong again; Wednesday, fair, and to-day the excitement had quieted down materially, all descriptions show a marked decline over prices of last Thursday.

The receipts from the North Star mine, at Grass Valley, for the month, aggregate $22,330. The sales for the week ending Wednesday the 7th inst., at the Stock Board, amounted to the unprecedented sum of $8,045,600; for the previous week they amounted to $4,208,000. Saturday last showed a very marked decline in the prices of mining stocks, all the prominent Washoe descriptions being lower and the decline being from $10 to $90 per share from the day before. The last clean-up of the Succor mine yielded $8,200, and that of the Virtue mine $3,350; the yield of the latter for January was $7,500. The January receipts from the Meadow Valley mine were $141,000, and on this month's account $25,300 have been received. Last week 796 tons of ore were taken from the Crown Point mine, valued at $33,000, and 888 tons from the Chollar-Potosi, assaying $48.62 per ton.

The Lemon Mill & Mining Co. elected the following Trustees on the 10th inst.; G. W. Clark (President), John Hahn, H. H. Shafer, H. Baroilhet, and F. A. Oliver. J. T. Milliken was re-elected Secretary and G. Dussol, Treasurer.

Last week the Savage mine produced 987 tons of ore averaging $37.47. On the 10th inst. the Superintendent of the Raymond & Ely mine sent down $18,300 from the old mill.

Wastage of the Precious Metals.

BY ALMARIN B. PAUL.

[Written for the PRESS.]

The fact that a high percentage of the precious metals is loet in the manipulating of ores hy the present modee of working, no one for a moment questions; hut when it comes to any special data, hut little has heen presented to the puhlic. Some aseort their lose to he only a trifle, while others, who more closely investigate, know it to be greater than it should be. Shakespeare says, "He who knoweth not what is lost, loseth nothing;" and in that senee, some lose notbing; hut invectigation shows that it is too enormous to he continued. The precious metals are the life hlood of the nation, tbe vital element that electrifiee and ennerve a people. They spread comforts and expand ideas, and with tbeir abundance nations as well as iudividuals dare to act. While their scarcity cauees all to shrink within themselves, deadening a life, that otherwise might shine with startling brilliancy.

It therefore behoves all to augment the yield, and the first step to that end is a clear realization of the loss.

Having closely investigated the eubject forthe past five years, I find the average loss so great, tbat really I think, if there is not more care taken in the husbanding of our richos, when extracted from the earth, the Government sbould take measures to do eo.

There is an idea that all gold is readily amalgamated, and therefore it is not neeessary to be so particular; consequently there is an unwarrantable degree of carelessnees. I have learned by practical working in both gold and silver that a higher percentage of silver ie more readily obtained by the known system of working for silver, than the percentage of gold hy *its* moet advanced system, showing that gold milling is far hehind silver working, although as before remarked, gold is considered so "readily amalgamated." Yet to adopt the eystems for gold that are used in silver, affords no especial relief.

That many readers may have eome data, as a corner-stone, to build tbeir ideae upon, before I go to far in my general obeervations, I will give a few tests of the many which I have made in the last two years, and intersperse with them, as additional evidence, views of other parties. And here I would call the reader's especial attention to the fact of a goodly percentage of eilver in all of our California ores; and I will also remark that the aesay of tailings does not even show what percentage of eilver the ores contain, as some may he in the form of chlorides which move off in the water. But to the tests of our gold mining.

TEST No. 1.—Average yield of ore in mill, $18.60. Wastage after complete washing, including concentrating,—Silver $3.14; Gold, $10.04; total $13.18.

TEST No. 2.—Same mill tailings 350 feet from mill,—Silver, $3,93; Gold, $5.02; total, $8.98 Showing that a percentage secreted itself in its passage down stream.

TEST No. 3.—Average yield of 150 tons, $3.50. Assays of tailings carefully sampled,—Silver, $6.28; Gold, $13.55; total, $18.83. Silver, $6.28; Gold, $8.79; total, $15.07.

The ahove bad results were occasioned by the extreme fineness of the gold. And even the ahove does not show the full wastage. To corrohorate this, I will give some admirable tests made to get at the qnestion of "float gold."

A friend of mine, having somewhat similar ideas to my own, concluded to test the question of float gold as well as he could at the time, and embraced the opportunity of cleaning up the slum from a water tank for supplying the hattery, where the water was used over and over again in conee-quence of its scarcity. The ores were worked after the usual wet metbod for gold ores. The water and pulp were first paesed through a sluice to tailing bed, 190 feet. The tailings heiug deposited, the water was drawn off at the top, flowing into a well, where it was raised, and passed through a sluice 120 feet to tank at battery. This is the tank cleaned up.

The residue was amalgamated in a tub quite rudely, hut with a large body of mercury and chemicals. The result was $33 in silver and $56 in gold, making a total of $89 per ton. It will he obsorved that there were two chances for the metals to precipitate previoue to reaching this tank:—first, in the tailing reservoir, and second, in the well.

This "float" metal question is further established by a system of teets made hy Mr. McDougal, of Grase Valley, who very kindly allowed me to extract the same from bis books of test. And here let me say that these teets are made from water flowing from mills at a point three-fourths of a mile belew the mills.

1st test of 20 gallons of water gave					1.10 cents
2d	"	"	"	"	2.13 "
3d	"	"	"	"	.95 "
4th	"	"	"	"	.83 "
5th	"	"	"	"	1.02 "
6th	"	"	"	"	1.13 "
7th	"	"	"	"	.97 "
8th	"	"	"	"	3.12 "
9th	"	"	"	"	1.07 "

11th	"	"	"	"	1.01 "
12th	"	"	"	"	.90 "
Average					1.18 "

It was eetimated that 576,000 gallons of this "muddy water" flowed hy every 24 hours, whicb, according to these tests, contain $339.84. Let us carry this calculation a little further.

The average amount of ore worked in 24 hours was given as 58 tons. This ehows that $5,85 per ton "floats," which probahly is at leaet 20 per cent. of the yield. Let us run this loss a little further. Suppose the two mills run 250 days in each year, which is not unreasonable, and we have a yearly loss in "float gold" alone, to say nothing of loes hy imperfect pulverization and general wastage, of $84,960.00 from two eingle mills.

Ae additional evidence, I introduce tbe following from a pamphlet of G. W. Baker.

In commenting upon the methods employed at *Morro Velho* for saving gold contained in sulphuret ores, the following statement was made in regard to the pulp issuing from the mills. It is copied again in view of fixing the authority upon which we assert the "loss hy flow," as an important item in our calculation.

1st. Free gold capahle of concentration hy washing.

2d. Free gold in a lamellar form, liable to be carried off in suspension by water.

3d. Mechanically combined gold, enclosed in particles of pyrites, hut capable of heing liberated by furtber grinding No mercury having heen allowed in tbe hattery, tbis pulp is properly thinned by adding water and then conducted "ovcr inclined platforms ahout eighteen inchee in width and from twenty-seven to thirty-five feet in length, which have a fall of one inch per foot. The first eixteen feet of these 'Strakes' are covered with hullock skins two feet two inches long, and of the width of the strake, tanned with the hair on them; a series of baize cloths, each two feet ten inches long, are employed helow these, which are again followed, at the lower end of the arrangement, hy another eeries of over-lapping skins. A certain quantity of finely divided gold is caught even on the last of theee ekins, wbilst a considerable portion, *estimated at ten per cent. of the total amount present, is carried off in suspension by the water.*" The last two lines are italicised to draw attention to the fact etated. Some time since, when we made it a little rough on Gilpin county practices, we stated that the assays of tailings puhlished by ue did not, and could not, show the lose actually carried off by the water. Here we find the estimate placed at ten per cent. after a *thirty-five feet of catch* has been passed over. How much more is the loss here, with no catch excepting amalgamated plates for a few feet?

[To be continued.]

A Beautiful Chemical Experiment.

The following heautiful chemical experiment may easily be performed hy a lady, to the great astonishment of a circle at her tea party: Take two or three leaves of red cahbage, cut them in small bits, put them into a baein, and pour a pint of hoiling water on them; let it stand an hour, then pour off the liquid in a decanter. It will be of a fine blue color. Then take four wine glasses; into ono put six drops of strong vinegar, another eix drops of solution of soda, into a third tbe same quantity of a strong solution of alum, and let the fourth glass remain empty. The glasses may be prepared eome time hefore, and the few drops of colorless liquids wbich have been placed in them will not he noticed. Fill up the glasses from the decanter, and the liquid poured into the glass containing tbe acid will quickly become a beautiful red, that in the glass containing the soda will be a fine green, that pourcd in the empty one will remain unchanged. By adding a littlo vinegar to the green it will immediately change to a red, and adding a little solution of soda to the red it will assume a fine green, thue showing the actions of acids and alkalies on vegetahle hlues.

The Acorn Woodpecker.

The accompanying cut represents the result of the woodpeckers' industry and forethought in providing for himself provisions for winter use, and storing them where they are safe from tbe depredations of his enemies. In the forests of the Pacific slope these birds ahound, and their work may be seen on every thick-harked tree where acorns are plenty, the hark perforated with little holes from the hottom to tbe top. When it is horne in mind that one variety of trees grown in this State, the Sugar Pine, furnish the finest specimen of tree growth in the world, and that their trunks often form a perfectly true column for over 100 feet without a knot or hranch, towering altogether sometimes over 200 feet high, these iudustrious little birds must have a good deal of work to do to perforate the bark of such trees, as they often do almost continuously, from the lower hranches to within twenty feet of the ground.

Somo old weather-wise individuals claim that these husy little elfs unerringly foretell in autumn the severity of the approaching season hy the numher of acorns they put in store for winter, hiding away unusually large quantities before our

hardest seasone. Whether this he so or not, they display great ingenuity in the manner in which they out the holes, for they are made in such a manner that the squirrels oan not take the acorns out. The acorns in this country are much larger than those in the Eastern States, and the birds cut a hole ahout two iuches long, push in the acorn and drive it in tight with their hills in such a manner that it is difficult to extract it even with a knife. They never put an acorn twice in the same hole and as a consequence the trees of our forests are pretty generally covered with them. At any time duriug the autumn the traveler may hear tbeir peculiar drumming eound as he passes through the woods. Some people state that they never eat the acorn itself hut the littlc worm which is alwaye found iu them after a certain time, which accounts ior their not consuming them early in the winter. However this may he the acorns are pretty generally destroyed hy spring, and the little holes with the shuck of the acorn remain to show where the woodpecker's storehouse has heen.

A LIVE FISH EMBEDDED IN ICE.—A small fisb, imhedded in ice, was found by some workmen engaged in taking ice from the Humholdt to fill the ice-house of Mr. Haynes. The little fellow was eolidly encased in ice as clear as crystal, and when placed in water and the ice gradually melted from about it, its rigidity left, the tail quivered, and after turning over a few times it swam away as if nothing had happened. How long his minnow-sbip had been thus housed is not known but probahly not less than two months. It is now a companion of the gold fish at Haynes' saloon.—*Ex.*

A miniature steam-engine, built of gold, set with diamonds, and standing on a three-cent piece, was one of the attractions at the Schenectady Masonic bazaar.

THE United States issued during the year 1871 ahout $500,000,000 of postage stamps.

The Strike in the Savage Mine.

The following article which we condense slightly from the Virginia *Enterprise* of the 8th inst., shows the wonderful extent of the Comstock lode and gives a good description of the late strike in the Savage which has caused such an excitemeut in stock.

A Look at the New Strike.

Yesterday, for the first time since the report of a strike in the Savage mine, visitors were allowed to enter the mine and examine the new development. Calling upon Colonel Shamp, Superintendent of the mine, at his office, we received an order directing the foreman to admit us to the underground regione under his supervision.

Down the Incline.

Upon landing at the hottom of the shaft we were furnished with candles and then marched Indian file eastward along a tunnel a distance of something over one hundred feet. Here we reached the incline, which runs down from the main shaft eastward at an angle of thirty-eight degrees. In this incline, which is spacious and most suhstantially timbered, on one side a car track and on the other the pump column and a flight of steps. Single file we descended the etaire a distance of 170 feet. This brought us to a drift opening on the south side of the incline and to the now famoue 1,400-ft level, where center the hopes and fears of so many persone on the Pacific Coast.

The New Development.

Stepping from the incline into the mouth of the drift last mentioned, we advauced along it eouth, 29 degrees eaet, a dietance of 100 feet, and hefore ue was the spot in which the new deposit of ore hae been found. Some workmen were engaged in extending the drift still further southward, while on our right, or to the west, a cross-cut about 25 feet in length had been made. In this cross-cut, in hut a ehort distance from the drift, is that part of the new hody which containe the rich hlack eulpburet ore which appears to be the centre and heart of the new development. It ie from four to six feet in width and is filled with streaks and hunches of exceedingly rich hlack sulphuret ore. On each side of this central streak thore is good ore for eome feet, hut going west it gradually diminishes in richness, till at the end of the cross-cut it is of little or no value; to the eastward it eeeme to taper off much in the same way, though in that direction no cross-cut from the drift bae been made. Altogether there may be said to he a width of about 20 feet of ore, the richest of wbich is the part containing the hlack sulphuret rock. They seem to have struck upon the north end of a body of ore which is opening out to the southward.

The first traces of pay-ore are found in the drift back to the northward, near 30 feet from the cross-cut, and the appearance of the rock steadily improved to where the cross-cut west was made. In examining this cross-cut at the point where it passes through the hlack sulphuret section more good ore will be found on the south than on the north side; indeed everything seems to indicate that if there be a large body of ore found it will lie to the soutbward. Thus far all tho openinge that have been made into the deposit are the drift running eouth and the croes-cut from it to the weet. What may be ten feet ahead in any direction no one can tell; hut there is every indication that in going that far south etill fine ore would he found. This new development is the moet important that has been made in years on the north end of the Comstock, in that it proves the existence of rich deposits of ore at the greatest depths, and, cheers, encourages and gives new life to all the mining companies at work upon this end of the great lode.

Still Another Level.

From the 1,400-foot level the incline is being vigorouely pusbed on down, and is now within 50 feet of the point where another level—the 1,500—will be opened. At this great depth no water is fonnd; indeed, instead of pumping, the little water found above is from time to time run down the pump column to the end of the incline for use in hlasting. The quantity thus sent down only serves to make it somewhat slushy at the bottom of the incline, and the surplue is sent up hy the car—it amounts to eo little. After leaving the tenth station—1,300-foot level—and entering the incline, the air is everywhere very hot, and causes the perspiration to stream from the visitor's every pore; but it is fresh and produces no dissagreeahle feeling. In coming to the surface, by the advice of Mr. Bonnomort we took the car from the 1,400-foot level and rode up to the 1,300, saving 170 feet of stairs.

Useful Information.

Gutta Percha Soles.—The method of putting gutta percha soles on leather is similar to this. First take all the nails out and rasp the sole all over as coarse as possible, then give it a coating of solution, made of gutta perch and naphtha, and let it dry. Then get your gutta percha, which has been boiled in water until quite soft, and work it with your hands until the water is out of it. Now get a lump that you believe will be enough to make the sole, and work it into a ball. Heat your hoot a little, and lay the ball on the centre of the sole, and with the palm of your hand spread it over, taking care to cover the whole. Give it a slight rap on an iron plate. In about half an hour cut it round with a hot piece of iron smoothly, and sand-paper it. The heels should have a little scooped out of the centre, which makes a good foundation for the lump to rest iu.

Antificial Milk Used in Paris During the Siege.—When natural milk became acarce in Paris, an artificial milk was made by dissolving 1¼ ounces of augar in a quart of water, addiug an ounce of dry albumin (from white of egg) and 15 to 30 grains of soda crystals, and then emnlsiouizing therein from 1¼ to 2 ounces of olivo oil. As the war progressed, golatin was subsituted for the albumin, and then slaughter-house fats—purified hy melting at 150° and then projecting in them small quantities of water—for the olive oil. One firm made in this latter way, 132,000 gallons of milk daily for Paris consumption.

The Australian Meats now sold in Europe, and elsewhere, have not found their way to this country, bnt it will not be long before the plan will he adopted here with our own meats. It has many advantagea which commend themselves. If a large business be done in the putting np of canned meats, and they are put upon tho market the same as oysters and canned fruits, tbere will be found economy hoth in price and ahsence of waste. It will particularly be a trade which will meet the demands of new towns in remote localitiea, which at certain seasons are almost without a market.

Aniertine.—Abiertine or extract of Fir Balsam, is a recently discovered agent which is commanding considerable attention. It is manufactured about forty miles above Oroville, the proprietore having put up works there for the distillation of the balsam from which it is made. It is highly recommended for cleaning type, taking paint and other stains out of clothing. It is also recommended for spraina, burna, neuralgia, tooth-ache, etc. Should this California production possess the virtue claimed, the discoverer and mannfacturer has made a profitable inveatment.

Whisky.—It is atated that when Russian troops are about to start on a march in a very cold region, no grog is allowed. The men once drawn up, it hecomes the corporal's duty to smell their breath and send back all who have been drinking. Many more examples might be cited, to prove that it ia the universal experience of all who have fairly tested it, that alcohol diminishes onr power to resist cold.

How is This?—An exchange (we find the paragraph among the "miscellany" of the *College Courant)* says: "Mr. S. S. Packard has for some years held open a standing offer to educate gratuitonsly fifty women in hia business college. He atates that the result has been two hundred applications, twenty trials, and two successes." What was his atandard of "success?"

A new description of carpet known as India Brussels, has been introduced of the same width aa ordinary tapestry Brussels, and aaid to possess an equally good appearance. It is made of a superior quality of wool, felted so as to make the fabric heavy and durable; and on the face are printed, in colors, designs of recent introduction.

The Bat's Wing.—It has heen found that the bat'a wing and the ear of the white mouse are most abundantly provided with nerves, apparently for the purpose of supplying, by means of a very refined seuse of touch, the imperfection of vision. The number of nerve endiugs on each ear of the white mouse are estimated at 6,000.

Beet Suoar in France.—The production of beet sugar in France gives employment to upwards of 400 factories.

Good Health.

Butter and Worms.—There is no doubt that the larvæ of the various worms which infest the alimentary canal of children, and frequently, too, of adnlts, are taken in with tho food. Greasy substances are apt to abound with them. In a late German medical journal, a Dr. Hubber relates many experiments he has made on tbis subject, and he comes to the conclusion that no article used by man as food, especially during childhood, is so prolific a canse of intestinal worms as butter. The use of butter serves also for the introdnction of insects, as well as worms; and, as American children seldom eat bread without a thick coatiug of butter, the general presence of intestinal worms need not be wondered at.—*Home and Hearth.*

Rioidity of the Jaws in Drownino Persons not a Sign of Death.—A recent writer assures us that the rigidity of the jaws in a person taken out of the water after long emersion, instead of being a sign of death, is really an indication that life is still present, as it disappears only when life is actually extinct. This, of course, is not to be confounded with the atiffening of the entire body after death, but refers entirely to the local symptoms. We aro, therefore, advised, under the circumstances indicated, not to lose hope, hut to continue to make use of all the methods that present themselves as appropriate for the restoration of suspended animation, whether hy the injection of air into the lungs, or by other means.

The Lamp in a Sick Room.—The following aimple arrangement will remedy the evil of foul gas, gcnerated by burniug a kerosene lamp all night in a nursery or sick room: Take a raisin or any other suitable aized box that will contain the lamp when set up on end. Place the lamp in the box, outside the window, with the open side facing the room. When there are blinds, the box can be attached to each hy leaving them a little open, and fastening with a cord; or the lamp box can be nailed to the window casing in a permanent manner. The lamp hurns quite as well outside, and a decided improvement of the air in the room is experienced.

Distinguishino Real from Apparent Death.—A new mode of distinguishing hetween real and apparent death has been recently submitted to the consideration of the Academy of Medicine, in Paris. It consists in the insertion of a hright steel needle into the body; and it is said that when life is present the needle soon becomes tarnished by oxidation; while, on the other hand, if death has taken place, the needle will retain its brightnesa for half an hour or more. According to Dr. Laborde, the author of the communication, oxidation, with its attendant electrical phenomena, indicates that death is only apparent, and the entire absence of oxidation is a sign of real death.

Quinine Biscuits.—A new dietary article haa heen introduced by the London bakers, in the shape of quinine biscuits. They are small, extremely well made, and have a pleasant and delicately bitter flavor. Each biscuit is estimated to contain one-fourth of a grain of quinine, and for delicate atomacha, or where it ie desirable to disgnise medicines as much aa possiblé, or to combine food with medicine in a perfectly agreeable form, these biscuits are likely to become very popular.

Lime.—We find the following in an exchange: A etanding antidote for poison by oak, ivy, etc., is to take a handful of quick lime, dissolve in water, let it etand half an hour, then paint the poisoned parts with it. Three or four applications will never fail to cure the most aggravated cases. Poison from bees, hornets, spider bites, etc., is instantly arrested hy the application of cqual parts of common salt and bicarbonate of soda, well rubbed in on the place bitten or atung.

Toothache.—A correspondent of the *English Magazine*, gives the following curious remedy: Put a piece of quick-lime as big as a walnut in a pint of water in a bottle. Clean the teeth with a little of it every morning, rinsing the mouth with clean water afterwards. If the teeth are good, it will preserve them and keep away toothache; if the teeth are gone, it will harden the gums so that they will masticate crusts and all.

Sore Mouth and Tonoue. — Three drachms of borax, two of sugar of lead, half an ounce of alum, and a pint of sage tea, will cure a sore mouth and tongue. It must be used as a wash.

A Deserted City.

Onr readers all remember the great Excelsior or Meadow Lako excitement of some half a dozen years ago, when ambitious crowds of fortune-hunters went rushing with bag and baggage over the Henness Pass route, among the tall pines, tamaracks and perpetual snows of the Sierra Nevada. Summit City, on the borders of the pretty little meadow Lake, sprang np from amid fresh pine stumps, developed into a big town, with broad streets, big hotels, fine drinking saloons and two burdy-gurdy houses, all in the space of six weeks. Gold Hill and Virginia were both plentifully represented, not only in town, bnt throughout the district. Everyhody made plenty of locations, and nohody felt sure of bis fortune unless he had "feet" in Excelsior, where the ledges were all rich. We know how it was onrself, for we aaw the clephant from stem to stern, and invested all our reportorial earnings therein, fortbwith, aud subsequent assessments kept us continually broke for three years afterward, till we got "froze out" entirely. The Grass Valley *Union*, of Jannary 26th, thus tella tbe present atatus of things "way over in Excelsior:"

Meadow Lake City, which was once called Summit City, boasted in the days gone by, of a population of 3,000 or 4,000 souls. In its day of prosperity it had fine atorcs, good hotels, theatres, aaloons in number, and an Exchange at which mining stocks were sold. Meadow Lake City was a second Virginia City, and attempted to revive the good daya of Washoe, the flusb times of the Comstock lead. In 1865, we think it was, some persons found gold-hearing rock in some ledges near Meadow Lake, and these being assayed and the assay being talked about, the city of Summit or Meadow Lake was horn. It sprung up, like Jonah's gourd, and in a night has withered. In the excitement which followed the discovery of quartz apecimens around Meadow Lake, fine houses were erected, and husiness promised to he brisk. The ledges, however, failed to yield up their treaaure "hy mill process," and people became disheartened. The sanguine held on in hopes that chemiatry would get the gold out of the rock where mechanism had failed. The ores were rebellious, it is said, and the ordinary appliances of atampa and quicksilver would not save the gold of those rich ledgcs. Chemistry would find a way to get the richness out of the rock. "Old people saw eigns and young people dreamed dreams" in efforts to save that gold. The Burna process was invented in a dream to save gold, and for a long time Meadow Lake City continued to hold its own in the hope of the auccess of the Burns dream. It failed, and the doubtera began to intimate that the gold was not in the rock, and the assayers were wrong or had been imposed upon. Mills, chemicals, and even dreams failed to make mining there a success. Science, mechanics and the black art had each failed in its turn to turn the rock into gold.

So the city went down and is deserted. A few daye ago a friend of ours visited Meadow Lake City. He went up on snow shoes and took a look at the deserted and snow-covered place. The houses which were only one story in hight were covered to tbeir roofs with snow. The two-story housea were surrounded with anow to the aecond story. Not a living being was to be aeen by him. He was monarch of that anowy desolation. Signs swung in the cold wind, and just grazed in their swinging the surface of the snow. Prominent among the signs was that of a broker'a office, just opposite the old hall of the Board of Brokers. The large hotel there was yet furnished, and beds and bedding remained there. Our friend, standing in his snow-shoes, gazed into the hotel while he stood on the enow surface, level with the second story, and he saw clean linen on the deserted beds. He wanted to take a rest in the comfortable looking quarters, but there was no fuel or food in sight, and he had to go down lower to a ditch-tender's cabin to get fire and appease his hunger. Many of the houses have this winter been broken down by the weight of snow on their roofs, but many more remain just as they were when their owners left. The property deserted is safe, as cold and snow have locked all against the depredation of burglars. Meadow Lake is a winter residence no more.—*Gold Hill News.*

Bessamer Steel Rails.—The ship Patroclus, recently arrived from Newport, Wales, brought 6,888 Bessamer steel rails for the Central Pacific Railroad. It is atated that this is the firat importation of this kind of rails to California.

Book Notices.

The Cabin Book, or National Characteristics. By Chas. Gealsfield. Translated from the German by Sarah Powell. St. John & Coffin, 198 Broadway, New York.

This is an amusing collection of tales which were told abont a cabin fire in Texas. The time during the independence of Texas. The personages, some of the most noted characters who took part in the struggle of that State for its independence. The stories themselves are told for the amusement of the company by the chief actors. One or two, however, are historical in character. Taken all in all the book is very pleasant reading and contributes not a little toward the stock of knowledge of the time just preceding the war with Mexico. The descriptions of Texas are all very vivid and in the main correct.

The Annual Illustrated Catalogue and Oarsmans' Manual for 1871.

This is a large quarto volume, 500 pages, printed in colors or tinted paper, containing 65 illustrations on wood, and 12 plates on etone, bound in gilt muslin, beveled edges.

We have received from the publiahers, Messrs. Waters, Balch & Co., 303 River street, Troy, N. Y., a copy of this work. It is especially addressed to the lovers of rowing in racing shells, thongh a considerable portion of the work is devoted to the interests of those who, less daring or less energetic, find enjoyment in paddling a canoe, or pulling a akiff that one can stand up in.

It givea a very good history of the chauges and improvements which have taken place in the construction of racing boats, since racing in boats first came in fashion, and this naturally leads to the discussion of the merits of the last change, *i. e.* the substitution of paper for wood in the outer sheathing of these boats. Tbe defects, which the bookclaima, are inherent in wooden aheathed boats, are acknowledged by many prominent oarsmen, and testimonials in support of the claims of the paper boat are not wanting. Besides being illustrated with many fine woodcuts which exhibit the variona atyles of boata in use in the United States for hunting and fishing, a very full list of the different rowing and hunting clubs in the United States and British Provinces is given. In a word, the amateur or professional oarsman will find in this volnme everything he wishea to know, whether on the subject of training, care of his boat, hoat building or the past history of boat racing. All this and mnch more he will find in the clearest of type, in the finest of tinted paper, and elegantly bound.

A new telegraph cable is talked of, bebetween New York and London.

Scientific Press.

W. B. EWER.....SENIOR EDITOR.

DEWEY & CO., Publishers.

Gold and Legal Tender Rates.

SAN FRANCISCO, Wednesday, February 14, 1872.—Legal Tenders buying 91; selling, 91¾. Gold in New York to-day, 110¼.

Table of Contents.

CORRESPONDENCE.—Universal Crop Reports, Humboldt County Mining Matters; 98. Wastage of the Precious Metals, 102.

EDITORIALS.—Silver in San Bernardino County; A Gold Mine in San Francisco, 97. Practical Science in New York, 98. Our Home Industries, 104. The Bullion Product of Nevada, 105.

ILLUSTRATIONS.—The Chlorination Process; A Patent Crab Wrench, 97. Niagara Falls, 105. The Acorn Woodpecker, 102.

MECHANICAL PROGRESS.—Asbestos for Piston Packing; Cheap City Transit; Revolution in the Method of Grinding Substances, 99.

SCIENTIFIC PROGRESS.—Current Scientific Progress; The Origin of the Heat of Fire; What is Going on in the Sun; Agricultural Chemistry; Flowers as Disinfectants; Curious Fact, 99.

USEFUL INFORMATION.—Gutta Percha Soles; Artificia Milk in Paris During the Siege; Australian Meats, Etc.; 103.

GOOD HEALTH.—Butter and Worms; The Lamp in the Sick Room; Distinguishing Real from Apparent Death; Quinine Biscuit, Etc., 103

DOMESTIC ECONOMY.—Philosophy of Frying; Save Your Bread Crumbs; Make the House Comfortable; Mechanical Hints, Etc., 107.

MISCELLANEOUS.—The Ramie Interests; The Strike in the Savage Mine; A Beautiful Chemical Experiment, 102. A Deserted City; Book Notices, 103.

Notices to Correspondents.

EDS. PRESS:—What can a miner do for himself when accidentally salivated by mercury in retorting, or otherwise?

We are told by a prominent quicksilver mine owner that at their works they found it best to have at hand a bottle of tincture of myrrh. A teaspoonful reduced by twice its amount of water. Rinse the mouth with it as strong as can be borne, *i. e.* gargle it. This is before the mouth becomes sore, but after the miner knows he has been exposed. After the system has been effected, take a solution of iron—Nichol's tincture of bark and iron is very good. The quicksilver has an effect to thin the blood, and the iron to restore it to its natural condition.

ONE DAY EARLIER.—We are now mailing the SCIENTIFIC PRESS from San Francisco on Friday afternoon, so that it may reach some points one day earlier than formerly. We are very careful and thorough in our mailing system, and if an occasional a subscriber does not get every number of his paper, we wish to know it, and we will do our best to find out where the fault may be and correct it.

ASBESTOS.—The Jackson *Dispatch* has seen a fine specimen of asbestos which was recently found in the upper part of Amador county. The mineral is supposed to exist in abundance in that locality.

UNIVERSAL CROP REPORTS.—The article on this subject referred to by Mr. Roach in his letter, in another column, was one which was written at the time that the letter of Lieut. Maury, on the subject of "grain reports," was going the rounds of the press here and in the East some four or five months ago. Mr. Roach, however, made the first suggestions on the subject in the *Examiner* long before Lieut. Maury's letter was published. Moreover, he gives a broader scope to the utility of the proposed system than Maury, from the fact of suggesting that it be made a subject of international treaty. The system is an important one and the honor of being the first to suggest its adoption should remain where it is due.

Our Home Industries.

This is usually the dullest season of the year for the foundries, yet most of the works are kept very busy and some are working up to their full capacity. They all look forward to a busy season and orders for work are coming in freely. One reason why business is at all slack, is the difficulty of forwarding freight, unless to points in immediate connection with the railroads, on account of the state of the roads incident to the bad weather we have had all over the coast.

The Risdon Iron and Locomotive Works,

Corner of Howard and Beale streets, are very busy, and employing about 250 men. They are making an engine, 20x30, and hoisting and pumping gear for the Gould & Curry mine. Have just shipped two hoisting engines 18x27 and gear to the Crown Point, and two, 20x30, to the Belcher mine. A quantity of mining machinery is being made for the Yellow Jacket. A number of narrow-gauge mining cars for the Eureka mine, Virginia City. Four large hoilers for the Sutro Tunnel are under way, and engines, boilers and pumps for the San Francisco Artificial Ice Co. They are altering the steam-tug, S. L. Mastick, from high to low pressure and putting in an improved surface condenser. Have just completed all the machinery and castings for the Pacific Gas works and the Metropolitan Gas works. They are kept very busy casting car wheels for the C. P. R. R., Southern P. R. R., Northern P. R. R., and supplying the city railroads with street car wheels.

About six miles of water pipe are being manufactured for the Pioche Water Works. This pipe is 5⅛ inches in diameter and made of 16th iron. Some of it was subjected to a pressure of 800 pounds recently, which is equal to a head of 1,860 feet. The pipes remained perfectly tight under this heavy pressure—a somewhat remarkable fact. A mile of 30-inch pipe is being made for the Dutch Flat Co., also pipe for the Independent Mining Co., Butte county. They are building a railroad for the Pacific Mail Co. for the purpose of unloading coal ships and coaling up steamers by steam winches and a travelling steam crane. A number of hydraulic water hoists are being made for this city.

The Union Iron Works,

Corner of First and Mission streets, are very busy and are employing about 320 men—almost a full force. They are making extensive repairs and additions to their already large working facilities and are preparing for a heavy season. A large amount of mining machinery is being made for the Overman mine, among which is a 300-horse power engine and four large pumps. They are filling extensive orders from the Japanese Government in machinery for gun boats, irrigating pumps, etc; one of the advantages derived from a more close acquaintance with that nation and our facilities for steam communication. Considerable work is being turned out for the Orcbilla Company, Magdalena Bay, and for the California Powder Co. A flouring mill is being put up, to go to Watsonville, and a large amount of general jobbing work is being done.

Pacific Iron Works,

Corner of First and Fremont streets, are turning out some work connected with the holder and retorting and distilling works for the Metropolitan Gas Works; are making machinery for a steamboat on Owens Lake, and during the past month they have manufactured a good deal of mining machinery to go to Mexico. They are doing the usual amount of general jobbing work. At the

Fulton Foundry and Iron Works,

corner of Tehama and Fremont streets, they have just completed a 10-stamp mill with three of Varney's pans and three settlers, same make, for the Guadalupe de los Reyes mine, Mexico. They are getting up sawmill machinery for Evans & Co., Eureka, Humboldt Co., doing work for the Pacific Stone Co., and making retorts and other castings for the San Francisco Chemical Works. A hand car and a very neat little passenger car for the Sutro Tunnel are standing in the shop ready for shipment. Castings are being made for the City Railroad Co. and for the Spring Valley Water Co. They are getting up a hydraulic press for the Shot and Lead Pipe Works, making shoes and dies for the Manhattan Mining Co., turning out machinery for the Oakland Cotton Manufacturing Co., and doing considerable jobbing work.

The Etna Iron Works,

Corner of Fremont and Tehama streets, are at work on machinery for Flint, Peabody & Co's. Barrel Factory, repairing machinery for the Golden Gate and Commercial flour mills, and making bead blocks for Renton, Smith & Co., lumber men. They are also making a large cast-iron propeller for Goodall & Nelson, malt rolls for the Philadelphia Brewery, and doing repair work for the Bay Sugar Refinery. They have also received orders for four of Thier's patent automatic pumps and fog alarm, for the Government vessels on this Coast and are doing considerable small work. At the

Miners' Foundry,

First street, between Howard and Folsom, (co-operative) we saw two diamond drills mounted on cars for tunelling work, for Severance & Co. They are putting up an engine boiler and batteries for the San Francisco Copper Works, and a pony-gang sawmill to go up the coast. Also a quartz crusher to go to Arizona, and one of Crocker's trip-hammer batteries to go to Dun Glen, Nevada.

The Golden State Iron Works,

No. 19 First street, are turning out work for the quicksilver furnaces at Pope Valley, and considerable quartz-mill work, castings, etc., to go to Virginia and Gold Hill; making hoisting and pumping machinery for the Manhattan quicksilver mine, Knoxville, Lake county. For the Oaklaud Railroad Co. they are making horse powers and pumping machinery, and are turning out hydraulic pipes, elbows and distributors to go to Dutch Flat, besides considerable small work. At the

San Francisco Boiler Works

Nos. 123 and 125 Beale street, a gasometer is being made to be used at the residence of Milton S. Latham, Menlo Park. They are also making a large boiler for Pope and Talbot, one 68 inches in diameter for the Portland Water Co., Oregon, another for the South San Francisco refinery, and one for the Kimball Carriage Factory in this city, all of large size. The one intended for Pope & Talbot is somewhat peculiar, all the fire surface being made of cast steel 5-16th of an inch thick. This is among the first of the kind made here; two were sent by the same works to the Almaden mine some 11 years since and are standing well yet; there is also one of the same style at Tay, Brooks & Backus' foundry, across the bay. They are making coke cars for the new gas company at the Portrero, overhauling engines and boilers belonging to the ice company and doing considerable steamboat work.

San Francisco Screw Bolt Works,

Phelps Bros.' proprietors, Nos. 13 and 15 Drum street, commenced operations in this city in 1863. Within the past year many important improvements have been made and their business has consequently been greatly extended. The main buildings are 137x45 and two stories high. All the bolts are manufactured by machinery; 23 men being employed. The Emerson patent bolt heading machine is used here, and is furnished also, ready for use, to purchasers of State and county rights, the castings and drawings alone being forwarded when so desired. The attention of bolt manufacturers and railroad companies is particularly called to this machine, two of which, we believe, have recently been turned out at this establishment for the Central Pacific R. R.

A. L. Fish,

Agent for Knowles' Patent Steam Pump, No. 9 Front street, has in front of his place a pump of the above named pattern, with a water cylinder 30 inches in diameter, which is calculated to throw 73 gallons a stroke, or 4,000 per minute. The pump was made for Stevenson & Son, at the mouth of the Merced river, for the purpose of irrigating their land. They have a tract of some 10,000 acres and are going to cultivate a considerable portion of it. Two of these pumps were sent to the Sutro tunnel this week and a number of orders have been received from all parts of the country for more.

Australian News.

The steamship Moses Taylor which arrived on the 4th inst. brings us some news concerning the mining interest in Australia. Reports of extraordinary yields of gold continue to be received from the Tambaroora gold fields. The crushings for one week were, according to the Sydney *Herald* of Dec. 22: Byers & Kerr from 22 tons realized 650¼ ozs., and 28 tons from the same claim yielded 761 ozs. Halman & Co. crushed 56½ tons which returned 1,650 ozs. and 80 tons of second-class rock yielded 1,076 ozs.

The same paper says that the appendix to the gold fields' Royal Commission contains a number of interesting papers one of which is a return stating the quantity and value of gold received by escort from the several gold fields of the colony from the 1st of January, 1871 to the 30th of September. The amount received by the western escort was 140,532 ozs., of the value of £543,197. The amount received by the southern escort was 53,503 ozs. valued at £202,614. The gold brought by escort from the northern gold fields was 11,522 ozs. valued at £44,198. The total amount brougbt by escort from all the gold fields during the period above specified was 205,557 ozs. worth £790,000. The value of the gold received by escort in the whole of 1870 was £763,655.

A large area of rich tin-bearing land has been taken up at Cope's Creek, in the Inverell district. Fourteen ounces of tin were washed out of one quart of earth on one claim.

An extensive copper mine has recently been discovered near Bourke, and a company has been formed to work a selection.

The gold Commission, in their recently published report, recommend the establishment to a separate and distinct department to mines under a responsible Minister of the Crown.

The yield of gold from the Western gold fields, for the last month, has been greater than for a long time past. On the 24th of November, an escort left Guloug with 7,809 ounces of gold, and on the 27th of the same month an escort left Grenfell with 2,188 ounces. An escort which set out from Mudgee on the 21st of December had with it 8,230 ounces of the precious metal.

Messrs. Paxton have just finished at Hill End a crushing of 253 tons of quartz, which yielded 3,317 ounces of gold. The claim declares a dividend of £2,148 per share for thirteen weeks' work.

Marysville Foundry.

In a notice of the Marysville Foundry which we published last week we expressed a wish to have a report from month to month of the work which the new firm turns out. The Marysville *Appeal* in copying our item says: We would like to accommodate the *Press* with a full monthly report of this live institution, but can not, for we have not the data from which to make the articles. But we will come as near it as we can, in a few words. The foundry and machine shop now employ thirty men. The work is mostly on mill and mining machinery. They are now engaged in building two saw mills, and are about to commence a twenty-stamp mill for the Salt Lake country. They are also building quartz mills for White Pine, Nevada, besides being engaged on mining machinery other than quartz and sawmills. They are about commencing the erection of some small engines, for the use of printing offices and other places where light horse power is required. Mr. Eckhart is the patentee of the engine, and the inventor also, and has already put up some on this coast, one of which is employed in a Vallejo newspaper office. There, Mr. *Press*, is a short report of what the foundry is doing.

We are very much obliged to the *Appeal* for their kindness in accomodating us with the above items so soon after we asked for them.

IMPROVED SLUICE.—In answer to enquiries, we would say that we believe that Frey and Evans' pateut sluice, advertised in our columns by Waters, of Sacramento, is a good article for many of our mines. We advise enquirers to write to the patentees and inform themselves; also to those who have used them.

Niagara Falls.—Its Physical Changes.

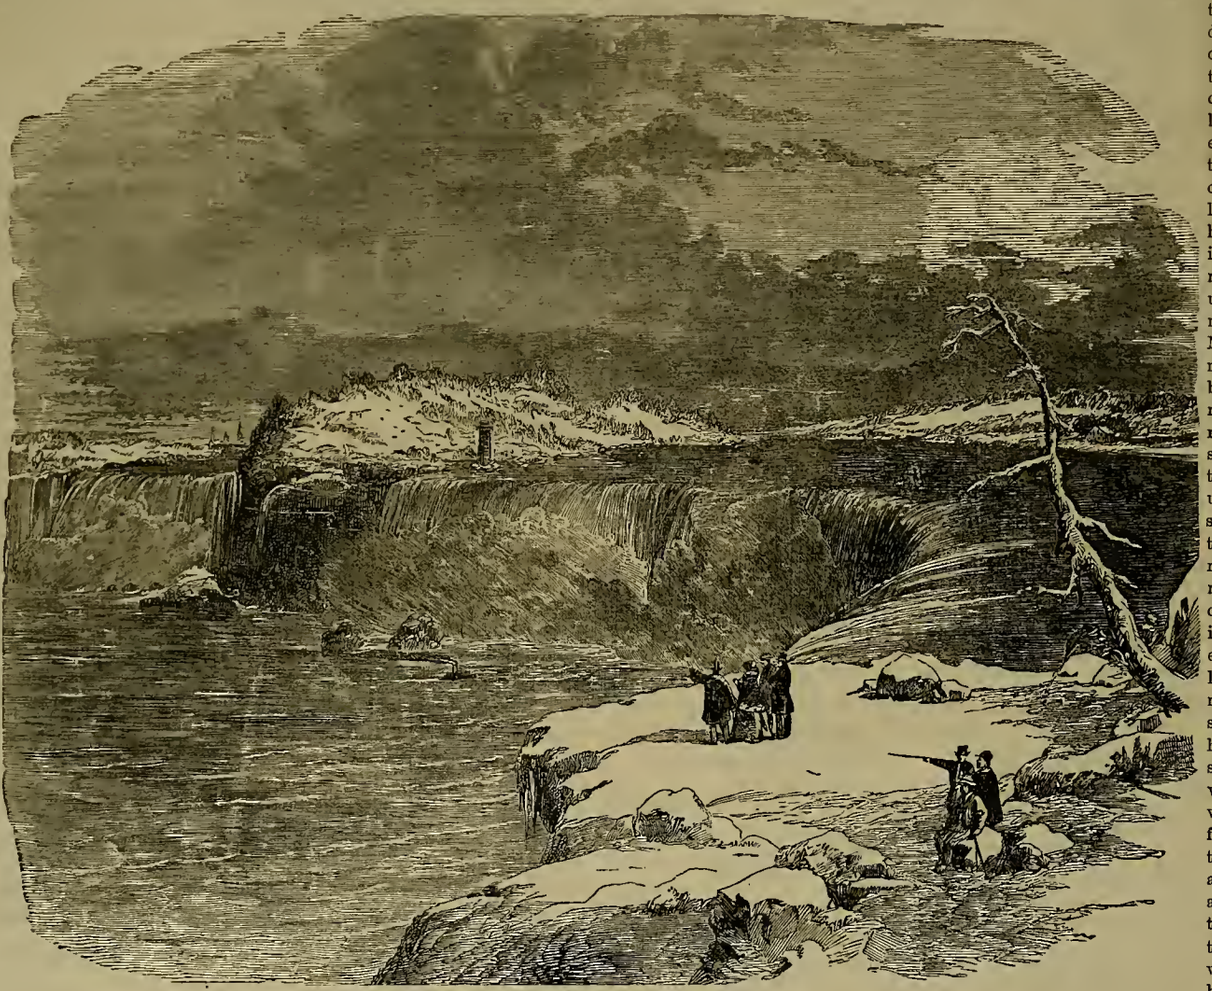
The view of Niagara which we herewith present is a most accurate and excellent one, and represents the Falls as they appear on a pleasant winters day. The description of the general appearance of these falls and their surroundings is so familiar to every American reader that it is not necessary we should repeat it here; but the geology of the region, and the changes which are being wrought in the locality by the action of this immense fall of water is a matter not so generally known, and is well worth attention for a moment.

This great sheet of water is precipitated over a ledge of hard limestone lying in horizontal strata, below which, but considerably above the bottom of the fall, is a strata of soft shale, which wears away, under the action of the water, much faster than the overlying limestone. As a consequence of this peculiarity, a projecting roof of limestone is always overhanging the water below. This overhang, at the present time, in some places projects 40 feet or more over the boiling waters, and thus there must be a point where the overhanging mass will break off and cause the falls, at that point to recede a distance equal to the extent of the break.

It is estimated that this continual destruction of the underlying rocks and the occasional breaks of the overhanging mass, is causing the falls to recede at an average rate of from two to three feet a year. There is no doubt that within the present geological period they have moved up stream, from Queenstown, seven miles to their present position—Queenstown being the point where the river merges into the plain, and below which there could have been no falls. This retrocession is still going on. A large projection on the Canadian bank, known as Table Rock, partly fell off in 1863, and there is good reason to expect other similar breaks and slides at a very early day.

There is another very significant consideration inseperable from the fact of this retrocession: The falls are about 160 feet high, while Lake Erie is but 70 feet deep, the river having a fall of some 30 or 40 feet from the outlet of the lake to the top of the falls; hence if the falls continue to recede, as they must, the time will come when Lake Erie will be completely drained, nothing being left of it but a river, following its central and deepest channel from Detroit to Buffalo. It may be some consolation, however, to the present holders of wharf property on that lake to know that the distance from the Falls to the Lake is about 20 miles; hence if the retrocession is no more rapid than now estimated, it will be about 40,000 years before the catastrophe will be realized.

To Californians, who, perhaps, more than almost any other people, have learned to realize the mighty influence of water in moving and wearing away rocks and other heavy masses, the results above hinted at will not appear at all strange, when the fact is kept in mind that the mass of water pouring over Niagara, even in average seasons, is not less than *one million of tons per minute!* When we reflect upon the terribly destructive force produced by the constant fall of such a mass from the hight of 160 feet, added to the abrasive effect of the whirlpools in undermining the soft underlying strata below, the wonder is that the action is not much more perceptible and rapid than above estimated.



NIAGARA FALLS—WINTER VIEW.

THE COMSTOCK MINES.—It is the fashion among very superficial persons to assert that the Comstock mines have been a bill of expense rather than a profit to stockholders. Such random assertions, however, are made with a perfect disregard to the case, as will be seen by the following figures which have been compiled by the *Alta*:—"The fifteen leading mines (on the Comstock lode) show the product, according to the annual reports, from their origin to August last, to have been $84,355,002; the assessments in the same time were $7,691,058; the dividends $19,991,058; being $12,300,000 net dividends, or 14 per cent. of the production. If we take the thirteen mines exclusive of the Belcher and Crown Point, the facts are as follows:

Total production to August, 1871	$76,449,083
Dividends, less assessments	13,269,300
Value of mines at market prices	4,783,100

Thus these mines paid an average of 20 per cent. of their market prices per annum during their whole existence, and that when mining was in its infancy and the operation a costly experiment. The facts now go to show that when full knowledge of the business has been acquired and easy means of transportation, development and production have been furnished, the ores are coming in again at more than their old values and the properties are more valuable than ever."

SUTRO TUNNEL.—The Sutro Tunnel company are pursuing their operations actively. The Virginia *Enterprise* says that the engines for each of the four shafts are now on the ground and will be shortly set up. The hoisting gear and other machinery for the several shafts are also in Virginia City. Teams are busy hauling to the mouth of the tunnel the machinery of a first class machine shop which will be run by steam.

The Bullion Product of Nevada.

John J. Valentine, General Superintendent of Wells, Fargo & Co.'s Express, furnishes the following report of the bullion produced in the State of Nevada during the year 1871:

Aurora	$45,761 00	Oreana	6,900 00
Austin	965,536 17	Pioche	3,982,227 89
Belmont	263,963 14	Pine Grove	137,672 00
Battle Mt. Station	120,411 21	Palisade	27,129 83
Carson	119,636 20	Rye Patch	41,259 07
Carlin	27,811 35	Reno	192,977 14
Eureka	2,173,105 56	Silver City	200,800 00
Galena	206,357 00	Toano	40,034 00
Hamilton	1,239,420 38	Unionville	343,696 43
Mineral Hill	701,014 00	Virginia and Gold Hill	11,053,328 28
Mountain City	149,273 82	Wadsworth	20,276 36
Mill City	4,485 00		
Total			$22,177,045 75

These figures are as near correct as it is possible to get them, since they are furnished by the Express Co., through whose hands pass almost, if not quite all the bullion produced there. By these figures, it will be seen that in point of bullion production, Washoe ranks first, Pioche next, and Eureka third. In regard to the Washoe yield, all the mines together have produced less than $1,000,000 per month. This year, however, we may expect a much larger showing from that locality according to recent reports concerning the Comstock ledge. The Belcher and Crown Point ore body has alone turned out $1,000,000 per month, leaving all the other mines in the district out of the question, and with the prospective new mills and machinery it is to be hoped that the yield will be still greater.

White Pine District has not by any means came up to what was expected of it, and other districts not so well known to fame promise to exceed it and show more productive lodes. The English companies who own a large proportion of the property there are industrious and zealous miners and it is to be hoped that the enterprises in which they have invested their money, will yet give a favorable return. Pioche, which has sent away $3,982,227, is in a flourishing condition and the ledges in Ely District, in which it is located, are proving themselves more valuable in proportion to developments made. The *Bulletin* thinks that in a few years, with a multiplication of mills in the new districts, and with the more general use of improved reducing and separating processes the annual yield of the State of Nevada will rise to $40,000,000. Since most of the mines in Nevada are wholly or in part owned by persons residing in this State, we have direct interest in an increased yield of bullion, and the recent developments in the leading mines on the wonderful Comstock lode are as important to us as to the people of the State of Nevada.

The discovery of immense bodies of ore in this lode, in the different mines, of such magnitude, are well calculated to enhance the general mining interests of this coast, and to lead people who have money to invest to look more leniently upon the business of mining. No other business holds out better inducements for large returns for small ventures than this, but unfortunately such has been the management of the mines on this coast that mining is not looked upon as a legitimate business, but as a species of gambling. Men of small capital who have invested in good faith have seen their savings appropriated, and taken entirely out of their control without their being able to help it. These things are much to be deplored, but we hope ere long that a new era will dawn upon this important branch of our industry, and that the recent developments and the above figures will aid in strengthening the better feeling which already exists in favor of the much abused mining interest, that is in reality the bone and sinew of the Pacific Slope.

PLACERS IN SAN DIEGO COUNTY.—The telegraph informs us that some specimens of coarse placer gold taken out at the San Ysidro Ranch about 14 miles south of San Diego, have been shown in that place. They think that there is water enough in the vicinity to work the ground and that they will find good paying diggings.

MECHANICS' INSTITUTE REPORT.—We have received the report of the Eigbth Industrial Exhibition of the Mechanics' Institute of the city of San Francisco, held at the Pavilion of the Institute in August and Septemher 1871. It is voluminous, comprehensive in detail, and reflects credit upon the Secretary of the Institute, for his endeavors to keep pace with the requirements of the day and the progress of events, in giving a full and complete report of the workings of an institution or association that has already attained a position of interest and importance, second to no other of its class in the world. Its essays upon a diversity of subjects are of the highest order.

DOMESTIC ECONOMY.

The Philosophy of Frying.

All bonsekeepers know that to fry well, tbeir fat should be bot. Bnt they do not attend to it half as scrupulously as they would if tbey understood the true philosophy of it. Boiling, huhhling hot fat cannot penetrate anything, and cooks to perfection; tepid fat penetrates everywhere, and does not cook at all, bnt actually prevents cooking. Any housekeeper who reads this, and chooses to profit hy it, need never put any greasy, fried, half-cooked indigestible food upon ber tahle.

The whole secret consists in baving tbe fat hoiling hefore the tbings are put in. There is one other condition wbicb follows naturally from tbe first one, hut which is almost invariahly lost sight of even hy good cooks, and tbat is that tbe fat should entirely cover tbe article to he fried. The reason of this is, that tbe part not at once covered hy the fat remains cold, cools off the fat near it, and tben absorhs the tepid fat just tbe same as if it never had heen hot. Frying-pans sbould he deep, well filled, and beated to the boiling point, and tben it is easy to turn out fried food nicely crisp, hrown, and dry, on the outside, and perfectly soft, moist and well cooked within. It is a peculiarity of tbe outside crust of things fried in boiling fat tbat tbe fat itself drips off from it as readily as water; hence, well fried articles are neither greasy in appearance nor very greasy in reality. Frying ought to be as easy as hoiling.—*Christian Union.*

To Polish Silver, Brittania and Tin.—A lady for wbose judgment we bave tbe bighest respect, says tbe *American Rural Home*, declares the following to he worth tbe price of the *Rural Home* to all bonsekeepers in poor health. She accidentally discovered tbe effectiveness of the metbod awbile ago, bas cleaned all her tahle-ware hy it ever since, and says tbat very little etrengtb is required, and tbat tbe polish is much tbe best sbe ever used: Sprinkle freely, tbe best kind of dry zinc—No. 1, sucb as painters use—after ruhbing it fine witb a knife, upon a soft flannel cloth, or tbe top of an old woolen stocking will answer, tben ruh tbe silver, etc., witb the clotb, then brush off with tissue paper, or any clean soft clotb or paper, and all will be as brigbt as new.

Save Your Bread Crumbs.—Never tbrow away a bit of bread, if clean. Keep a sballow tin pan for tbe special purpose of drying etale bread. When tbe ovens are not in nse, slip in the pan of bread scraps, leaving tbe oven door open, that tbey may not scorch. As fast as one installment is well dried, roll it fine, keoping one side of your hread board for that special purpose, and tben sift it througb a moderately coarsé seive. Put the bread crumhs into a hag, and suspend it in some cool dry place, adding to it as you get more dried. Crumbs thus saved are very useful for stnffing, or to roll cbops, oysters, or scollops in, for frying, and just as good as cracker crumbs for every purpose.

Try It.—A well known writer on bousekeeping says there are people who raise the hest of wbeat, year after year, and live on fine flour always, and bave no idea how sweet, as well as bealtbful, the unholted or Grabam flour is. Make Grabam musb as you do corn meal basty-pudding, sifting the meal with your hand slowly into boilwater, stirring briskly meanwhile. A few minutes hoiling seems to cook it sufficiently, thougb many cook it longer. Sweetened cream is an excellent dressing for it, and then if you add fresh herries !—well just try it. Many persons like it witb unsweetend cream or milk, as tbey eat bastypudding.

To Preserve Pegged Boots and Shoes. It is said that if pegged hoots are occasionally dressed witb petroleum hetween the soles and upper leather, tbey will not rip. If the soles of boots and shoes are dressed with petroleum they will resist wet and wear well. The pegs, it is said, are not affected hy drynese after being well satnrated with the liquid.

Cottage Cheese.—Boil two chiokens till tender, take out all the hones and chop the meat fine, season to your taste with salt, pepper and hutter, pour in enough of the liquor they were hoiled in to make it moist, put iuto wbatever mold you wish, and when cold turn out and cut into slices. It ie excellent.

Make the House Comfortable.

We bave no patience with a man wbo allows tbe windows to rattle in tbe casements, while with a bammer, a few nails, a latb or two, and a little putty, he could, in an bour or two, make the liouse snug and comfortable. We believe in thorough ventilation, hut it should be under our control. There are thousands of homes where the inmates spend a wretched winter simply for want of a little attention to such matters. See that the outside doors fit snug. A damper in the stove-pipe prevents tbe beat from going up the cbimney, and saves fuel. See that the wood house is well supplied witb dry wood ready for tbe stove, and tbat there is some kiudling always prepared ready for use. Where coal is used and in tbe absence of cbarcoal, have a harrel of dry corn-cobs ready for starting fires.

Let the family room be well ligbted, and make home attractive to the young people. Let there he no lack of good hooks and useful papers. Pleasant winter evenings at home constitute one of the great charms of country life. It is bere tbat cbaracter is formed, and the future usefulness of our cbildren in a great degree determined. A comfortahle family room, warm beds, nutritious food, and plenty of sleep will enahle a farmer and his family to spend tbe winter pleasantly and profitahly. There is plenty work to be done, and the cold, instead of henumbing tbe faculties, will stimulate exertion. Do not spend your winter days hy tbe stove, or in complaining of hard times.

A Relish for Breakfast or Lunch.—Take a quarter of a pound of cbeese, good, fresh; cut it up in thin slices and put in a spider, turning over it a large cupful of sweet milk; add a quarter of a teaspoonful of dry mustard, a dash of pepper, a little salt and a piece of butter as large as a butternut; stir the mixture all tbe time. Have at band three Boston crackers finely powdered or rolled, and sprinkle tbem in gradually; as soon as tbey are stirred in, turn ont the contente into a warm dish and serve. It is very delicions.

Silver Tipped Shoes.—Sboes are an important item in tbe expense of clotbing children, as every parent will understand. Tbey invariably wear out their sboes at the toe first, and not unfreqnently before the otber parts are a quarter worn. Cbildren'e sboes witb silver or copper tips never wear out at tbe toe, and last twice as long as tbe ordinary shoe. Housekeepers will do well to remember this fact.

Mechanical Hints.

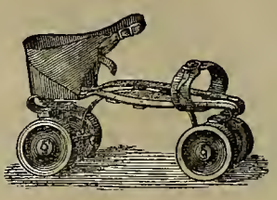
Facing Oil Stones.—A correspondent of tbe *Scientific American* says:—I have in the course of my life spent a good deal of time in facing off my oil stones. I bave used sand on a board, wet and dry, or an old mill stone, or a bard brick. If the oil stone was eoft, it could be cut or ruhbed down in a short time; but if a hard one it was a serious job. The tbougbt struck me ahout two years ago that emery would be the thing to quickly cut a bard stone, whicb I bave. I dressed of a white pine board, put a thin coat of glue on it, when dry put on anotber, sprinkled coarse emery on the glue, ruhbed it in well, and wben dry put on anotber coat of glue and emery. I bave heen using it ever since; it does not take one-tentb of tbe time to face off tbat stone than it formerly did witb sand, etc. Tbis may save some one some bard rubbing.

Metal for Bearings.—The following alloy has heen found to give bigbly eatisfactory results for plummer hlocks, axles, hrasses, etc. To 30 parts of melted copper are added 70 parts of antimony; the mixture is melted, and run out into thin plates. These are then re-melted witb tin in the proportion of 90 parts of tin to 10 parts of the copper and antimony, and run out again into thin plates. When used, it is re-melted, and run into tbe forms required. M. Volk, of Regenshurg, bas employed an alloy for many years of wbich the following are the component parts:—Copper, 5-6 per cent.; antimony, 11-2 per cent.

Liquid Polish.—The preparation of hlacklead ready for use in a fluid state, is a recent Englisb invention. The composition adopted consists of hlacklead, sucb as is used for polisbing stoves and for other uses, combined witb turpentine, water and sugar or saccbarine matter, and the proportions wbich have heen found to answer well are, to each pound by weight of the blacklead, one gill of turpentine, one gill of water, and one ounce of sugar; but these proportions may be varied, and in some caeee all the ingredients are not neceesary.

The C-Spring Roller Skate.

PATENTED 1871.



Rights and Skates for Sale.

This superior Skats is now hsginning to attract the attention of Rink Owners, it heing the only Cramping Skate now hefore the pnhlic (except the Plympton Skate) that can run without infringing a former patent.

This Skate is Positively no Infringement

Of anyhody's patent. It is made in the most suhstantial and workmanlike manner, and possesses the following points of merit: Beauty, Elasticity, Ease of Movement, Strength, Lightness, and does not injure the skating floor as much as the ordinary skate.

Every pair Warranted to be just what it is rsprssented. Parties intending to

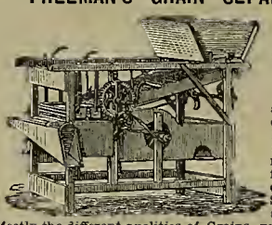
START A RINK,

Should examins and test this Skate. Sample pairs sent C. O. D. on application.

In ordering samples state the numher of boot or shoe worn, and whether for lady or gentleman.

☞ For City, County or Rink Rights, call on or address WIESTER & CO.,
No. 17 New Montgomery street (under Grand Hotel), SAN FRANCISCO.

FREEMAN'S GRAIN SEPARATOR.



THE BEST PATENT SEPARATOR MADE.

I will guarantee it to Excel any other Machine extant in separating Grain from all kinds of Foreign Seeds. It will separste perfectly the different qualities of Grains, producing pure Seed. It is in every way a Practical and Successful California Machine. It as proven successful over all other Machines on trial, and has taken two First Prsmiums at the Petaluma Fair. Machines and State and County Rights for sals by W. D. FREEMAN,
Tomales, Marin county, Cal.

Send for Circulars.

P. S.—The right to use my superior Patent Pod Screen will be sold at reasonahls prices to owners of Threshers. 4v3-2m-eowhp

Important to Miners.

GOLD-SAVING

Silver-Plated Amalgamating Plates

FOR MINERS AND MILL MEN,

At San Francisco Plating Works, 655 Mission Street, San Francisco.

Goods of every description Plated.

Old Goods Re-plated.

E. G. DENNISTON, Proprietor.
24v22-3m

Varney's Patent Amalgamator.

These Machines Stand Unrivaled.

☞ For rapidity pulverizing and amalgamating ores, they have no equal. No effort has heen, or will he spared, to have them constructed in the most perfsct manner, and of the great numher now in operation, not one has sver reqnired repairs. The constant and increasing dsmand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam hottoms, as desired.

This Amalgamator Operates as Follows:

The pan heing filled, the motion of the muller forces the pulp to the center, whers it is drawn down through the appertura and hetween the grinding surfaces.—Thsnce it is thrown to the periphery into the quicksilver. Ths curved plates again draw it to the center, where it passes down, and to the circumference as hefore. Thus it is constantly passing a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and ths metal amalgamated.

Setlers made on the same principle excel all others They bring the pulp so constantly and perfectly in contact with quicksilver, that ths particles ars rapidly and completely absorhed.

Mill-men are invited to examine thess pans and setlers for thsmselves, at the office, 229 Fremont Street, San Francisco.

JOHN TAYLOR & CO.,

IMPORTERS OF AND DEALERS IN

ASSAYERS' MATERIALS,

Chemical Apparatus and Chemicals,

Druggists' Glassware and Sundries,

PHOTOGRAPHIC GOODS, ETC.,

512 and 514 Washington street, SAN FRANCISCO.

We would call the special attention of Assayers, Chemists, Mining Companies, Milling Companies, Prospectors, etc., to our large and well adapted stock of

ASSAYERS' MATERIALS

—AND—

Chemical Apparatus,

Having heen engaged in furnishing these supplies since the first discovery of minss on the Pacific Coast.

WE ENUMERATE IN PART:

Assay Balances—L. Oertlings, London.
Assay Balances—Becker & Sons, Antwerp.
Chemical Balances—Becker & Sons, Antwerp.
Ore or Pulp Balances—Becker & Sons, Antwerp.
Assay Weights—Grains and Grammes.
Bullion Balances and Weights.
Humid Assay Apparatus.
Iron Furnaces—Improved, Lined with Fire Brick for Cupelling and Melting.

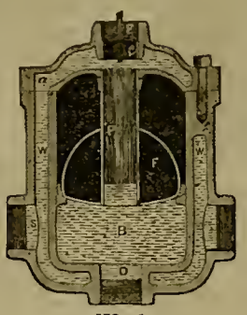
CRAIG & BREVOORT'S
Patent Condenser for Steam
PUMPS, &c.



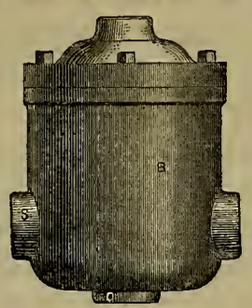
NO. 1.

The annexed engravings represent a Condenser intended to be attached to the ordinary steam pump, thereby bringing it within the class of low pressure, or more properly speaking, of condensing engines; the steam, when it has done its work in the cylinder, instead of being exhausted into the atmosphere, is conducted to the condenser, on its entry into which, it meets the water drawn by the pump, and is immediately condensed.

The Cut No. 1 represents a vertical section of the Condenser, and No. 2 an elevation.

The flange D is bolted to the suction orifice of the pump, and the flange S to the pipe leading to the well, or whatever source of supply the pump may have; W is a water jacket surrounding the main chamber of the condenser, B, and with which the suction pipe, S, communicates, permitting a free circulation of water within the jacket and into the hollow cover or top through the series of openings, one of which is shown at A, and from thence into the body of Condenser, B, through pipe P, carried by float F; the pipe P also acts automatically as a valve to enlarge or contract the space through which the water enters it, by which means the possibility of the condenser being at any time flooded is avoided. The pipe P, it will be observed, also acts as guide to float F.

The valve, C, (shown in Cut No. 1), which is raised or lowered by means of screwed stem—shown coming through elbow in Cut No. 2—is for the purpose of increasing or decreasing the flow of water according to the capacity of the pump to which it is attached.



NO. 2.

The exhaust pipe from steam cylinder is screwed into cover at E; the exhaust steam is thus thrown directly into contact with the water entering the condenser on its way to water cylinder of pump through D. A vacuum being of course immediately formed, acts on the exhaust side of the steam piston, aiding it in its work. If at any time it is desirable to run the pump without the condenser, it is only necessary to turn the three-way cock, which is placed in the exhaust pipe, into such a position as to cause the steam cylinder to exhaust into the atmosphere; when this is done the pump is perfectly free from the condenser, and acts as if it were not attached. This condenser is specially useful for pumps running in mines, or any other position where trouble is experienced in getting rid of the exhaust steam. Address H. L. BREVOORT,
6v23eowly 128 Broadway, New York City.

Orders will be received at the above office from all who wish to get good work at low prices. Send for Circular. 5v24-3ms1amrly

The California Powder Works
No. 314 CALIFORNIA STREET,
SAN FRANCISCO.
Manufacturers and have constantly on hand
SPORTING,
MINING,
And BLASTING
POWDER,
Of SUPERIOR QUALITY, FRESH FROM THE MILLS. It being constantly received and transported into the interior, is delivered to the consumer within a few days of the time of its manufacture, and is in every way superior to any other Powder in Market.
We have been awarded successively
Three Gold Medals
By the MECHANICS' INSTITUTE and the STATE AGRICULTURAL SOCIETY for the superiority of our products over all others.
We also call attention to our
HERCULES POWDER,
Which combines all the force of other strong explosive now in use, and the lifting force of the BEST BLASTING POWDER, thus making it vastly superior to any other compound now in use.
A circular containing a full description of this Powder can be obtained on application to our Office.

Amount of Rain Measured at San Luis Obispo, Cal.

EDITORS PRESS:—I send herewith a copy of my rain measurements in this town:

MONTH.	YEAR. 1869–70.	YEAR. 1870–71.	YEAR. 1871–2.
October	.84	.63	.00
November	.66	.38	2.40
December	.78	2.90	13.93
January	.71	1.51	5.16
February	4.85	4.43	....
March	.74	.00	....
April	2.40	2.79	....
May	.85	.28	....
Total	11.83	12.97	....

The rains this season have occurred as follows:

Nov. 26, 1871	1.90
Nov. 28, 1871	.50— 2.40
Dec. 17 and 18, 1871	2.00
Dec. 20 and 21, 1871	1.10
Dec. 23 and 24	6.00
Dec. 27 to 30	4.83—13.93
Jan. 1, 1872	1.64
Jan. 6 to 9, 1872	3.52— 6.16

The rain of December 23d was the heaviest I have ever seen—nearly the whole of it having fallen within 12 hours. These measurements are correct—being the mean of the records of two gauges placed in different positions, which seldom vary the tenth of an inch.

Respectfully, W. W. H.

Rainfall at Sacramento.

[By T. M. LOGAN, M. D., Secretary State Board of Health.]

Jan. 1, 1872. Rainfall for the season to date....12.421 inches
Feb. 11, 1872. Rainfall since above date..... 6.160 inches

Total for the season up to date.....18.581 inches

REMARKS.—The theory was advanced in some remarks relating to our annual rain table January 1, 1871, and which has been sustained thus far, that there is a general correspondence between the amount of rain falling before the 1st of January of each season, and the amount which falls afterwards. Thus, if the rainfall is below the average, as for instance in 1863-4, before the 1st of January, it will prove deficient afterwards; and on the other hand, if excessive before the 1st of January, as in 1867-8, it will maintain the same proportion subsequently. Basing our calculations on this standard, we may then expect, according to the above data, at least six inches more of rain during the balance of the present season, which will bring up the total to 24½ or 25 inches. Our agricultural friends will make a note of this, and regulate their operations accordingly.

COMPLETE VOLUMES

Of the SCIENTIFIC PRESS can be had from January 1, 1864, to date, at $3 per single vol. or $6 a year. They afford the cheapest and best information on mining and the industry of this coast of any work published.

Also—Bound volumes of the PACIFIC RURAL PRESS furnished at same rates from its commencement.

Mining Companies

Should advertise their Meetings, Assessments, and Sales, in the SCIENTIFIC PRESS. Rates more than one-half less than daily publications. Stockholders should take the hint and request their managers to truly economize by advertising in a MINING JOURNAL, where all notices may be seen by cheaply purchasing and examining a weekly. You will thus save money and uphold a journal which upholds your interests.

UNIVERSITY OF CALIFORNIA.—The Preparatory Department is under the charge of five Professors of the University, and six tutors.

Besides the studies of the public schools, Algebra, Geometry, Latin, Greek, German, French, Spanish and Book-Keeping are taught.

MARAVILLA COCOA.—No breakfast table is complete without this delicious beverage. The *Globe* says: "Various importers and manufacturers have attempted to attain a reputation for their prepared Cocoas, but we doubt whether any thorough success had been achieved until Messrs. Taylor Brothers discovered the extraordinary qualities of Maravilla Cocoa. Adapting their system of preparation to this finest of all species of the Theobroma, they have produced an article which supercedee every other Cocoa in the market. Entire solubility, a delicate aroma and a rare concentration of the purest elements of nutrition, distinguish the Maravilla Cocoa above all others. For homœopaths and invalids we could not recommend a more agreeable or valuable beverage." Sold in packets only by all Grocers, of whom also may be had Taylor Brothers, Original Homœopathic Cocoa and Soluble Chocolate Steam Mille—Brick Lane, London. Export Chicory Mills Bruges, Belgium. fe25-1y

PATENT SELF-OILERS

And Cylinder Cups

Save from 75 to 95 per cent. of Oil. No better investment for the amount can be made by any person having machinery or running shafting. They are so well known as to need no description. All the trouble of "oiling up" is avoided. There is no waste of oil, and no cans are needed. A single trial will prove their value.

We will put them into any mill, and if not perfectly satisfactory, they may be returned at our expense, and the price will be refunded. We have a large stock on hand, of all sizes, adapted to all descriptions of boxes.

ROOT'S PATENT FORCE BLAST ROTARY BLOWER.

MANUFACTURED AT

The Globe Iron Works, Stockton, Cal.

AWARDED THE FIRST PREMIUM AT THE PARIS EXPOSITION—PATENTED NOV. 1, 1864; JULY 24, 1866; AND OCT. 9, 1866.

Adapted FOR Smelting, Foundry, Mining and Steamships.

Requires **50 Per Cent.** LESS POWER Than any Blower Now in Use.

One of these Blowers may be seen at W. T. Garratt & Co.'s Brass Foundry, San Francisco; Gould & Curry and Savage S. M. Co.'s, Nevada; and at C. P. R. R. Co.'s Works, Sacramento; and other places on this coast.

CAUTION.—Purchasers will find it to their advantage to apply direct to the Stockton Agency, as certain parties, not authorized to manufacture the Blower, have put in the market machines of inferior construction, which do not answer all the requirements of the genuine article.

QUARTZ, SAW AND GRIST MILL, IRON, STATIONARY AND STEAMBOAT ENGINES, HORSE-POWER AND PUMPS, OF ALL SIZES.

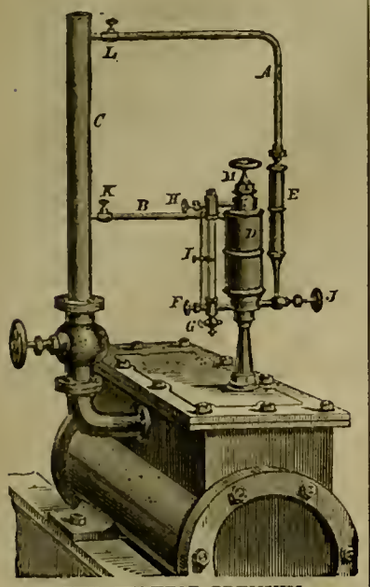
N. Seibert's Eureka Lubricators.



THE HIGHEST PREMIUM

Awarded by the Mechanics' Institute Fair, San Francisco, and State Fair, Sacramento, 1871.

These Lubricators are acknowledged by all engineers to be superior to any they have ever used; feed constantly by pressure of condensed water, supplied by pipe A, regulated under the oil by valve J, and forced out through check valve and pipe B into the steam pipe C; it then becomes greasy steam, passes to all the valves and cylinder at every stroke of the engine; glass tube I indicates amount used per hour. Packing on rods and stems lasts longer, and the rings on the piston will not corrode. One pint of oil will last from three to six days, according to speed and size of engine; I, sliding gauge; K, valve to shut off when engine stopps; H, F, valves to shut off in case of frost; steam does not enter the cnp; it is always cool; warranted to give satisfaction. Patented February 14, 1871. Manufactured by California Brass Works, 125 First street, S. F. 24v23tf

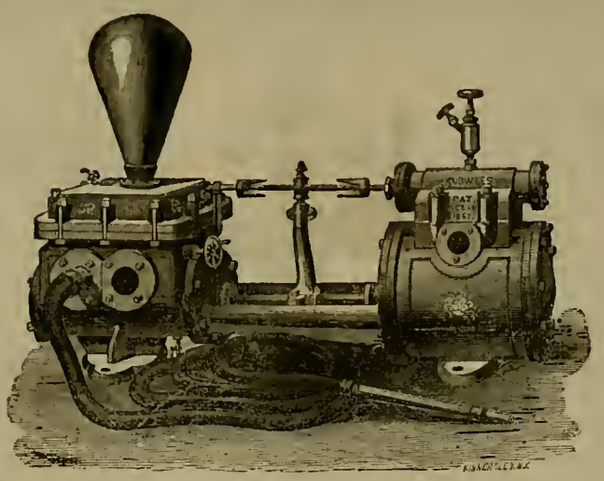
KNOWLES' PATENT STEAM PUMP.

Awarded First Premium and Diploma

Over all Competitors, at Mechanics' Institute Fair of San Francisco, 1871; also Special Medal and Diploma at State Fair.



It has no Cranks or Fly-Wheel, and has no dead points where it will stop, consequently it is always ready to start without using a starting-bar, and does not require hand-work to get it past the center. Will always start when the steam cylinder is filled with cold water of condensation.

The trial of Steam Pumps at the Eighth Industrial Fair in San Francisco, by a Committee of Five of the most thoroughly practical mechanics on this coast, showed the Knowles Pump to lose but 11½ per cent., while others lost as high as 40 per cent., showing great difference in economy.

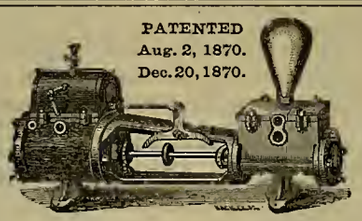
CENTRAL PACIFIC R. R., OFFICE OF THE GEN'L MASTER MECHANIC,
SACRAMENTO, Cal., April 14, 1871.

A. L. FISH, Esq., Agent of the Knowles' Steam Pump, San Francisco—Dear Sir: In reply to your inquiry as to the merits of the Knowles' Steam Pump, in use npon tbis road, I will say tbat we bave nineteen of them in use on this road as fire engines, and pumping water for shop and station use. I consider tbe Knowles Steam Pump tbe best in use, and prefer it to any other. Yours truly, A. J. STEVENS, General Master Mechanic.

WE BUILD AND HAVE CONSTANTLY ON HAND
THE LARGEST STOCK OF PUMPS IN THE WORLD,
And for Every Conceivable Purpose.
A. L. FISH, Agent.
No 9 First Street, San Francisco, Cal.

P. S.—All kinds of new and second-hand Machines on hand. 3v24-eow-bp

PATENTED
Aug. 2, 1870.
Dec. 20, 1870.



Combines Simplicity and Durability to a Remarkable Degree.

Its parts are easy of access, and it is adapted to all purposes for which Pumps are used—especially Mining.

Dewey & Co., U. S. and Foreign Patent Solicitors and Counsellors, Scientific Press Office. Principal Agency for the Pacific States. Established 1860.

OUR U. S. AND FOREIGN PATENT AGENCY presents many and important advantages as a Home Agency over all others by reasons of long establishment, great experience, thorough system, and intimate acquaintance with the subjects of invention in our own community. All worthy inventions patented through our Agency will have the benefit of an illustration or a description in the SCIENTIFIC PRESS. We transact every branch of Patent business, and obtain Patents in *all civilized countries*. The large majority of U. S and Foreign Patents granted to inventors on the Pacific Coast have been obtained through our Agency. We can give the best and most *reliable* advice as to the patentability of new inventions. ADVICE AND CIRCULARS FREE. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior.

ENGRAVING ON WOOD, of every kind, for illustrating machinery, buildings, trade circulars, labels, plain or in colors, designed and cut in the best style of the art by experts in our own office. Also, engraving on metals.

DEWEY & CO.,
Publishers, Patent Agents, and Engravers'
No. 338 Montgomery st., San Francisco, Cal.

THE SCIENTIFIC PRESS, devoted to Mining, Mechanic Arts, Inventions, Etc., published by DEWEY & CO., was established in 1860, and is now known as one of the most substantial and reliable industrial publications in America. $4 per annum. Single copies 10 cts.

FOR 25 CENTS we will send, postpaid, four sample copies (recent numbers) of the PRESS. This, we believe, will induce many to subscribe who have not yet read our paper. It is a cheap and valuable favor to send a friend anywhere.

ENGRAVING ON WOOD DESIGNING AND ENGRAVING on wood and for electrotype cuts of every description, done by superior artists at the office of the SCIENTIFIC PRESS. Fine Cuts made for Book and Newspaper Illustrations, and for Fancy Labels for printing in various colors; Monograms, Seals, etc., etc. Prompt execution and reasonable prices.

Mechanics' Institute.

Entrance 27 Post Street (bet. Kearny and Montgomery), SAN FRANCISCO.

The Library of Reference, the Library, Reading Room and Chess Room are open from 8 A.M. until 10 P.M. every day, (except Sundays and Legal Holidays).

The Society possesses a Library of 18,000 volumes—the most valuable technical and scientific library on the Coast, embracing the transactions of the leading Scientific Societies of the United States and Europe, (among which are the philosophical transactions of the Royal Society of Great Britain, complete), and the standard, scientific and technical works; and is in immediate receipt of all new standards publications.

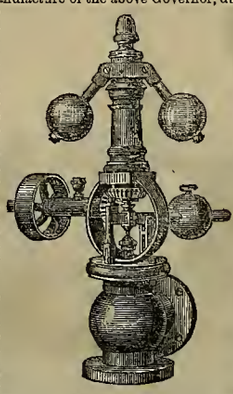
The Reading Room is supplied with the current periodicals and newspapers of the day.

The Mechanics' Institute is open to all, and the Trustees will be pleased to have visitors and others inspect the Rooms.

Entrance Fee, $1.00. Quarterly Dues (in advance) $1.50. Life Membership, $50.

THE GARDNER AUTOMATIC SAFETY-STOP GOVERNOR.

These Governors have now been sold in this market for several years, and wherever once introduced and made known, are invariably sought after. They are in the Eastern States fast displacing all other Steam Governors, and are regarded as *the perfect regulator*. They are manufactured by Messrs. Gorchar & Robertson, practical engineers, who have given many years time exclusively to their manufacture and perfection. The manufacturers say: After an experience of eleven years in the manufacture of the above Governor, during which time several important improvements have been made and two additional patents obtained, we feel justified in recommending it to all parties using Steam power, and warranting it to be the most perfect regulator in the market.



The Gardner Governor is so well known that we think it unnecessary to enter into a detailed explanation of the principles involved, or details in its construction, merely giving the leading objects realized by this important invention. The Governor combines with the greatest simplicity of construction, accurate regulation of speed, POSITIVE INSURANCE AGAINST ALL ACCIDENTS LIABLE TO OCCUR FROM SLIPPING OR PARTING THE GOVERNOR OR DRIVING BELTS, and a convenient arrangement for ADJUSTING THE SPEED OF THE ENGINE WHILE IN MOTION, without change of pullies.

The construction of the Governor is extremely simple, having no springs, inside joints, swivels, or parts liable to disarrangement, all the several parts are duplicates of each other in the same series; the most skillful workmen are employed, the best material used and the machinery employed especially adapted to their manufacture. The valve is most PERFECTLY BALANCED, and the Governor is built with a view of securing the quickest and most sensitive action possibly attainable in a steam regulator. Thus with accurate machinery, and skilled labor, and devoting our WHOLE ATTENTION to the manufacture of THIS ONE ARTICLE, we are able to produce a perfect and reliable Governor at a low price.

We do not publish any letters of recommendations, but can give references to upwards of 5,000 PARTIES THROUGHOUT THE UNITED STATES, who are using the Gardner Governor.

We would especially invite the attention of steam Engine Builders to this Governor, feeling assured that they can purchase for less than they can make an inferior article, and thereby increase the value and sales of their Engines.

We respectfully refer to the following parties using the GARDNER GOVERNOR, and can speak understandingly of its merits: Oakland Cotton Mills, the Selby Lead and Silver Smelting Works, L. & E. Emanuel, Vulcan Iron Works, Fulton Foundry, Levison Bros., Cal. Jewelry Co., Pioneer Woolen Factory, D. A. McDonald & Co., and others in San Francisco; Ophir Co., Lady Bryan, and Sacramento and Meredith Mills, John McCone, Virginia, Nev.; Globe Iron Works, Stockton; A. F. Chury, Albany, Oregon, and many others.

☞ WE WARRANT these Governors to give perfect regulation of speed under all circumstances; and if there is one within one thousand miles of San Francisco, that is not giving perfect satisfaction, it may be returned to us at our expense, and we will exchange it for any other Governor in the country, or refund its price.

☞ When ordering please state whether THROTTLE-VALVE is wanted or not; and whether BLOCK or FINISHED Governor is desired. *.* THE RATE OF SPEED FOR GOVERNOR IS FULLY STAMPED ON THE REVOLVING HEAD OF EVERY GOVERNOR. Send for circular and price list to

TREADWELL & CO.,

Agents for Pacific States, San Francisco.

☞ At Treadwell & Co.'s (late BERRY & PLACE'S) Machinery and Supply Depot may be found in stock the above Governors, together with all sizes of HOADLEY'S PORTABLE ENGINES, BLAKE'S STEAM PUMPS, STURTEVANT BLOWERS, PORTABLE DRILLS, TAPS AND DIES, DREYFUS'S CYLINDER LUBRICATORS, Etc. Also a heavy stock of HARDWARE AND MINING TOOLS, LEATHER BELTING, LINEN HOSE, BOILER FELT (saves 25 per cent. of fuel), SELF-OILERS, LACE LEATHER, STEAM PACKING (all kinds), BELT STUDS, Etc., Etc., embracing every description of Engineers' and Machinists' supplies and Millmen's findings. 7v24-tf

THE GIANT POWDER COMPANY

Are now manufacturing besides the famous regular

GIANT POWDER, A NO. 2 GIANT POWDER,

Somewhat slower in its Explosion, which we recommend for

BANK BLASTING, COAL MINES,

AND FOR ALL SUCH WORK WHERE THE ROCK IS NOT VERY HARD

It is fully as safe as the other and evolves neither smoke nor noxious fumes when exploded.

Price. 50 Cents per Pound.

The sales of both grades increase very fast, which is the best proof of their superiority over other explosives.

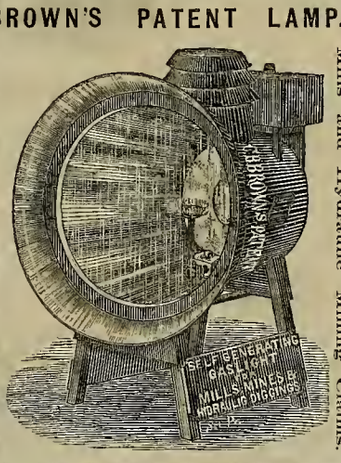
BROWN'S PATENT LAMP.

BROWN'S PATENT LAMP, FOR Mills and Hydraulic Mining Claims.



One of these Lamps, when placed at a distance of 200 feet from the bank, will light up a bank surface 250 feet in length and 100 feet high, and to a much better advantage than any other light heretofore tried, and at an expense not to exceed five cents per hour. Lamps furnished at short notice.

The Vapor of Mercury.

Mercnry is, with the cxception of hromino, the only clement that is fluid at ordinary temperature. It froezes at — 40° and boils at ahont 660° F. For some timo it was supposed to ho non-volatile at ordinary temperaturcs, hnt the experiments of Karston, Brame and othcrs, provo that at even 32° tho volatilization of the metal is perccptihle as well in contact with air as *in vacuo*. This may ho provcd by suspending a gold ring or gold leaf in a flask containing some of the metal, when, after a few weeks it will appear amalgamated. Karsten asserts that at 32° mercury gives off as much vapor as to develop the image on a dagnerreotype plate held over it at a convenient distanco. By the aid of sulphnr in a finely divided condition, as when precipitated from a state of vapor, Brame found that at 53.6° the tension of the vapor rises to the hight of three feet and even higher. He is also of the opinion that in air, and the vapor of sulphur, the vapor of mercury diffuses itself according to the laws which governs other gases.

How to Detect ths Vapor of Mercury in the Atmosphere.

M. Merget has discovered that hy dissolving iridium, palladium, platinum, gold, or silver, in *aqua regia*, a reagent is obtained, which is extremely sensitive to mercnry, and which will, he helieves, prove of great value in solving a numher of practical and theoretical prohlems, among them the hight to which mercnrial vapor rises at ordinary temperatnres. A piece of paper impregnated with the solution, when hronght in contact with mercury or mercnrial vapors, no matter how small an amount or how low the temperature may he, is immediately marked with an indelihle hlack stain. M. Merget expects to he ahle to prove that the vapor which mercury constantly sends forth, ascends to the hight of 1700 metres, at the rate of 180 metres per second.

These experiments are of great practical value to all who are compelled to work in the presence of vapor of mercury, for hy means of these test papers it will he made manifest in all workshops, warehouses and mills where the metal is nsed or stored. The injurions effects consequent upon inhaling the fnmes or vapor into the system are well known, and all chances of doing so should be avoided as far as possible. This metal, like lead, remains in the system and will increase little hy little until it seriously impairs the health. Cases are known where lead when absorhed from water which had flowed through lead pipes, showed its eumulative effects in 25 or 30 years. Mercury will act somewhat in the same manner, and if a workman passes hut one hour a day in atmosphere containing its fumes his clothing, face, hair and heard hecome impregnated with it. By using these prepared papers the workman has hut to touch one and the prcsence of mercury is shown by a well-defined hlack mark. When this happens, means should he taken to keep it closed in flasks properly corked.

Stebins' Hydraulic Elevator.

Among the necessities called into existence by tho reqnirements of modern civilization, aro convenient methods for raising and lowering persons and goods in our high bnildings, so as to save time and muscle. For this purpose steam was formorly nsed, hut rccently water has heen employed as a motive power for this purpose. Although the latter is by far the more economical and convenient power, a difficulty has been experienced in eontriving a machine that would do its work regularly and without leakage. A recent invention hy Mr. Timothy Stehins, seems to embody these advantages with that of simplicity of construction. It consists in the employment of two operating cylinders and pistons, moving in opposite directions, with racks which mesh into opposite sides of a pinion on the shaft of the elevating pulley so that either one or hoth cylinders may he employed as the load may require, and so that when the two are used the strain upon the shaft is reduced to a minimum. The two cylinders are so arranged that one takes water helow tho piston and the other ahove. The piston rods are extended npwards in the form of racks; one of these racks passing np at one side of the shaft and the other upon the opposite side, as shown in *Fig.* 1. The shaft carries the hoistiug pulley and the pinion and the two racks operate upon the opposite sides of the pinion, and thus drive the pulley.

The racks are kept in contact with the pinions by friction wheels hehind them. One cylinder takes the water ahove the piston and therefore has a stuffing hox through which its piston rod passes. The rack is high enough ahove the stuffing-hox to allow the piston to descend to the hottom of the cylinder. The other cylinder which takes its water helow the piston needs no stuffing-hox, hut the rack can he carried down into the cylinder. The water is hronght through a pipe and nnder pressure to the distrihuting valves, and by means of a rope passing around a pulley which operates the valves, and through the platform of the elevator this pulley can he turned to admit the water to one or hoth of the cylinders, or to cut it off altogether hy means of a valve. The lower inside pulley has also a rope passing through the elevator platform and hy this pulley a valve is operated to cut off one cylinder and allow only one to act. When this is done the cylinder which is cut off is allowed to communicate with the air through an opening, so that the vacuum or the condensation of air may not retard its free movement. The upper curved pipe conveys the water to one cylinder, and the lower pipe to the other. Lugs on the pnlleys limit their motion and determiue their position, whether open or closed.

Fig. I.

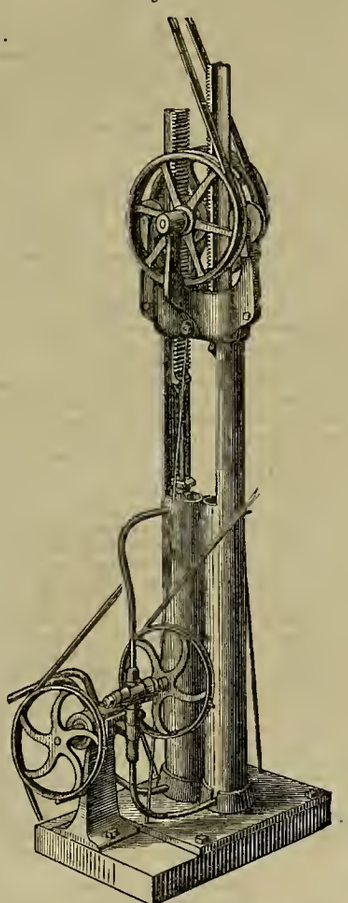

Fig. II.

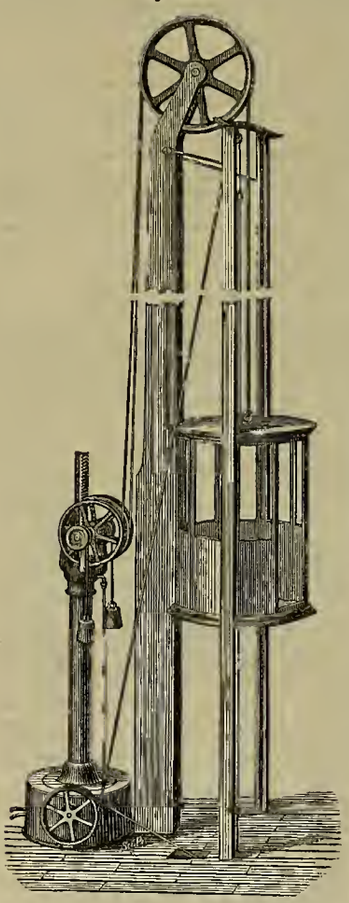

Fig. 1 represents the douhle cylinder apparatus which is calculated to raise 1,000 lbs. on the platform, 30 feet with 42 gallons of water. With light loads one cylinder only need he nsed, and in that case the amount of water required is reduced. Fig. 2 shows the apparatus with but a single cylinder and a cage represented in the act of being hoisted. The heams are represented as hroken to show that the cage and heams are not proportioned in length. This single cylinder uses the same amount of water as when hoth are nsed in the other. The hoisting apparatus may he placed perpendicnlarly as shown, or horizontally, if more convenient, and may be located away from the cage and conneeted with it by gearing. A safety clntch, invented hy the same patentee, is nsed, which grasps the upright heams in case the rope should hreak, and precludes the possihility of accident. The apparatus will he found very convenient in high huildings, where goods have to he hoisted and stored, for hy simply pnlling the rope the cage is raiaed or lowered without manual lahor. Its speed can be regulated at will. For offices in high hnildings it is invaluable, and hy general use second and third story rooms would he even preferahle to those on the street floor on account of heing away from noise and confusion.

The inventor has secured protection for this invention through the SCIENTIFIC PRESS Patent Agency. A working model may he seen at No. 13 Fremont street. For further particulars address Timothy Stebins, San Francisco, Cal.

Beet Sugar Machinery.

On making the necessary inquiry it will he found that a considerahle part of the nice machinery at Alvarado, including centrifugals for the separation of the juice of the heets from the pulp, and the molasses from the crystallized sugars, were made in Germany and imported at large cost. So also of the Sacramento Valley Beet Sugar Company, nearly all of its machinery was imported from Europe, and the mere cost of freight alone, exceeded $10,000. In view of the fact of the undouhted success of hoth of these establishments, we can safely rely upon an additional numher of heet sugaries in California at an early day; and this consummation would he hastened materially if some one or more of our foundry men wonld turn their attention in the direction of supplying what is sure to become a certain want. If our farmers hy association, or onr capitalists, could contract for the requisite machinery, the construction of which would he under their direct supervision, without heing ohliged to send or make a trip to Europe, to get their orders filled, we should hear more of new sugar factories ahout to he erected than we do now.

ABOUT $50,000,000 are invested in manufacturing in Fall River, Mass.

CORRESPONDENCE.

Our Auriferous Gravel—Mining Low-Grade Gravel.

EDITORS PRESS:—At no time in the history of California has there been more interest directed towards gravel mining in thie State than at the present. In this connection it may be well to state some facts that may be interesting to the general miner, as well as those seeking safe investmente in mining enterprisee.

It is a fact that there are several hundred thousand acres of auriferous gravel deposits in the State of California yet unworked, and in fact unexplored. That these vast deposits are accessible and open to enterprise, and can he made profitable by working systematically, is also a fact. Two questions are suggested: How low-grade gravel can bs worked with profit? And 2d. What can be taken as a fair average yield of the deep placers or gravel deposits? In answer to the first proposition we can etate facts. Williams & Cox, undsr the euperintendence of G. W. Cox, washed off at Chandlerville, Sierra Co., last year, fiftesn claims of one hundred feet square each, averaging gravel thirty feet in depth; this gives a little over one hundrsd and eixty-six thousand six hundred and sixty-six cubic yards, (166,666). From this wash seventeen thousand dollars ($17,000) was realized.

Expense of water about	$10,00
Expense of labor about	3,000
Net profit	4,000
Total, (omitting fractions)	$17,000

It will be eeen that this gravel yielded only ten cents per cuhic yard, or about one third of a cent per cubic foot. The chance of getting "a color" by washing this quality of ground in a pan would he very doubtful. If any poorer grade gravel has been washed in the State with profit let us hear from it, for it is important to know how poor ground can he profitably washed off. The above washing was done with 800 inchee water, 150 feet pressure, Craig's globe joint-throwing 5½-inch stream, tail-flume four feet wide.

That the average yield of the gravel depoeit will be more thanfifty cente per cuhic yard there can be no doubt. At Smartsville the upper trata to a depth of 130 feet paid about 48 cts. per cubic yard, the eighty feet next helow paid 84 cts. per cuhic yard, while the bottom strata pays much greater. Cherokee Flat, Butte Co., ehows a still much greater yield. Also at San Juan the gravel is said to pay an average of over 60 cte. per yard. At Dutch Flat there is a very extensive deposit of gravel now being opened by capitalists of San Francisco. This deposit is said to carry $1.80 per cubic yard.

It is safe then to assume that with a liberal supply of water our deepest gravel deposits can he profitably washed, off and that no better and safer investment need be sought after.

Much of the water now flowing to the ocean, should be held in reserve in the mountains for eummer use by means of large reservoirs; canals should be constructed to bring forward large quantities of water to mines now lying idle for want of this indiepensable element. The field is a broad one and capital is required.

MINER.

The Carson Mint.

The *Register* of 14th says: Superintendtent Rice, having received his dies from San Francisco, commeneed work in earnest at the mint yesterday. Owing to the detention of his dies from the East, by the blockade on the railroad, he was forced to borrow from the California Mint, in order to enable him to meet the necessitiee of the community who are dependent to a great extent upon this institution for coin for home purpoees. Yesterday was employed in turning ont half dollars at the rate of about seventy pieces a minute, and to-day some $90,000 in gold—twenty-dollar pieces—will be finished and ready for circulation. Altogether the institution is a success, a credit to the State, and reflects honor upon ite present mauagement. Extensive and important improvements are being made in the refining room, which will greatly facilitate in the general workings and economy of that department. From this time forward throughout the spring and eummer, husinese will steadily grow and augment into figures little dreamed of when the institution was firet projected.

Humboldt Mining Region.

A correspondent of the *Bulletin* writes as follows about mining matters in Humboldt county: In proof of the prosperous condition of the mining interest hero, we have the fact that the value of the precious metals produced in Humboldt county the past year approximate a million of dollars, bullion and shipping ores included; the prospect heing that the yield for the current year will donble that amount. This calculation is based on the aesurance that the out-turn of the Arizona mine, much the largest producer in the county, will double that of last year, which reached nearly half a million, and that a corresponding increase may be counted upou from other leading sources of production. As warrant for this opinion we have the further fact that nearly all the older mines are steadily increeing their yisld, while many new ones are being constantly developed to a productive condition, and considerable accessions made to the ore-crushing capacities of the district. The expectation is therefore not extravagant that the yield of the Humboldt minss will come hard upon two million dollars for the next twelve months.

Mills.

There are now thirteon ore-crushing mills in the county, exclusive of the smelting works at Oreana, and the Auhurn mill at Reno, the latter mostly fed hy Humboldt ores. These several works are ahle to dispose of at least 200 tons of ore daily. Supposing them to operate 250 days out of 365, on ores averaging $40 per ton, we have sn annual production of $2,000,000; making no account of ores shipped away, which last year amounted to $150,000. As the above is a very low estimate average of Humboldt ores, our calculation is well within bounde.

The Most Active Mining Localities.

In the Humboldt region are found just now about Unionville, in the Star, Central, Winnemucca and the Bsttle Mountain districts, and in the vicinity of Dun Glen, Rye Patch and Oreana, at each of which places there is one or more mills—Oreana being the site of the smelting works before mentioned. At Unionville there are four mills, three of them belong to the Arizona company, one of the number being supplied with an Aiken furnace is used exclusively for the working of tailinge.

The Arizona Mines,

Situated on the brow of the mountain, a mile and a half above this place, is not only the most thoroughly explored and largely productive, but also so far as appearance goes, the most valuable mine in this section of the country. Though not a massive vein—ranging only from two to five feet in thickness—it is nevertheless exceedingly compact, uniform and shapely, suffering little contraction and but few displacements so far as developments have extended upon it. The predominating ore is a sulphuret mixed with a chloride and much metallic silver. A large proportion of the vein matter is metalliferous, two-thirds of the entire mass being sent to the mill. As a consequence—although a large amount of ore is daily raised—the miue is not being worked in a rapidly exhaustive manner. At the lowest points reached the ledge has an average thicknese of four feet, the milling oree yielding, tailings inclnded, from sixty to eeventy dollare per ton, and those shipped away, from three to eight—averaging ahout five hundred dollars per ton.

The ores from the Arizona are let down a perpendicular distance of nearly a thoueand feet over a tramway laid against the side of the mountain, which slopes at an angle of forty-five degreee. This work, constructed at a cost of $8,000, obviates the necessity of making a circuitons journey to and from the mine by the wagon road formerly in use, and greatly facilitatee the labor of taking up supplies and getting down the ores.

Other Mines and Mining Operations.

Lying on the same ridge and not far from the Arizona are the Inskip and the Henning lodes, both actively worked and well opened up, and affording a considerable quantity of millable with some shipping ore. A little south of this place is the Peru, an early and somewhat noted location, which, with its extensions, gives employment at intervale to a small working force, and is looked upon here as a promising, not to say, already really valuahle property. Proceeding towarde the south we pass successively the Indian and Sacramento into the Relief District, population growing more sparse aud the evidences of active exertion more feeble as we recede from Unionville, the most thrifty and stirring mining locality in Hnmbolt, Sacramento and Indian are old districts, Relief being of more recent formation. In the latter the common blunder seems to have heen committed—that of getting in a mill first and looking out for ore eupplies aftsrwarde; a mistake that is said to have imparted to the name of the district a peculiar fitness from the manner in which parties inveeting there were afterwards relieved of their money. It is contended, however, by those having best opportunity for knowing that there are really good ledges there, the trouble met with arising from a neglect to properly open them.

Traveling eix miles north from this place we arrive in Star Cañon the eite of.

The Sheba Mine.

The mine now occupies a broad and fertile fissure, ie turning out steadily large complements of rich ore, and is likely to justify the high expectations at first entsrtained of it. A small operative force is kept at work on the Sheba, the owners not caring to raiee any large quantity of ore until a suitahle mill is provided for ite reduction. Works of limited capacity were put up last summer for concentrating the ore, hut not snewering a good purpose, they were run only for a short time. The ore now heing extracted is separated into two claesee, the poorer being retained for milling on the ground, and the other shipped to San Francisco for a market. It is of high average grade; that kept back ranging from $50 to $100 per ton, while much of that sent away runs up into the thousands. It is not neceesary that ehipping ores here ehould be assorted so closely now as aforetime to admit of their profitable transportation to market. With railroad carriage a class can be sent off with a good margin for gain which would not have paid cost of hauling on wagons over the deeerts. It ie for this reason that fewer small lote of extremely rich ores make their appearance in San Francisco now than was the case some yeare ago. The owners of the Sheba will put up a first-class mill near their property the coming summer.

There are a number of other claims in and about Star cañon upon which a large amount of exploratory work has bsen done, and some of which promise good results in the future. Upon several of these, operations, for a long time suspended, have been renewed eince the Sheba strike, and Star City, now nearly deserted, is likely eoon to become a stirring camp once more.

Rye Patch and Oreana.

The mill at Rye Patch, burnt down last fall, hae since been rebuilt, and ie now running 15 stamps, having capacity for 5 more, hereafter to be added. The destruction of the old mill proved a great detriment to the mining intereet in the neighborhood, bringing operatione, which had beoome quite thrifty, for the time being to a stand still. With the etarting up of the new works business has revived and thinge again look cheerful about Rye Patch.

The mill and smelting works at Oreana, built eeveral yeare ago, but which have never as yet accomplished much—halting now, and then getting on with a hobbling gait—having lately passed into more competent, or, at least more fortunate hande, have been put in an efficient condition, and are likely hereafter to fnlfill another purpose than that of drawing drafte on San Francisco to keep them going. Considerable ehipments of bullion are now being made, whioh the proprietore believe they can keep up and eomewhat increase. The mill is rnn chiefly on ores from the Montezuma, Brazil, and other mines in the Arabia Dietrict, cloee at hand.

In and About Dun Glen.

Across the broad valley lying east of here, towers a broken and timherless range of mountains. Along its slopes toward the north were organized eeveral mining districts in the early days. The mineral indications abounding there, enticed many silver huntere into that region. They toiled diligently but their rewards came slow, or more often failed altogether. Like the buried treasure of the money diggers, the coveted deposite, though apparently close at hand, some how or other, always eluded their grasp. And thus they etruggled on, the conteet being long and of dubious issue. One set of prospectors was succeeded by another, the conntry now being thronged with adventurers and again quite deserted. Glowing reports would emanate from that quarter, to be followed soon after by othere equally doleful. The history of these districts brought to mind the grim etories told of people buried in a trance and afterwards by some strange accident released from entombment. This industry seemed to be laid out and, as we thought, pretty effectually buried, when next would he heard a kicking over there, with accounts of a mining spectre stalking about. If what we eee now is really a ghost, it is indeed a sturdy one, ae things have a decidedly life-like look in that eection at presant.

Paut Process.

At Dun Glen a mill has been bnilt, and ie running with a succees not heretofore achieved in those monntaine, the favorable results attained being largely due to the employment of the Paul Electro Amalgamating Process, which is accomplishing real wonders. Nothing directed to effecting the ends especially proposed to be secured by this proeees—the speedy, thorough and economical separation of the precious metals from base combinations—hae yet done its work so well. As this invention is particularly well euited to the treatment of Humholdt ore, is portable and inexpensive, it will probably soon be introduced into general use in this region.

The principal mines now being worked in and about Dun Glsn, the centre of greatest activity in the East Range, are the Tallulah, formerly under the superintendence of the lamented James A. Banks, now extensively opened and fast developing into a valuable property; the Lang Syne, affording ores for the new mill, the Peabody, the Cumbsrland, and a few others of lees distinction.

Central, Winnemucca and Battle Mountain Distcs

In the Central Dietrict, lying eeven milee north of the railroad, opposite Raspberry Station, there are some twenty or thirty mines working away quite independent of capitalists and folk of that ilk. These men mostly own in the claims they are prospecting from which enough ore is extracted in process of development to defray all expenses. They generally explore their lodee by means of ehafts carried down in the vein-matter, nearly all of which affords more or less ore. Selecting from this ore a emall portion of the beet, it is sent over the railroad to Reno and San Francisco for eale, netting them from three to five hundred dollars per ton. There is talk of a mill going up on the river, near these mines, in the spring.

In Winnemucca Dietrict, occupying the southerly face of a high, isolated mountain, ten milee east of Ceutral District, there ie about the same amount of population ae in the latter, the miners conducting affaire much after the same style in both. There is a five-etamp mill here, the capacity of which is eoon to he douhled, with a roasting furnace or a Paul Amalgamator added, the oree in thie section, a mixture of eulphides, chlorides and galena with often a sprinkling of free gold euperadded, rendering eome such couree of treatment neceesary.

Iu the Galena and Battle Mountain Districts, eituate in the eastern part of the county, mining ie prosperous; large quantitiee of argentiferous galena and copper ore, with a considerable amount of silver bullion, eilver-lead, bars, being shipped from that neighborhood continually. In the Pueblo District, lying in the extreme northweetern corner and also in various other parte of the county, mining for silver and copper ie being prosecuted, to a greater or less extent, and with results not in the main differing much from those above mentioned; a glance over the whole country ehowing thie pureuit to be not only moderately progressive but growing all the while more eelf-reliant and eelf-euetaining.

A LUCKY MINER.—We take this item from the Virginia *Enterprise* of February 8th: A miner who was at work in the drift on the 1,400-foot level of the Savage mine when pay ore was etruck got on the eurface before the men working in the drift were corralled, and using what money he himself had and what he could borrow, bought eufficient etock in the mine to clear him $10,000, when he sold out. He has not been back to the mine since.

SOME of the merchants of New York city are of the opinion that more than $3,000,000 worth of lace are annually emuggled into that port, and that the contraband diamonds and other precione stones which arrive there without detection defrsud the Cnstom House of $4,000,000 or $5,000,000 a year. Smuggling is eo lucrative a trade that scoree of families are eupported handsomely by ite proceeds.

THERE are eight pin factories in the United States, the annual production of which is 2,000,000 packs, each pack containing 3,360 pins—a total of $6,720,000,000 pine. About eixteen times thie qnantity is manufactured in England.

MECHANICAL PROGRESS.

Mechanical and Engineering Progress.

The past year has been especially distinguished for advances in mechanical and civil engineering. Among the inventions which deserve special mention, none perhaps rank higher in importance, simplicity, and novelty than the use of the "sand blast" for cutting hard substances. New applications of electricity to regulating large, and actuating small machines have been made. The inventive genius of the country has also been largely exercised in the problem of canal-boat propulsion, stimulated by the offer of a large reward by the New York Legislature. The increased use of artificial stone for various purposes of building and ornament, is also a notable event of the year.

In civil engineering many important works already commenced have been making improved progress, and new projects have been seriously proposed, the accomplishment of which would scarcely have been entertained a few years ago. The mode of attack upon the obstructions to navigation at Hell Gate, near New York, has been entirely changed since the successful operation of Von Schmidt in this harbor, and the most confident anticipations are entertained of complete success in the tunnel operations now in progress there.

The inauguration of the Mt. Cenis Tunnel, which took place in September last, forms an important era in engineering progress, and has brought about a more favorable consideration of the similar work now in progress in the Hoosac Mountains in Western Massachusetts.

The bridges over East river at New York, and the Miesissippi, at St. Louis, are justly regarded as among the most important engineering projects, now in process of completion. Both are making most satisfactory progress, and each presents novel and interesting features in civil engineering.

Our own State has already become widely and most favorably known for the novelty and boldness of its engineering projects, both completed and in contemplation; and the genius and success of California inventors is no less noted and marked, than are the efforts of her engineers in their peculiar and more conspicuous field.

Notwithstanding the wonderful progress of the few years last passed, the field of mechanical progress seems even more inviting than ever in wants and possibilities, while the activity of the year just closed gives good ground for the confident anticipation that the one upon which we have just entered will not fall behind any of its predecessors in important results.

A KNOT TYING MACHINE—Mr A. Perry, of Perth Amboy, New Jersey, has patented a device, which ties a square knot precisely like that made by hand. Those who have had any experience with self-binding mowing machines will at once understand the value of this invention, which, so far as we know, is the only one which accomplishes the feat. It will tie the stringe around the sheaves as they are made by the reaping machine, and thus enable the farmer to dispense with the expense of one man and relieve the team of his weight. The nearest approach previously made to accomplishing tying by machinery consisted, we believe, in twisting the ends of the string or wire together or tucking them under the hand. A reaping machine may now be made to deliver sheaves tied up, which will require as little attention as the mowing-machine—all the work being performed by the machine itself.—*Manufacturer and Builder.*

PHOSPHORUS BRONZE—A NEW METAL FOR DRILLING TOOLS.—A lengthened and exhaustive series of experiments with a new alloy called phosphorus bronze, which is formed by a combination of phosphorus with different proportions of tin and copper, have proved that it is admirably adapted to resisting the concussion and strain incident to heavy ordnance, and also to the manufacture of machinery subjected to excessive strain or violent shocks. Among the numerous purposes to which it may be applied is that of drilling tools. The alloy may also be tempered so as to resist the action of the file. It is claimed to possess elasticity, hardness, tenacity, and durability, far superior to that of the best steel.

Bridge Building.

In no branch of engineering has more progress been made, within the last fifty years, than in bridge building. Bridges are one of the necessities of civilization, and so important were they considered in the "middle ages" that a religous society was founded in the the south of Europe, called "The Brethren of the Bridge," the object of which was to promote intercommunication by constructing bridges over large streams, and establishing ferries where bridges were impracticable. The famous bridge at Avegnon, in France, which was 12 years in building, was constructed under the direction of this institution, about the year 1180. The bridge of Lyons which rested on 20 arches, was also built by them, and in fact nearly all the principal bridges of Europe for several hundred years.

The earliest bridge of note, mentioned in history, was that built by Queen Nitocris over the Euphrates at Babylon. Its length was about 3,500 feet. It was built upon piers—the arch being then unknown. From that time to the present, bridge building has been considered one of the most important arts, and successful constructors have ever been especially honored.

The most wonderful among modern bridges, already completed or now in progress, may be alluded to as follows: The bridge now in process of erection across the Mississippi at St. Louis, which is one of the wonders of the age, is to be a tubular, cast steel, arch bridge, supported by the abutment and two piers, the latter 515 feet apart, and 499 ft. each from its nearest abutment, making three spans of about 500 feet each. Its greatest span is the same as that of the Kullenberg bridge over the Leck, an arm of the Rhine, in Holland.

Telford's suspension bridge across the Mensi Straits has a span of 570 feet.

The Victoria tubular iron bridge of Montreal exceeds this greatly in length, being 5,600 feet (1¼ miles), but it rests upon twenty-four piers, and its spans are mainly only 275 feet.

The suspension bridge at Niagara spans 821 feet, and is 245 feet above the water.

The East River bridge will span 1,600 feet, at a hight midway of 130 feet.

The peculiarly isolated position of San Francisco, must at no very remote period, call imperatively for the construction of a bridge, which will rank among the most wonderful structures of the kind in the world. A bridge across the flats to Alameda, presents no engineering difficulties; but although such a structure will become a matter of necessity, at no very distant day it will come far short of meeting the wants of the future metropolis of the Pacific. The individual is or soon will be born who will be called upon to construct a track for the locomotive across the Golden Gate, and high above the masts of the tallest ship, to form a pathway for the immense commerce which will ere long be seeking this city from the immense region of country between here and Alaska.

NOVEL METHOD OF WARMING RAILWAY CARS.—The introduction of a new method for warming railway cars on some of the French and German lines, has been attended with gratifying success. A preparation of wood charcoal, nitrate of potash and starch is employed. At first the charcoal was burnt in perforated boxes two feet long, four and one-half inches wide, and two and three-fourths inches deep. It was soon found, however, that this combustion caused violent headaches, and the charcoal was, therefore, put into close iron boxes placed under the seats, a double top being employed to prevent the seats of the cars from becoming too warm. The prepared charcoal is placed in the boxes in pieces four inches long, three inches wide, and two inches thick. On the line between Aix-la-Chapelle and Berlin, eight pieces of charcoal were used for heating a compartment. This quantity sufficiently warmed the car during sixteen hours, and at the end of the journey the fuel was still red hot. This prepared charcoal costs thirty-two shillings per hundred, and the expense of heating one compartment is said to be much less than that required by any of the ordinary methods employed, being less than a penny an hour.

HEAVY HYDRAULIC MACHINERY.—At the Empire Foundry, in Marysville, they are manufacturing some hydraulic machinery that will stand a pressure of 504 feet fall. The *Appeal* remarks that this is the heaviest pressure for which machinery was ever made.

SCIENTIFIC PROGRESS.

Facts with Regard to Storms.

A vast amount of information is constantly being gathered and collated by the U. S. Signal Service, out of which is being gradually built up the true science of that class of meteorological phenomena. Among the general observations thus far noted, may be mentioned the following:—

Storms are accompanied with a depression of the barometer near the central line of the storm, and a rise of the barometer in the front and rear.

This central line of minimum pressure is generally of a great length from north to south, and moves side foremost toward the east.

This line is sometimes nearly straight, but generally curved, and most frequently with its convex side toward the east.

The velocity of this line is such that it travels from the Mississippi to the Connecticut river in about twenty-four hours, and from the Connecticut to St. John, Newfoundland, in nearly the same time, or about thirty-six miles an hour.

When the barometer falls suddenly in the western part of New England, it rises at the same time in the valley of the Mississippi, and also at St. John, Newfoundland.

In great storms the wind for several hundred miles on both sides of the line of minimum pressure blows toward that line directly or obliquely.

The force of the wind is in proportion to the suddenness and greatness of the depression of the barometer.

In all great and sudden depressions of the barometer there is much rain or snow; and in all sudden great rains or snows there is a great depression of the barometer near the center of the storm, and rise beyond its borders.

Many storms are of great and unknown length from north to south, reaching beyond our observers on the Gulf of Mexico and on the northern lakes, while their east and west diameter is comparatively small. The storms therefore *move side foremost.*

Most storms commence in the "far west," beyond our most western observers, but some commence in the United States.

When a storm commences in the United States the line of minimum pressure does not come from the "far west," but commences with the storm, and travels with it toward the eastward.

There is generally a lull of wind at the line of minimum pressure, and sometimes a calm.

When this line of minimum pressure passes an observer toward the east, the wind generally soon changes to the west, and the barometer begins to rise.

There is generally but little wind near the line of maximum pressure, and on each side of that line the winds are irregular, but tend outward from that line.

The fluctuations of the barometer are generally greater in the northern than in the southern parts of the United States.

The fluctuations of the barometer are generally greater in the eastern than in the western part of the United States.

In the northern parts of the United States the wind generally in great storms sets in from the north of east and terminates from the north of west.

In the southern parts of the United States the wind generally sets in from the south of east and terminates from the south of west.

During the passage of storms the wind generally changes from the eastward to the westward by the south, especially in the southern parts of the United States.

The northern part of the storm generally travels more rapidly toward the east than the southern part.

During the high barometer of the day preceding the storm it is generally clear and mild in temperature, especially if very cold.

The temperature generally falls suddenly on the passage of the center of great storms, so that sometimes, when a storm is in the middle of the United States, the lowest temperature of the month will be in the west on the same day that the highest temperature is in the east.

The first of the principles upon which the Signal Corps proceeds is that the invariable course of air currents is such as will equalize the atmospheric pressure upon the earth's surface, and that wherever inequalities exist, the winds are set in motion, the air thus finding its level, just as water or any other visible fluid does.

A Volcano in Miniature.

Dr. F. V. Hochstetter furnishes an interesting account of a phenomenon occurring during one of the phases of a manufacturing operation, which is, he says, a complete duplicate, upon a miniature scale, of a volcanic eruption, and which serves at the same time to confirm the modern views concerning the process of an eruption; according to which the lava is not simply in a molten condition, but is reduced to the state of liquidity by the action of the superheated water-vapor under great pressure.

The phenomenon referred to occurs in the operation of separating the sulphur from the residual products obtained in the manufacture of soda by Leblanc's process. The sulphur obtained from these residues, in order to free it from the gypsum, or sulphate of lime mixed with it, is melted in a suitable apparatus, with steam under a pressure of from 2 to 3 atmospheres. The gypsum remains suspended in the water, and the fused sulphur is from time to time run off into wooden troughs, the temperature of the fluid mass being about 251·6°F. Almost instantly after the pouring a crust of solid sulphur is formed on the surface of the mass. Dotted over this surface, however, orifices are left, from which the liquid beneath is forced up. At intervals a jet of sulphur bubbles out, and cooling, forms around the orifice a slight prominence; the repeated eruptions accumulate material about it, until a miniature volcanic cone is formed, with its crater well defined.

The cause of this curious phenomenon is found in the fact that the sulphur, in its fused condition in the steam-chamber, takes up and retains a certain quantity of water, which, as the sulphur solidifies, is given out gradually in the form of steam, accumulating pressure beneath the crust, and forces, at regular intervals, an outlet at the vents, carrying with it in its passage the molten sulphur to form the solid cone. —*Neues Jahrbuch fur Mineralogie.*

Hight and Velocity of Meteors.

A table showing the hight of sixteen shooting stars doubly observed in England, during the meteoric shower of August, 1870, independently of the careful observations recorded at the Greenwich Observatory, appears in the last report of the British Association of Science. A comparison of the observations made at Greenwich on that occasion with those recorded in other stations enables the paths of thirteen meteors, ten of which are new to the former list, to be determined; the hights and velocities of the meteors thus identified are presented in this report. The result shows that the average hight of sixteen meteors, referred to in the last report, was seventy-two miles at first appearance, and forty-eight miles at disappearance; of thirteen meteors given in the present list, seventy-two miles at first appearance, and fifty-four at disappearance; of twenty meteors observed in August, 1863, eighty-two miles at first appearance, and fifty-eight at disappearance. Thus it appears that the present average hights are somewhat less than those observed in 1863; but they agree more closely with the general average hight at first appearance, viz.: seventy miles, and that at disappearance, viz.: fifty-four miles. The average velocity of the Perseids relative to the earth, observed in 1863, was thirty-four miles per second, and that of the three Perseids to the present list was thirty-seven miles per second; while the velocity obtained from the cosmical theory was thirty-eight miles per second.

A NEW EXPERIMENT IN GAS.—A patent gas company has just been formed in England, with a capital of $250,000 in $5 shares, which proposes to distil gas at a low temperature instead of a high one, as on the present system. By this means it is possible to use iron retorts instead of retorts of clay, at a great saving of expense, while the gas produced from the same coal is 30 per cent. more in quantity than the gas produced by previous methods, and the remaining products are also more valuable. There is said to be little or no sulphur in this new and cheaper gas.

Such is the account of this invention which has been privately making way, the latest facts coming out regarding it being that a French company has bought the privilege of using the patent in France for $500,000, and that works are being erected for lighting the town of Barnet, England, with gas at an earlier date, which will supply an experiment on the largest scale.

MINING SUMMARY.

THE following information is condensed mostly from journals published in the interior, in close proximity to the mines mentioned.

California.

ALPINE COUNTY.

MT. BULLION.—Monitor *Miner*, Feh. 10: This tunnel, upon which work has for some time suspended, has heen cleaned out, and work will he resumed so soon as the air will permit.

THE furnace for chloridizing ores at the Monitor mill, after several unsuccessful trials, has again started up and is a perfect success.

RICH ORE is said to have heen already struck in the Acacia tunnel up Scandinavian cañon.

GLOBE MINE.—Alpine *Chronicle*, Feh. 10: Fifty-four ft. were run last month, hy one shift, and last week some good ore, resembling that of the Tarshish, was struck. The hoisting works will he started up and work resumed on the shaft so soon as funds now on the way arrive.

EXOHEQUER.—Last week another body of good ore was struck.

RUBY SILVER has at several times heen found in the different mines upon the Tarshish lode and yesterday we were shown some from the deepest point and one farthest west of any reached therein.

AMADOR COUNTY.

ENOOURAGING. — Amador *Ledger*, Feh. 17: From preparations being made to commence work in the spring on a numher of partially prospected quartz ledges, we may expect not only an increase of business hut the employment of large additional capital. From our mines throughout the county ws hear the most encouraging accounts. Our developed quartz lodes never looked more promising, or yielded fairer returns on capital invested, and everything hids fair to stamp 1872 as a prosperous yesr to the quartz interests of the county.

STATE OF MAINE MINE.—This mine is near the Mokelumne river, ahout four miles southeast of Jackson. The main shaft is down 50 ft. with a contract for sinking 100 ft. further. The company intend to erect a suhstantial mill and machinery necessary for working ths mine, to he driven hy water power. The ledge in the shaft is full 3 ft. and increases in width, the deeper it is sunk upon; the quartz taken out in sinking has been thoroughly tested hy arasta and mill process, and the entire rock hetween the walls without grading, has averaged $16 per ton. The mill will he erected near the main shaft.

MARKLEE MINE.—This mine is about 4 miles northeast of Volcano. At 300 ft. the ledge was 4 ft. in thickness, with the rock well charged with gold and sulphurets. The shaft is down 400 ft. at which depth the ledge has increased to 10 ft., and the entire body of rock will yield over $15 per ton by mill processs.

AMADOR CITY.—Cor. same: The Keystone is pounding away, the rock heing as rich as ever. Last mouth their "clean up" amounted to over $60,000.

THE Original Amador Mill has not, as yet, started up, but the carpenters are busy, and the whole work is fast approaching completion.

CALAVERAS COUNTY.

GARNET GRAVEL CLAIM.—Calaveras *Citizen*, Feb. 10: Garnet claim in this place is a perfect success. They are working 18 men and cleaned up 45 oz. of gold in 11 days run. They netted $250 ovsr expenses.

ANGELS.—Cor. same: The Angels M. Co. are developing their lead by taking rock from the 500-ft. level. Thsy are also taking pay rock from the winze in the 400-ft level. The main shaft is 617 ft. deep. The employés number 60 in all.

The Stickles mine, which is supplied with steam hoisting works, will have their shaft timhered next week. This shaft is 225 ft. desp, and they contemplate sinking it down to the 300. ft lsvel immediatsly. This mine employs about 20 men.

The California M. Co. are tunneling the hill sonth of Angel's creek. This tunnel extends 150 ft. into the hill, with flattering prospects of "striking the lead," which is thought to he a continuation of the one in the Stickles mine.

Mattison is taking out rich rock from the street, directly in front of his shop.

Other Cos. are prospecting with good success.

GOOD ROOK—Calaveras *Chronicle*, Feh. 17: MINE BONDED.—Dr. Hepburn recently made an assay of some quartz from he mine of Sheriff Thoru, near San Andreas. The rock showed very rich, yielding at the rate of $133 per ton. A shaft has been sunk on the lead 150 ft., developing a well defined ledge 5 ft. in width. The prospects that the mine is a permanent and valuable one are very flattering. We learn that it has heen honded to some parties for 60 days, for $80,000. In the meantime a level will he run from the hottom of the shaft which will prohahly result in still more favorable developments.

EL DORADO COUNTY.

DIAMOND SPRINGS.—Placerville *Republican*, Feh. 15: A few days since we saw some specimens of quartz taken out of a ledge in Diamond Springs dist. The richest specimen was nearly one half gold, and the poorest would go ahout $50 to the ton.

GEORGETOWN.—Cor. same: At Greenwood, Nagle and others have taken out over half a million from one claim. They mine the entire hill from summit to hase, it all heing equally rich. Whiteside, Stone, Watson, and others, have reaped an equally golden harvest. Capt. Blaisdell, and 2 other Cos. from San José, are opening some claims on the ridge, and have some very flattering prospects. The only serious drawhack is the scaroity of water, for prospecting purposes.

There is but one ditch hringing water on this divide, and that carries hut a limited snpply.

The quartz minsrs are husy opening np new ledges, and working their claims.

The owners of the St. Lawrence mine have lately put up a mill on their mine at an expense of over $50,000. The mine has heen fully developed; they have a very deep shaft sunk on thsir ledge. Its width is from 4 to 6 ft, aud every pound of quartz contains gold.

The Eureka mine has a very good mill upon it.

GREEN VALLEY.—Placerville *Democrat*, Feh. 17: The claim of Lutz, Chambers & Co., was robhed on Friday of last week. They had been ground-sluicing for ahont 3 months and had intended cleaning hedrock in a few days. The Co. put their loss at from $800 to $1,000. No clue.

LOGTOWN.—The Pocahontas mill closed, hut it will remain idle only a short time. The new shaft is to a depth of 340 ft. The drift north from this shaft is now 250 ft. and verging on a chimney of good ore.

INYO COUNTY.

STRIKE.—Inyo *Independent*, Feh. 10: A magnificent hody of ore has heen struck on a cross lode in the Omega tunnel, 150 ft. below the level of the tunnel, and 450 ft. from the surface. This cross lode is about 20 ft. in width, mostly hard ore running near $200 per ton. The indications are very favorahle for a big strike in the main tunnel.

MARIPOSA COUNTY.

FRANCIS MINE.—Mariposa *Gazette*, Feh. 16: The Co. intend erecting a 60-stamp mill during the season. The prospects of the mine are very encouraging.

IN LUCK.—A Frenchman picked up a piece of gold at Mormon Bar, on Sunday last, which weighed 68 ozs.

NEVADA COUNTY.

THE GOLD YIELD.—Grass Valley *Republican*, Feb. 16: From the best sources of information we can obtain, the yield of gold in Nevada county for the past 2 years has been $5,000,000 per annum.

BRICK.—We saw a brick on the 10th inst. at A. Delano's banking honse worth $6,500, the result of a recent clean up at the Empire mine.

SLUICES ROBBED.—The gravel claims of P. Donovan, at Allison Ranch, or rather the sluice hoxes in his claims, were cleaned up and the boxes demolished on Wednesday night, the 14th inst.

LOCATION. — McCook, Sanford & Co. have located 2,100 ft. on a quartz ledge on Independence Hill, near Deadman's Flat.

BLOOMFIELD.—Nevada *Transcript*, Feh. 13: The North Bloomfield G. M. Co. is carrying on extensive operations. The ditch from Big Cañon Creek is running to its full capacity, 3,000 inches of water. The Co. employ 35 men and is running night and day.

Brockmeyer & Hanner have just commenced washing in their claims at Colorado Hill. They have good prospects.

LOCATION.—The Sligo M. Co. has located 1,700 ft. on the Wasson ledge, commencing at the northwest end of the New England Co.'s claim, in Nevada township.

NEVADA QUARTZ MINE.—The incline is down 125 ft. and is 12 to 14 ft. between the walls of the ledge. The rock is rich in sulphurets and gold.

PROVIDENCE MINE.—National *Gazette*, Feh. 17: This mine is progressing finely. A contract for sinking the incline 80 ft., has heen let and sinking is going on night and day. The incline is down ahout 140 ft., and with the additional 80 that is heing sunk will make the depth 220 ft. The ledge is ahout 3 ft. in width and looks splendidly. Machinery for hoisting works are on the ground, and the works are being erected rapidly.

BUNKER HILL MINE.—A ledge of 15 ft. in width has shown itsslf, and the further they sink the wider the ledge hecomes. On Thursday the mill started up again. Ahout 50 msn are employed in mine and mill.

HOME CO.'S MINE—The Home Co.'s mine, at the mouth of Woods Ravine, lying idle for some time, will start up on the first of March.

TREMONT MINE.—The Tremont is on Deer Cresk, ahout a mile and a half from Nevada City. There are 3 tunnels run on the ledge, the lower one being about 6 ft. ahove high water mark of Deer Creek. This tuunel is heing opened hy contract, and will he completed in ahout two weeks.

PLACER COUNTY.

RIOH STRIKE.—Auhurn *Herald*, Feh. 17: On Monday, T. P. Harrison opened a quartz ledge some 2 miles west of here, which is astonishingly rich in free coarse gold. The ledge is on a high, hold, rocky ridge—the first ridge north of the old Union quartz mill. On Tuesday Mr. Harrison showed us 4 or 5 pounds of the quartz, which was full of coarse, hright, pure gold, amounting to fully $8 or $10 to the ℔. He had out then about one ton, all showing very rich in free gold.

GOOD.—J. Barron has taken out during the past month from the old Barron & Co.'s claims, $421 in gold. This was done by one man, from rock near the surfacs and only a hand mortsr to crush the rock in. The Co. have 1,000 ft. of the ledge, which is from 2 to 3 ft. thick, with slate formation on the east and granite on the west, and is well and clearly defined.

RIOH CLEAN UP—The Bellevue mine has commencsd crushing ore from the dump, at the St. Patrick mill. The first 3 day's run, 15-stamp mill, cleaned up 800 ozs. of amalgam, worth $6 per oz., or $4,800 in gold. There were not to exceed 60 tons of ore crushed, which would bring the yield up to $80 per ton. The Co. have on their dump pile some 500 tons of ore, which it is claimed, will not on an average yield less than 60 per ton, or $30,000 for the lot.

EOLIPSE MINE.—The ownsrs of this mine are doing good work and getting good pay. The Co. have out some 90 tons of quartz, from the 90 ft. levsl, which will yield well. Mr. Patterson has leased the old St. Lawrence mill, and has commenced hauling this rock to it to he crushed, intending to save the sulphurets, which are abundant and rich.

PETER WALTER MINE.—This mine has opened into an extremely rich body of ore on the east drift of the bottom level.

DUTOH FLAT.—Cor. same: All the mining Cos. commenced washing ahout one week ago, and some have cleand up, with very favorable results.

The Summit Co., on Plug Ugly Hill, cleaned up hetween $4,000 and $5,000, the result of 25 days' washing.

Columhus Co., on Grass Hill, also had a very good clean up—hetween $2,000 and $3,000—after a run of 24 days.

The Wahkeegan Hydraulic Co. had a clean np hut I cannot say with what success.

Palentag Co. cleaned up from $1,000 to $1,200, and have a good prospect to do hetter next rnn.

The True Blue Co., on Elmore hill, near Alta, have had 2 clesn ups this season, with good results.

The D. F. B. G. Co. are hard at work laying the pipes from the Yuha ditch to their diggings.

PLUMAS COUNTY.

RUMOR.—*Quincy National*, Feh. 10: We are informed that the Crescent mills property has passed into the hands of an English Co., and that an agent is expected soon, to commence work on the mine.

SIERRA COUNTY.

CHANGE. — Downieville *Messenger*, Feh. 10: Wm. Manson has been elected Sup't. of the Highland & Masonic M. Co., at Alleghany.

TRINITY COUNTY.

DOUGLAS CITY.—Cor. Weaverville *Journal*, Feh. 10: Marsh & Green, at Point Bar, cleaned up $171.50 for 12 days' run, two men working.

Marcus Bennett made a partial clean up in his claim on Red Point, above Point Bar, and took out 11 ounces for 10 days' run, no hed-rock heing cleaned. Parties who have visited this claim say the bed-rock is literally covered with gold dust.

Nevada.

ELKO COUNTY.

LUCIN.—Cor. Elko *Independent*, Feh. 17: During the past 2 weeks a new impetus has been given to mining operations in this dist. Several Cos. who had suspended operations have again resumed, and a numher of new Cos. have commenced work with flattering prospects. Work ou the Lucy Emma mine was resumed a few days since, and it is yielding very rich ore. From the Hamhurg mine good paying ore is being hoisted. The shaft is down about 40 ft. hut at that depth it shows well. The Overland is heing prospected in a thorough manner with every indication of soon developing a rich hody of ore. The Big Emma, after changing hands several times, has fallen into the possession of Mr. Banfield, and he is prosscuting work upon the same with energy.

Yesterday the keys of the Tecoma mine were delivered to the original owners, the Independent Co.

EUREKA DISTRICT.

EUREKA CON.—Eureka *Sentinel*, Feh. 11: The hullion flows freely from 4 furnaces, the 5th one remaining idle as a reserve; 20 tons of hullion per day is the average yield.

ELY DISTRICT.

BULLION.—Ely *Record*, Feh. 11: W. F. has shipped since Feb. 8th hullion valued at $60,098.92.

BOWERY MILL.—The grading is all done and the rock work finished in fiue style. The machinery has all arrived and work has commenced. Mr. Heyck the huilder, thinks that the mill will he ready to run hy the 1st of March.

MOCKING BIRD.—This claim is on the side of the mountain about 1,000 ft. east of the Silver Peak shaft. The ledge is large and well defined on the surface, and can be traced for several hundred feet.

Emperor is the name of a recent location on the west side of the Meadow Valley road, about midway between the Bowery and Alps mines. The shaft is down 35 ft. showing walls of a fair character, and ledge matter containing oxides of lead, and traces of silver.

PAGE AND PANAOA.—The whim is completed at the main shaft. Work has heen commenced—timhering the shaft in a suhstantial manner from top to bottom. As soon as the shsft and works are timhered throughout, the main shaft will he sunk 100 ft. deeper, and cross drifts run from the 200-ft. level to the lsdges. The ledge in the shsft at the 152-ft. level is 5 ft. wide, and shows hunches of good ore. The south drift, at a point 140 ft. south of the main shaft, cuts a ledge that is 11 ft. wide and well defined, with psrfect walls, and carrying good ore.

PEA VINE.—This claim is on the Bowery ledge, just west of the Lehigh mine. The ledge was struck in this claim last fall. A shaft was sunk 40 ft., showing all the way down a well defined vein over 18 inches wide that will assay $215 to the ton. The ledge has heen opensd at 3 or 4 points for a distance of 300 ft. in length, showing it to he genuine.

VANDALIA.—A large ledge of fair ore was struck in the cross cut on the 9th inst. The claim is northwest of the Silver Peak and on the eastern slope of Bowery Point.

HAHN AND HUNT CO.—The Supt. has gone below to make arrangements for putting up the necessary buildings and improvements to work the mine to advantage. A full force of men will bs placed at work on the 1st of March. The ledge is ahout 3 ft. wide, of solid ore of a high grade. Present developments show over 600 tons of fine ore, with every indication of an immense mass clear through the mine.

VULTURE.—This is a recent location ahout 400 ft. northwest from the Bowery. At a depth of 5 ft. a body of fine ore was struck, which promises well.

HUMBOLDT.

UNIONVILLE.—Cor. Humboldt *Register*, Feb. 10: The Arizoua Cons. is heing well developed and looks hetter every day. A few days since, a vein 5½ ft. in thickness was found, and proved to be of rich black sulphuret ore, 3½ ft. of which contains good milling ore, and considerable of the remainder is high grade shipping ore. There is a drift at present heing run north from the shaft, at a point 120 ft. down, which also shows a rich vein of 5 ft. in thickness and equals anythiug ever taken out of this mine. The incline which is down 160 ft. also shows very promising. The Eclipse mine is not doing much work, in consequence of the late snow storm. In the course of 2 or 3 weeks they will again commence operations, and hy Aug. next, they will have their mill built. For sometime past they have been driving ahead the wrong way in search of the ledge, and finally struck out in a northerly direc ti on

and struck on a rich vein of black sulphuret ore, about 3 or 4 ft. in thickness. The Inskeep and Henniag are looking well, and have a vein which varies from 2½ to 5 ft. in thickness. The ore assays about $70 per ton. Operations on these mines still continue.

It is rumored that J. C. Fall & Co. are about to erect a $40,000 quartz mill at Star City.

REESE RIVER.

Prospecting Party. — Roose River *Reveille*, Feb. 15: Nick Barovich and Ben Troxel start in a few days on a prospecting tour to the country in the vicinity of Silver Peak.

Will Start Up.—The Manhattan mill will resume operations to-morrow.

WASHOE.

Belcher Bullion.—Virgina *Enterprise*, Feb. 15: We yesterday saw at the Bank of California 13 bars 1,231 lbs and worth $49,473.29.

Sutro Tunnel.—On the 11th inst. the Tunnel was in 2,726 ft. Ground hard—no water at the face of the tunnel. Shaft No. 1 down 93 ft.; ground good. No. 2 down 150 ft. in favorable ground—some water. No. 3 down 90 ft., ground hard and dry. No. 4 down 92 ft., and the ground is hard and very wet. On the 12th a great body of water was tapped in shaft No. 4.

Crown Point.—Last week the amount of ore extracted and shipped to mills was 655 tons, valued at $32,143.60.

Late accounts from the Savage are to the effect that the new development is not looking as well as at first.

Vivian Mill.—The damages to the dam and race of the Vivian mill, on Carson river, by the winter floods, are being repaired, and the mill will be able to start into operation again at an early date.

The Yellow Jacket mill, Carson river, is being thoroughly overhauled and will start up the first of next month as good as new.

The majority of our reduction works are in full blast with plenty of ore and an abundance of water.

Belcher.—During the last month, 8,000 tons of ore were sent to mill, valued at $410,000. The mine continues looking and yielding splendidly.

Started Up.—Gold Hill *News*, Feb. 14: The first of the 2 powerful hoisting engines at the Crown Point works, having been put in working position, was started on Tuesday. It works splendidly. The other one will also be put in position as soon as possible.

Items.—The stopes and north wiuze at the 1,100-ft. level of the Belcher are looking and yielding splendidly, car samples assaying about $80 per ton; pulp assays average $68. The average assays from the drift and east cross-cut at the 1,200-ft. level of the Crown Point are from $50 to $260 per ton and from the winze at the 900-ft. level, $30. The Chollar Potosi is yielding about 150 tons of ore per day, and $50 per ton is about the average assay of car samples. The Hale and Norcross yields about 125 tons per day.

WHITE PINE.

Eberhardt.—White Pine *News*, Feb. 10: There is a shift of men engaged cleaning out the Keystone tunnel.

Ward Beecher.—The winze to connect with the Lady's chamber shows a fine body of ore.

Noonday.—Breasting out with a force of 5 men.

East Shenoyoan.—Working a force of 10 men, in the southeast drift, Exchange Incline, and Regent drift. The Exchange Incline and Regent drift are now connected. There is a rumor that 400 ft. of the Co's. ground was jumped a few days ago.

Asbury Tunnel.—Work in the tunnel and side drifts go ahead as usual. The indications for a strike of mineral are more favorable than when last reported.

Shafer.—The shaft is down 197 ft., and shows ledge matter from bottom to top.

Edoar.—Arrangements will be made for extensive operations.

Copper Glance.—A force of 2 men is employed sinking the main north shaft.

Silver Wave.—The new shaft is down 35 ft., and shows a fine body of fair milling ore. Work in the different shafts progressing as usual.

San Juan del Rio.—There is a fine body of ore in sight. The Sup't. will commence shipping ore to mill soon.

North Aurora.—The south drift from the Lady's chamber has improved in body and grade since we last visited the mine.

South Aurora.—Drifting back to the spar seam to the Mitchell shaft. A contract is let to drift east from the main tunnel.

Gen. Lee.—The drift from the spar scam is going ahead as usual and showing a body of ore 3 ft. in width.

Outside Districts — Robinson. — The shaft on the Osborne is down 60 ft. The level from the bottom of the shaft is in 70 ft., showing a fine body of oxide of copper. The Hays, Brooks, Emma, and Silver Star, show copper, silver glance, and milling ore. The Old English and other prominent mines are looking well.

Arizona.

Mines and Mining.—Prescott *Miner*, Feb. 3: For the present, A. Rush has suspended operations at Poople's Valley. The Vulture, Tiger, Lorena, Del Pasco, Benjamin and other Companies are working away.

Pinal Mines.—Tucson *Citizen*, Feb. 3: Work on the Silver Queen is going on; ledge seven ft. wide and solid mineral.

Idaho.

Bullion.—Silver City *Avalanche*, Feb. 10: W. F. & Co. shipped from here this week 6 bars valued at $15,066.53.

South Mountain—Cor. same: E. C. Hardy, of Boise City, is about to bond, or has bonded the extension of the Mono. Ben. Cook has resumed work on the Bay State, which shows a solid mass of very rich galena 5 ft. in thickness, traced a distance of 100 ft. E. B. Johnson has made arrangements to begin work on the Mammoth next week. The May Queen shaft is down 26 ft. and the ore looks fine. Hastings & Co. are running a tunnel to tap the Hastings ledge 25 ft. below the surface. They are in 30 ft. and expect to tap the ledge in 5 ft. more. The Polar Star has increased from the thickness of a knife blade to 3 ft. and that at a depth of 10 ft. with very rich ore. The Co. have started a tuunel in the gulch to tap the vein 30 ft. below the surface.

Montana.

Clancy Creek.—Helena *Gazette*, Feb. 5: Out of the El Dorado, the Co. are taking 7 tons of galena every 24 honrs, and will soon have their mine in shape to take out double that amount. On account of bad weather the Minnesota mine has closed, but will start up again as soon as the weather moderates. Halford & Co., Dr. Brook & Co., and Parker & Wood are at work running tunnels to their respective lodes.

There are several parties running tunnels, and all think they have a "dead thing" on a good lode.

Beartown.—Deer Lodge *Independent*, Feb. 10: Some 30 men are working and taking out money. Abont 10 Cos. are at work on the lower gulch taking out pay dirt.

Prospectors.—A party of prospectors are going out the coming week to prospect the tributary of Mill Creek, heading in the direction of French gulch.

Utah.

Camp Floyd.—The Queen of the West, Sparrow Hawk, Silver Cloud and a number of others have a large amonnt of valuable ore in their shafts. There are some 250 men at work in the Dist. for good wages. The mill being erected by the Sparrow Hawk Co. will be completed within the next 6 weeks.

Little Cottonwood.—Work continues in several of the mines and some miners are trying to develop their claims, notwithstanding the inclemency of the weather, and are making rich discoveries. A. Jacobson brought into Alta yesterday, a very rich and large specimen, weighing 140 lbs., taken from the "Matilda," near the Davenport.

Tintic.—More recent mining discoveries are reported in this Dist., assaying very favorable and showing large deposits.

A party just in from West Tintic, where they have been sinking on the Noon lode, are quite elated. They claim to have a strong, clearly defined vein of good milling quartz, 6 ft. in width.

Columbia Dist.—Gold Eagle is lying idle, but the Co. intend to commence work next week with 2 shifts.

Chimney Corner, on Montezuma Hill, is proving itself one of the best mines in the Dist. Holmes & Gillham have run their tunnel 50 ft., following their ledge from the surface, and now from the face of the tunnel, or incline, more properly (for it has pitched to the south about 4 ft. in running the 50) it is about 45 ft., vertically. The ledge is 3¼ or 4 ft. wide and is pitching to the south very rapidly. The ore is very soft and porous, being carbonates of rich character, with the exception of 3 or 4 inches of galena which lies next to the hanging wall. The hanging wall is smooth and true, not varying 3 inches in the whole length of the tunnel.

The Washington is being worked and prospects finely at a depth of 25 ft., showing the width of the whole shaft. The ore in this mine is improving as depth is attained.

Domiago, on the same hill and east of the Washington, is down 12 ft. on an incline and looks very promising.

Liberals, still further to the east, are in on their tunnel 20 ft., showing good ore but the ledge is still broken.

Prospectors are begining to come in.

S. F. Stock Exchange Board.

San Francisco, February 22, 1872.

There was no session of the Stock Board today, it being the anniversary of Washington's Birthday. The sales at the Board for the past few weeks have been larger than ever before since its organization. The sales for the week ending Jan. 24, were $4,540,200; week ending Jan. 31, $4,208,600; week ending Feb. 8, $8,045,000; week endiug Feb. 15, $7,682,000, making a total of $24,467,300. The *Bulletin* says that the total amount of sales for 1870 was only $51,186,000 and in 1871, $127,888,000. The magnitnde of these sales is apparent by the latter figures and the amount of sales this year may approximate $175,000,000. On Friday the sales were moderate and prices weak for most kinds of stock. On Satarday they were a trifle higher.

The Page & Panaca S. M. Co. have elected the following Trustees: H. Mayer (President) S. Steinhart, N. C. Fassett, A. H. Rutherford, Geo. D. Roberts and H. Schwartz. L. Kaplan is Secretary.

The Superintendent of the Daney mine writes that the drifts coutain seams of fair ore. During the past week 500 tons of ore were taken from the Belcher, averaging by assay $55 per ton; bullioa shipped, $120,655.

The Justice M. Co. have elected as trustees: G. W. Beaver (President) R. F. Morrou, I. N. Thorne, T. H. Williams. G. W. Wegener was continned as Secretary.

The Eureka mine cleaned up last week 310 onnces of amalgam from 180 tons of ore. The bullion shipment from the Raymond & Ely was $26,464, and from the Piermont mine $8,000. Some 996 tons of ore were taken from the Savage mine; 970 tons from the Hale Norcross, and 150 tons from the North Star. Stocks were rather active again on Tuesday, but prices were weak. About 740 tons of ore from the Crown Point last week yielded $41,000. The clean up of the Golden Chariot mill on the 16th, amounted to about $6,000. On the 17th, $2,500 were sent down from the Original Hidden Treasure mine, and on the 19th, $2,200 from the Buckeye.

Sodium for Blasting.—The application of sodium for the purpose of blasting is made as follows: Two glass bulbs 50 cubic centimeters capacity are blown with a neck of glass between them; one bnlb is filled with sodium and the other with water, and between the two is fused a soluble salt. The length of time required to dissolve the salt can be ascertainod by experiment, and the connecting tube be made so as not to have the charge fired prematurely. The bulbs, with the sodium below, are let down into the drill hole, the water gradually dissolves up the salt, and thus comes into contact with the metal, and the explosion follows.

Leather Market Report.

[Corrected weekly by Dolliver & Bro., No. 109 Post st.]

San Francisco, Thursday, February 22, 1872.

Sole Leather.—The demand is still equal to the supply, and prices still continue firm.

City Tanned Leather, ₱ lb.	26@29
Santa Cruz Leather, ₱ lb.	26@29
Country Leather, ₱ lb.	25@28

The market is well supplied with French stocks, and prices have a downward tendency. Heavy California skins are firm, with an upward tendency.

Nothing New—Telegraph in 1817.

The old adage that "there is nothing new under the sun," is again verified in the case of the electric telegraph. In an old work, entitled "Arthur Yonng's Travels," published in 1793, accurs the following accounnt of what was clearly an approximation to our present system of telegraphic communication:

"In the evening to Mons. Lomand's, a very ingenious and inventive mechanic. In electricity he has made a remarkable discovery. You write two or three words on a paper; he takes it with him into a room, and turns a machine enclosed in a cylindrical case, on the top of which is an electrometer, a small fine pith ball. A wire conects with a similar cylinder and electrometer in a distant apartment, and his wife, by remarking the corresponding motions of the ball, writes down the words they indicate, from which it appears he has formed an alphabet of motions. As the length of the wire makes no difference in the effect, a correspondence might be carried on at any distance; within and without a besieged town, for instance, or for a purpose more worthy and a thousand times more harmless, between two lovers prevented from any better connection. Whatever the use may be, the invention is beautiful.

There are eight pin factories in the United States, the annnal production of which is 2,000,000 packs, each pack containing 3,360 pins—a total of $6,720,000,000 pins. About sixteen times this qnantity is manufactured in England.

The Hunt & Douglas Process for the Extraction of Copper from its Ores.—No. 1.

This new process, for which Letters Patent have been granted in the United States, Great Britain, Canada, Newfoundland and Chili (besides an exclusive privilege for Bolivia) may be understood from the specifications of the British Patent, here given, to which are appended notes and explanations:

Specification.

For the extraction of copper from its ores by this process it should ho in the state of an oxyd or some compound thereof, as oxychlorid or carhonate. These oxydized forms of copper are decomposed under proper conditions by protochlorid of iron with the production of dichlorid of copper, which is soluble in certain saline solutions, and in some cases a portion of protochlorid of copper, together with insoluhle peroxyd of iron, and more or less insoluble oxychlorid or hasic persalt of iron, which may he rendered soluble by the action of sulphurous acid.

The naturally or artificially oxydized ores are to he digested with a watery solution of neutral protochlorid of iron, with or without the addition of an earthy or alkaline chlorid, as common salt. The neutral protochlorid of iron may be conveniently prepared by douhle decomposition of protosulphate of iron with an equivalent of chlorid of calcium or chlorid of sodium. In preparing the solution, hereinafter designated as the bath, we may proceed as follows:

One hundred and twenty (120) pounds of salt, or one hundred and twelve (112) pounds of dry chlorid of calcium, or its equivalent of hydrated chlorid, are to he dissolved with two hundred and eighty (280) pounds of protosulphate of iron (green copperas,) in one hundred (100) imperial gallons of water. In place of the ahove salts we may substitute an amount of protochlorid of iron prepared by any other method, containing fifty-six (56) pounds of metallic iron. To the bath prepared in either way, two hundred (200) pounds of sea salt are then added, when the solution is ready for use, and will be found capable of chloridizing and dissolving about ninety (90) pounds of copper. The power of hrine to dissolve the dichlorid of copper formed increases greatly with the strength and temperature. The proportions above given are convenient, but in the case of poor ores, a solution of one-half the strength may be used with advantage.

In the treatment of copper ores by this process, they may be divided into two classes, non-sulphurretted and sulphuretted ores.

The first class or non-sulphuretted oxydised ores, inclndes [the native oxyds of copper, the carhonates and the oxychlorid. To prepare these for treatment they ehonld be finely pulverized. and the carbonates may with advantage be gently calcined be-before or after grinding, in order to expel carhonic acid. The red oxyd, if alone or greatly predominating, ehould also be gently calcined after grinding to convert it into protoxyd; but if it he mixed with a considerable proportion of protoxydized ore this is not necessary.

The pnlverized oxydized ores thus prepared are to be digested in the above bath, with frequent agitation. Heat is not necessary, but it accelerates the solution of the oxyd of copper, which in practice should not be more than sufficient to yield eixty or seventy pounds of copper to the above bath of one hundred gallons. When the solution is complete and the liquid drawn off, the insoluble residne should be lixiviated with a small volume of hot etrong brine. The liquid is then digested with metallic iron, hy which the copper ie throw down as cement copper, two parts of iron yielding three parts of matallic copper.

The bath thus freed from copper oontains a large amount of regeuerated protochlorid of iron, and can be used at once to treat a fresh portion of oxydized ore. A small loss of chlorine, which separates as oxychlorid of iron, has, however, to be snpplied by adding to the bath, from time to time, protochlorid of iron or the salts required to prodnce it. This need not, however, exceed for each repetition, one-eighth of the original quantity, and by careful exclusion of the air the quantity to be added each time may be reduced to much less. The strength of the bath in protochlorid of iron should be determined from time to time by appropriate tests.

In localities where it may be desirable to economize the protochlorid of iron a modification of the process may be adopted, which consists in treating with snlphurous acid the iron-compounds precipitated hy the oxyd of copper. To this end sulphurous acid from the roasting of sulphuretted ores, or from any other source, may he made to pass over or through the bath after or during the process of dissolving the oxyd of copper. In this case the protosalts of iron are constantly regenerated, and serve to chloridize fresh portions of oxyd of copper. A small amount of protochlorid of iron, with the aid of sulphurons acid, may, in this modification, be used to convert a large quantity of copper into dichlorid, the excess of which is precipitated, and may be washed out with hot strong brine. As this deposits a large quantity in cooling, the same brine may be employed indefinitely for dissolvinig dichlorid by heating and cooling it each time.

The solid dichlorid is rapidly reduced hy contact with metallic iron, especially when wet with brine, and yields metallic copper and protochlorid of iron, one part of iron giving two of copper. To prevent any precipitation of oxychlorid of copper from the dichlorid solution hy the air, it is well in all cases to have a small portion of protosalt of iron present. A little free sulphurous acid will also prevent such precipitation; but any excess of this gas should be expelled or allowed to escape from the solution before adding metallic iron.

In the case of sulphnretted ores, the first step in the application of onr process has for its object to convert the metal into an oxyd soluble in the hath already described. This conversion is effected hy calcination in the air, by which means all copper, iron and sulphur are oxydized. [Pyritous ores, holding much iron and sulphur, may be roasted in kilns, then ground and recalcined, but native sulphurets rich in copper, or regnlus, should be ground before calcination, which is hest done in a muffle furnace.] In either case a low red heat snffices, and what is called a dead roast is to be avoided, not only because it involves a waste of time and fuel, but because the high temperatnre renders a portion of the oxyd of copper insoluhle in the protochlorid of iron bath. The roasting need bo continued only until the complete oxydation of the sulphuret of copper, and its conversion into a mixture of oxyd with a variable proportion of sulphate of copper. This product may he treated directly with the bath, without addition, as directed for non-sulphuretted ores, but the excess of sulphates thus introdnced renders the bath impnre, and much more metallic iron is requircd for the eubsequent precipitation than when the whole of the copper is in the form of oxyd.

We therefore prefer to proceed as follows: We determine in the roasted ore the amount of copper present as snlphate, which will vary little for any given ore roasted under constant conditions, and we add thereto an equivalent of lime, which gives rise to insoluble sulphate of lime and oxyd of copper. In practice it is well to leave nndecomposed a small amount of snlphate of copper, which, in a eubsequent stage of the procese, will give with metallic iron the eulphate of iron required to replace the small loss already mentioned as occurring when sulphurous acid is not used. To an ore, for instance, with eight per cent. of copper, which after roasting contains three per cent. of copper as oxyd, and five per cent. as eulphate, we may add lime enough to decompose four-fifths of the latter at the rate of 28.0 parts of pure lime for 31.7 parts of copper, or about an equal weight of ordinary non-magnesian lime; heing four ponnds of finely ground lime for each one hundred pounds of the ahove roasted ore. An equivalent quantity of carbonate of lime, or other alkaline or earthy base, may be nsed instead of quick-lime, hut with less advantage. The roasted ore and lime may be added to the bath together, or better, the ore is to he added first. The subsequent part of the process is to be conducted as already described for the ores of the firet class.

[To be continued.]

THE recent Swedish and German expeditions to the Arotio region, and their confirmation of Dr. Kane's discovery of the open polar sea, have inclined many British geographers to favor a scheme of exploration by way of Smith's Sound, and some endeavors are being made to induce the Admirality to organize a new expiditiou. The excellent influence of such enterprises upon the naval service, is urged as a powerful argument in their favor.

California Manufactures.

We have received a pamphlet possessing merit, entitled "An Essay on the Manufacturing Interests of California, the Causes that impede and those that would aid in their development." By W. G. Morris, U. S. Marshal, and H. C. Bennet; "and puhlished hy permission of the Mechanics' Institute. If we premise the figures and tahular statements contained therein to he correct, which douhtless they are in the main, it presents a very favorahle showing of the mechanical and manufacturing interests of California.

It gives the number of indnstrial establishments in the State in 1870 as 6,515; hut estimates that of this number fully three-fourths are boot and shoemakers, tailors, hlacksmiths, bakers, carpenters and other hranches of industry usually found in most town and villages. After deducting these and a few other minor industries, the real manufactures of the State are summed up as follows:

List of Manufactures.

Four agricultural implement makers; 1 hagging weaving mill; 6 billiard tahle makers; 5 hoiler makers; 8 boot aud shoe factories; 8 box makers; 13 corn hroom makers; 33 hrick makers; 2 brush makers; 2 candle makers; 21 Carriage and wagon makers; 3 cement pipe makers; 4 chemical works; 75 cigar makers; 2 cordage makers; 1 file cutter; 150 flour mills; 2 glass works; 2 gold heaters; 6 harness factories; 12 hatters; 1 hydraulic cement maker; 6 jewelers and silver plate makers; 1 lead pipe and shot factory; 3 smelting works; 1 linseed oil works; 60 machine shops and iron foundries; 2 metallurgical works; 3 pail and tuh factories; 2 paper mills; 1 piano forte maker; 20 planing mills; 1 powder works; 1 rolling mill; 10 salt makers; 1 saw maker; 22 sash, door and hlind makers; 16 shingle mills; 300 saw mills; 10 ship builders; 10 soap makers; 3 soap root curlers; 1 starch maker; 8 straw hat makers; 1 stone (artificial for building) maker; 2 sugar refineries; 40 tanneries; 50 tinsmiths; 6 trunk makers: 3 type foundries; 3 wire workers; 6 woolen mills.—Total 954.

There are certain industries quite peculiar to this State, among them are the asphaltum mining, petroleum collecting, making horax and sulpher, mining chromic and other ores of iron, and curling soap-root as a substitute for horse-hair. The latter is quite a new industry and employs a capital of nearly $50,000, with 60 men, and machinery and engine of 40-horse power. The value of the product is nearly $100,000 annually, and is steadily increasing, hecause this material is the best substitute for hair ever discovered, and grows in unlimited quantities in all the foothill districts in the State.

The numher of persons employed in manufactures, according to the Federal Census returns, is 36,626 men, 1,253 women and 850 hoys. These figures, if subjected to similar analysis, show that less than 5,000 men, not more than 300 women and only ahout 400 hoys are employed in manufacturing in the whole State. Of the boys employed, 90 per cent. are engaged in the printing husiness.

The capital invested in manufactures, according to the Census, amounted to $76,947,310. If from this amount he taken the capital invested in miniug enterprises and other branches of industry not properly classed as manufactures, the amount employed does not exceed $20,000,000. Estimating the capital employed in each of the above 954 establishments at $20,000, which is far ahove the actual figures, the amount would not reach $20,000,000.

The total population of California is given for 1870 as 560,223. Imports of manufactured goods by sea are set down at $26,504,500. Imports by Central Pacific Railway $5,300,000; total of imports $71,063,688. Exports for the same year, merchandise hy sea $17,840,160. By railway, $2,750,000. Treasure hy sea and railway $32,983,140. Total of exports $53,581,300. If there is no material error in the above estimates and figures, there would seem to he a balance against us of $17,482,388. The pamphlet goes on to show in its way, the causes that operate against the manufacturing interests; the costs to the people of California in maintaining a metallic currency; the effect of savings hanks on the manufacturing interests, how capital control these interests, etc., making a very readable, interesting, and we presume reliahle work.

The Ponsard Furnace.

This furnace, so called after its inventor, and said to he applicable to puddling, steel-making, or any of the other uses to which the Siemens furnace can he applied, has of late been attracting considerable attention in Paris, where, for some months during the siege, an experimental furnace of this construction, was employed in the manufacture of crncible cast steel direct from the ore. The crucibles disposed in two rows along the sides of the furnace are charged from above and outside the furnace, eo as to enable one charge after another to be placed into the crucihle as the preceeding one sinks down in it, and, to some extent, therefore, making the smelting operations continuous. No reliahle details of this experimental working have as yet come to hand, hnt from the description it appears that the furnace is a regenerative one, in certain respects analogous to the Siemens' furnace, thau which it is, however claimed to be at the same time less costly as well as more simple in its action and construction. From the very imperfect description as yet received, it appears that the fuel employed is converted into gas in a generator, from which the gas is drawn by an uptake into the furnace proper. The air necessary for the comhustion of the gases enters the furnace after having heen previously heated in the regenerator, and the hot gaseous products of oombustion escape by the uptake after having first traversed the regenerator, which is composed of a cubical chamber divided into vertical channels, one set of which is devoted to the passage of the hot gases, whilst the other set is being traversed by the atmospheric air which supplies the furnace. Each of these are furnished with partitions to retard the movements of the gas or air circulating through it, and these partitions are constructed of perforated brick, arranged in lozenged fashion, so as to establish oommunication between them, and also increase the heating surface, by which arrangement the apparatus acquires great heating powers in a comparatively small space. The flame can he rendered at will either oxidizing or reducing, and the temperature can he varied by merely regulating the respective currents of air and gas.—*Journal of the Iron and Steel Institute.*

The Raymond & Ely 30-Stamp Mill.

The Ely *Record* gives a description of the new mill of the Raymond & Ely Co. The stone walls upon which the building rests are very substantial, and are put up in a tasteful manner. The arrangement of the mill is the hest of any we ever visited, as the foreman can stand at the main entrance and at one glance view the entire works, excepting the retort room, which stands in the rear. The machinery was manufactured at the iron works of Booth & Co., and is amongst the best of their superior class of work. The machinery weighs 188 tons, or 376,000 pounds. Work was commenced on the building Nov. 16th, 1871, hy J. B White, superintendent of construction.

The building is large and commodious; the engine room is 36x40; the battery room is 56x46; the pan room ie 56x56; the retort room is 56x46 and well ventilated, and is furnished with eix 12-inch retorts. The two boilers are each 16 feet long and 56 inches in diameter, with steam and mud drums of the best pattern attached. The governor ie one of Pickering's hest. The engine is 125-horse power, and can be run at 150-horse power if needed; it has 18-inch bore, with 42-inch stroke. The fly-wheel weighe eight tons. The main driving pulley is seven feet in diameter, and 26-inch face. The platform for receiving ore is 100x60 feet, and floored with 3-inch plank. The ore passes from the platform into one of Blake's largest rock-breakers, which does its work well, reducing the ore to a small size; from this it is thrown into the drying furnace or kiln, which is 60x12 feet, and is constructed in good style and of sufficient capacity to dry all the ore that ie needed for crushing. From the furnace or dry kiln the ore descends to the battery floor, four feet helow, where it is thrown into the batteries, which contain 30 stamps of the heaviest kind ever used in the State. The pulp is taken to 16 large Varney pans, each of one ton capacity. The pans discharge into eight 8-foot settlers, and the settlers stand in the center of the pans, being very conveniently arranged; the car track runs from the battery to the pans, settlers and retort room.

The blacksmith shop is situated between the two mille, so as to be handy for working for either one. The dam for tailing pit is six feet high and 21 feet wide; the pit covers three acres of ground. The mill started up on the 5th inst. at 6 P. M., crnshing ore from the Lightner shaft of the Raymond & Ely mine; there are 500 tons of ore at the mill and plenty at the mine. Quicksilver, amounting to 14 tons, is on hand for use. The mill, as well as all the works of the company, is under the superintendence of Col. C. W. Lightner, general superintendent. Thomas McMasters, superintendent of mills; J. McDermott, engineer; F. E. Seargent, assayer, and a reliable set of men, are now doing splendid work at the new mill.

Useful Information.

A Word About the Moon.

Every one is familiar with tho singular phenomenon known as the "new moon carrying the old moon in her arms," when, iu addition to the slendor orescent, the whole diso ia more or less distinctly visihle a few days after the new moon ; the samo appearance, or "the old moon nursing the new," presents itself in like manner in the waning moon, when she rises a few honrs before the sun ; hut we fear there aro few who shako off dull sleep to see it. This is what is called the *lumiere cendree*, or ashlight of the moon. Its appearance usod to ho taken as an indication that the moon was phosphorescent, or possessed some light of her own, indopendent of that she receives from the sun. Now, however, it is satisfactorily provod to arise from the sunlight reflected from the earth upon the dark moon ; for it must ho romembered that the earth is to the moon what the moon is to tho oarth, a reflector of the sun's light ; and when it is new moon to the earth it is full earth to the moon, and *rice versa*, and thus tho opaque moon becomes illnminated hy earth-light—to use a torm analogous to moonlight ; hnt on ao counut of the great size of the earth compared to the moon, this light is 14 times as bright as our moonlight, and thus occasional hrillancy of this "reflection of a reflection" is accounted for.

Science Perfecting Swimming.

Fredric Barnett, of Paris, has invented and patented a very novel yet simple apparatus for swimmers. The invention conconsists in snpplying to man by art the apparatus which has been given to the frog by nature. For the hands he has a large membranous fin which ie held to its place hy loops passing over the fingers and a strap around the wrist. The snrface prcsented to tho water hy these fins is so large as to add greatly to the effectivenese of the strokes of the arm, hut not so large as to exhaust the muscular power. Their effect is to very much reduce the effort required to swim without them. But the greatest ingenuity is displayed in the form and fitness of the fins for the legs, which are attached to the ankles, and are so formed that they act upon the water, hoth in the movement of hringing the legs together and throwing them hack. They act eo finely in treading water, as swimmors call it, that one can really walk, if not on the water, at least in it. The difference hetween swimming with this apparatus and without it, is very much like the difference between rowing a boat with a handle and the hlade of an oar. The old swimmer has no trouble in using the fins at first trial, and is surprised to find with what strength he can swim without exhaustion. He easily swims twice as fast with the apparatus as without it, and he can eustain himself for hours upon the water, or swim miles with it.

A Simple Alarm Clock.—Take a common weight clock and have a emall hole in each of the boarde that eupport the worke inside, in any convenient place near the hammer. Having attached a small wire or string to the wire that makes the olock strike in regulating, pass it through the holes and nnder the time weight, through another hole in the case to the outside, where, having secured it, you have an alarm clock that was never intended as snch. The time weight in descending will press on the etring and make the hammer strike until the whole weight runs down. To set the alarm the time weight must be gaged in winding, as it descende abont one-half inch in three-quartere of an hour. This is a hoy'e invention. It will wake a person without frightening him, which eome other alarms will not do.—*Scientific American.*

Keeping Fish Fresh with Suoar.—A method adopted in Portugal for preserving fish consists in removing the viscera and sprinkling eugar over the interior, keeping the fish in a horizontal poeition, so that the sugar may penetrate as much as possible. It is said that fish prepared in this way can be kept completely fresh for a long time, the savor heing as perfect as if recently caught. Salmon thus treated hefore salting and smoking possess a much more agreeable taste; a tablespoonful of sugar being eufficient for a five-pound fish.

How many of our lady readers ever dreamed that we send to Great Britain annually, fifteen million dollars in gold for the single article of spool cotton?

Good Health.

Medicinal Properties of Petroleum.

In nearly every drug store is found a celebrated remedy recommended hy English physicians, originating in Asia and pretended to be mannfactured in England, known as British or Rock Oil, which is proscribed as a liuiment for rheumatism, neuralgia, etc., which is nothing more or less than pnre petroleum and, it is no douht often nsed with very henefioial effect.

As a further example of the uses of petroleum for sanitary purposes, wo may cite the following very interesting and valuahle facts: Dr. Gelcich, dnring the recent epidomie rage of small-pox in Los Angeles, had many patients afflicted with that disease, and moreover had to officiate as County Coroner, in performing tho duties of which he was often called upon to enter houses and have bodies removed for burial. In fumigating snch places he found the most effective way was to place two or three onnces of the oil in a frying-pan, set it on fire and put it in the middle of the rooms. As a precantionary measure for himself he washed his hands in petroleum when it hecame nccessary to handle the hodies; he also recommended to every family to place a small quantity in a saucer in the corner of every room, which neutralized the miasma, purified the atmosphere and effectually prevented the spread of the infection. He believes that to this method is to he attrihuted the success that attended his practice during the eleven months eontinnance of that terrible epidemio.

Antiseptic Properties of Petroteum.

The antiseptic properties of petroleum are well described hy Dr. J. W. Twoler, Professor of Chemistry, etc., in Hobart College and Geneva Medical College, in his analysis of it made eome time since. He firet deecribee what putrefaction ie and etates, "that it is the decomposition, decay or natural destrnction of dead or organic matter. That whioh promotee putrefaction is air, moisture, warmth, oryptogamic plants and infusory insects. Dead organie snhstance, deprived of air and moisture and kept in a vacuum, resists putrefaction for au indefinite time. Chemicals may act in varions ways in checking and preventing putrefaction; they may in the first place exclnde air and moisture meohanically, as it were, like oils, resins, paints, tars, gums etc.

Now certain chemicals act in a two-fold manner—they may either abstract water from the organic matter and form new compounds, or they may extract the moisture hy the oxygen of the air. Such antiseptics are alcohol, common salt, saltpetre, etc. Othere again, act in a threefold manner; they abstract the water, exclnde the air and destroy animal and vegetable life.

The substance that will heet perform all thie work ie petrolenm. If for instance, a log of green wood be immersed in petroleum, the water and air in the pores of the wood are displaced hy the petroleum. Petroleum thus excludes air and moisture from organic snhstanees. It also destroys living vegetables and animals. Petrolenm containe no oxygen—which is a necessary element of decomposition. Out of all substances this hydrocarhon appears to he the most powerful antiseptic known; and I have no heeitation in recommending it for the purpose set forth."

As an Antidote for the Bites of Poisonous Insects, Reptites, Etc.

Petroleum is, also, a specific for the oure of the bite of venemous insecte, euch as hees, spidere, etc., and the hite of reptiles. A farmer in Illinoie had a large hee-gum near his house; one day some children playing near it annoyed the bees, which suddenly attacked the intruders and etung some of them in a terrible manner; the mother of the children immediately washed with petrolenm the parte etung and instant relief was ohtained. The same writer asserts that petroleum is an antidote for the hite of the rattlesnake and reptiles of kindred nature.

Offensive Breath.—For this purpose, almost the only snhstance that ehould he admitted at the toilette is the concentrated solution of chloride of soda. From six to ten drops of it in a wineglass full of pure spring water, taken immediately after the operations of the morning are completed. In some cases the oder arising from carious teeth is combined with that of the stomach. If the mouth be well rinsed with a teaspoonful of the solution of the chloride in a tumbler of water, the had odor of the teeth will be removed.

New Incorporations.

The following have filed certificates with the County Clerk, San Francisco.

Pacific Quicksilver M. Co.—Jan 31. Objects—To engage in and carry on the business of miuing and reducing quicksilver. Location of miue and works, San Luis Obispo county. Capital stock $5,000,000. Trustees: Chauncy B. Land, John C. Fall, A. E. Head, A. D. Allen and R. E. Brewster.

Pacific Borax Co.—Jan. 31. Object—To manufacture borax, salts and alkalies in Esmeralda county, Nevada. Capital stock $2,850,000, divided into 28,500 shares. Trustees: Justinian Caire, George W. Osborn, Michael Kane, Joseph Mosheimer and Henry N. Wyman.

Adams' Hill Cons. M. Co.—Feh. 2. Object—To mine in Eureka mining dist., Nevada. Capital stock $5,000, 000, into 50,000 shares. Trustees: J. B. Haggin, G. T. Lawton, H. A. Fox, O. F. Griffin and J. W. Gashwiler.

North Pacific Commercial Co.—Feh. 2d. Objects—To engage in business of fishing in the Pacific Ocean and in the inland waters of Washington Territory and British Columbia; to make oil, preserve fish and to transact a general commercial business. Capital stock, $100,-000, in 4,000 shares. Trustees: O. P. Sutton. Geo. Bragg and A. H. Todd.

San Jose Cons. M. Co.— Feb. 5. Object—To mine in Ely mining district. Capital stock $,3000,000, in 30,000 shares. Trustees: L. S. Robertson, Edmoud. L. Gould, C. D. Fitzhugh C. E.Hoffman and C. M. Thurman.

Starlight Gold and Silver M. Co filed a certificate of the increase of its capital stock to $2,500,000 shares.

Spring Mountain Co.—Feb. 8. Object—to mine in Ely District, Lincoln county, Nevada. Capital stock $2,000,000, with shares at the par value of $100. Trustees: C. H. Hallett, J. T. Pomeroy, A. G. Prince, G. E. Rogers and J. M. Buffington.

Leaming Petroleum Co.—Feh. 10. Object—To mine for petroleum, naphtha, asphaltum, and the oils thereof, and all other kinds of mineral and subterranean oils and snhstauces, in San Fernando District, Los Angeles county. Capital stock $1,000,000. Trustees: George W. Beaver, Joseph W. Stow, John Shirley, A. Georgiani and A. W. Von Schmidt.

Pea Vine Silver Mining Co.—Feb. 12. Object—To mine in the Ely Mining District. Capital stock, $3,000,000 in 30,000 shares. Trustees: J. B. E. Cavallier, C. P. Hall, C. N. Fox, Phillip S. Fay and G. Reiter.

Benjamin Gold and Silver M. Co.—Feb. 13. Object—To carry on the mining business in Arizona. Capital stock, $2,000,000, divided into 20,000 shares, at $100 each. Trustees: George D. Roberts, G. W. Curtis, James A. Andersou, J. W. Gashwiler, Samuel P. Middleton, George S. Kittridge, aud William Sears.

Inoomar Silver M. Co.—Feb. 13. Capital stock $4,000,000, with 40,000 shares at $100 each. Object—to carry on mining business in Ely District, Nevada. Trustees: J. D. Fry, F. C. Fassett, G. D. Roberts, George Reiter, and L. A. Booth.

Hoffman Silver M. Co. — Capital stock, $3,000,000, with 30,000 shares at $100 each, to carry on the silver mining business in Ely Mining District, Nevada. Trustees: J. D. Fry, J. W. Gashwiler, C. E. Hoffman, L. D. Fitzhugh and G. D. Roberts.

Orient Silver M. Co.—Capital stock, $1,-000,000, divided into 10,000 shares, valuation $100 each. Trustees: S. A. Raymond, James A. Pritchard, James Dods, Andrew Kohler, Wm. Hazelhurst.

Lyons and Wheeler Mining Co.—Capital stock, $5,000,000, divided into $50,000 shares of $100 valuation each. Trustees: Henry Lyons, I. Friedlander, A. C. Peachy, W. D. Wheeler and Frank Soulé.

Excelsior Gravel M. Co.—Object: To carry on gravel mining in Plumas county. Capital stock $500,000, with 20,000 shares of the par value of $25 each. Trustees: Warren R. Payne, Wm. H. Ladd, Ferdinand Vassault, John W. Bost and John Harding.

The following certificates of incorporation have been filed in the Secretary of State's office, Sacramento.

Calaveras Gravel Co.—Object—To operate in the Brushville district, Calaveras county; principal office, Stockton. Capital stock $200,-000. Trustees: Samuel Miller, Samuel Eldridge, John Bennett, Minord Thrasher and Edward Cannavan.

San Francisco Consolidated Mining Co.—Capital, $3,000,000; principal office, San Francicco.

Shannon Quartz M. Co.—Capital $80,000, principal place of business, Auburn.

Ella Mining Co.—Capital $120,000, principal place of business, Sacramento.

New Gold Fields.—The reports of gold discoveries on the north shore of Lake Superior are confirmed from various eources, though it appears probable that eome of the stories in relation to the richness of the deposits have been exaggerated—for instance, of gold-bearing quartz worth $6,000 per ton of Lake Shebandoweu, which is reached hy about forty-eight miles of travel over a splendid Government road from the shores of Lake Superior. Well defined veins of gold-hearing quartz, much of which is decomposed, have been found and traced for several miles. These veins contain, in addition to free gold, galena, very pnre silver glance, and iron pyrites. The sand in the streams of this region has heen found to contain gold, but whether in paying quantities has not yet heen ascertained. The silver mining in the region of Thnnder Bay continues immensely productive. At Silver Islet the quantity of silver daily dug ont is ouly limited by the force the operators are ahle to employ, and the supply appears to he inexhaustihle. Other mines in that region are yielding finely. The lands in which silver or gold have heen found extend back from the lako from fifty to one hundred miles One man has purchased 40,000 acres from the Canadian Government at one dollar au acre. The total population in the neighborhood of the mines is ahout 800; hut in the spring there will doubtless he an immense rush of fortune-seekers to these remarkable gold and silver fields. Tho country is wild and hroken, with hut little timber or soil capahle of cultivation.

Alvarado Foundry.

The Alvarado Foundry, says the Alameda County *Advocate*, is located on the Alameda Creek, at a point called Union City, about half a mile helow the town of Alvarado. The site was selected for its shipping facilities, the landing being an excellent one and the creek, to this point, navigable for steamers and schooners, while the Central Pacific Railroad is within easy reaching distance on the land side.

The proprietors of the establishment are Messrs. Tay, Brooks & Backus of 614, 616 and 618 Battery street, San Francisco, gentlemen of ample means and much experience in their line. They are very sanguine of the complete success of their enterprise; all the buildings and machinery are therefore of the most permanent and substantial kind. The two main buildings are 76x101 feet each; one of them, which ie used for a pattern shop and for mounting and fitting np stovee and other articles manufactured, heing two and a half stories high. There is also a building 45x95 feet used as a boiler room, and to separate and clean the castinge in.

A numher of other smaller huildings on different parts of the Company'e grounds used for various purposes show that a very extensive bnsiness is intended. At the north end of the casting house there is a water tank at a hight of forty-eight feet, supported hy a very snbstantial frame, which holds 6,500 gallons, from which by meane of hose all the buildings can be flooded giving great facilities for extinguishing fire.

The capacity of the foundry is now ahout ten tons of castings per day, bnt, as we are informed, it will at early day be much increased. The molding floor is, however, now larger than any molding floor in San Francisco, and prohably larger than any other in the State. The engine is a beautiful one of thirty horse-power, the boiler heing efficient to supply this engine and at least another of equal power.

The work done here will be the casting and finishing for the market, of French Ranges, etoves, hollow ware, cauldrons, grates, fenders, and all articles usually termed "honsehold furnishing goods." Stoves of original and elegant patterne will be made a specialty, and a distinguishing feature of the foundry. Any kind of work can also he done there promptly to order, for the machinist, farmer and miner. Any piece of casting can be duplicated there in a very short time.

Under the directions of the proprietors, Mr. Cyrus Packard, carpenter and builder, "broke ground" on the 21st of Septemher, 1871, and on the 20th of Jannary, 1872, the firet cast or "heat" was made, under the supervision of J. J. McDonald, Master Molder. Since then eeveral heats have heen taken, and several shipments of castings made to the city store and elsewhere; one quite large order having gone to Mexico.

Capt. J. W. Bryan, a very affable gentleman, with a clear business head, is the Superintendent of the establishment, and business connected with it. He is at present intimately connected with the proprietors, and will in a short time become a co-proprietor. The Captain's hrother, Mr. Joseph Bryan, is the resident manager and representive of the proprietors.

We in common with the whole community here most heartily wish this enterprise great euccess.

The Ophir mills on the Mariposa Estate commenced running last week on rock from the Josophine and Linda mines.

Gold and Legal Tender Rates.

SAN FRANCISCO, Wednesday, February 21, 1872.—Legal Tenders buying 91; selling, 91½. Gold in New York to-day, 110⅛.

Table of Contents.

EDITORIALS.—Vapor of Mercury, page 113. Earnest Talk to Miners; California Manufactures, 115. Hints to California Engineers; California Academy of Sciences, 121; Commissioner Drummond's Circular, 123.

CORRESPONDENCE.—Our Auriferous Gravel; Humboldt Mining Region, 114; Wastage of Precious Metals, 120.

ILLUSTRATIONS.—Stebins' Hydraulic Elevator, 113; Travis & Wagner's Portable Mill; Man's Place in Nature, 121.

MECHANICAL PROGRESS.—Mechanical and Engineering Progress; Bridge Building; A Knot Tying Machine; Novel Method of Warming Railroad Cars, 115.

SCIENTIFIC PROGRESS.—Facts with Regard to Storms; A Volcano in Miniature; Hight and Velocity of Meteors; A New Experiment in Gas, 116.

USEFUL INFORMATION.—A Word About the Moon; Science Perfecting Swimming; A Simple Alarm Clock; Keeping Fish Fresh with Sugar, 119.

GOOD HEALTH.—Medicinal Properties of Petroleum; Offensive Breath, 119.

DOMESTIC ECONOMY. The Art of Folding Linen; To Make Gravy that will Keep Several Days; Sausage Seasoning, 123.

MISCELLANEOUS.—The Hunt & Douglas Process for the Extraction of Copper from its Ores; The Ponsard Furnace; The Raymond & Ely 30-Stamp Mill, 118; New Incorporations; Alvarado Foundry, 119; Review of J. S. Phillips's Mining Book in "London Mining Journal," 124.

TO INVENTORS.—A cheap machine or apparatus is wanted by which the juice of melons or other saccharine juices, can be concentrated to the condition of syrup or sugar, under common atmospheric pressure, at a heat of not to exceed 180° F. We don't want the expensive vacuum pan, in use in all refineries and sugar factories, but a reasonably cheap apparatus that any farmer can afford to buy. We say 180° because we wish to concentrate without danger of burning the syrup.

THE FIRST STEEL BOILERS.—We inadvertently stated, last week, that the steel boilers now in use at the Almaden Quicksilver mines were from the "San Francisco Boiler Works" of this city; when the fact is well known that they were built at the Vulcan Fonndry, and were the first steel boilers ever made on this coast.

PERPETUAL MOTION—The *Scientific American* has published a series of articles on perpetual motion, in which it has illustrated by a cut, "every principle tried since the search began." The object has been to show inventors the folly of pursuing the search further. There were thirty illustrations.

A NEW ALLOY FOR JEWELRY.—We hear from Germany of the invention of a new alloy for making imitation jewelry. It consists of copper, 58-86 parts, zinc, 39-24 parts, and lead, 1-90 parts. We cannot vouch for its success, but it is so simple that any of our readers can try it for himself.

A NEW INVENTION.—We are beginning to imitate and perhaps equal the Japanese, in the manufacture of useful domestic utensils from paper. An exchange says:—In Pearl street, New York, there is a mill which makes from paper, milk pans, cups, bread pans, wash bowls, etc., which is said to be superior to wood or metal. The paper after being pulped is pressed to shape, dried, enameled, and subjected to a heat that would destroy some utensils of the kind. The material is light and easily handled, and does not rust, shrink or easily break.

Earnest Talk to Miners.

[For the PRESS—BY OUR MINER—No. 3.]

THE MINING INTEREST.

The True Position of the Miner.

Having in previous articles called attention to the importance of the mining interest of the Pacific Coast; shown how the Federal and State Legislatures neglect this interest, and exposed the plans of landgrabbers to obtain control of the mineral lands—we propose in the present article to say a few words to the miners about themselves. "Naught extenuating nor setting down aught in malice."

Those who respect themselves, command respect from others, is a truism of just as much force among those who delve in the dark, damp drifts of the deepest mines, as it is among those "who wear purple and fine linen and fare sumptuously every day."

The miners of California should fill a more prominent position in the body politic than they at present occupy. Their numbers, the value of their products and the nature of their employment entitle them to such a position. The reason why they fail to reach it, is their disregard of their own interests. When they shall awake and understand the strength of organization and unity of action, the importance of their interest will obtain proper recognition. Then the term "honest miner," will no longer be one of derision implying an inferiority on the part of those who work the mines and produce wealth, as compared with those who by gambling in mining stocks, concentrate this wealth in few hands to react on its producers, by becoming an instrument for their oppression.

Tho world admires courage and perseverance. It especially honors the soldier, who, amid the mad, brutal turmoil of battle risks life or limb in the work of destruction; yet, what is such courage when compared with that of the patient miner, who daily and hourly runs far greater risks in the more commendable aud useful work of productions. What greater monuments of individual perseverance can be found on the wide world's surface, than is presented by the miles of tunnel cut through rock-ribbed mountains; shafts cut through the stubborn rock or treacherous sands, from the summits of the foothills, down, down below the level of the ocean, and the hundreds of miles of ditches and flumes which traverse almost every mountain and cañon from the snowy Sierras to the sea? These are the monuments erected by the miners of California to the memory of the thousands who have perished "unhonored and unsung" during the progress of the work of producing the thousand million dollars worth of gold which sets in motion the machinery of the world's commerce and manufactures, decorates beauty in the palaces of the great and provides necessaries and comforts for the lowly dwellers in the homes of the poor.

The world is too just and generous not to honor the sturdy class capable of producing snch grand results. The absence of recognition of the merits of the miners of California is due to their neglect of their own interests; a fact which we are endeavoring to impress on their minds. It affords us much pleasure to observe that our efforts in this direction are producing the desired results.

The miners of Grass Valley, the most important quartz mining district in the world, satisfied that the use of a certain description of blasting powder was injurious to their health, have held several meetings to decide on the best means to prevent the use of this deleterious substance. They have made no tumultous demonstrations, used no threats, and say they desire no "strike." Like sensible men who "knowing their rights dare to defend them," they propose to explain the cause of their complaint to the owners of the mines, and to respectfully, but firmly demand that the materials, which they think shortens their lives, shall not be used in the mines.

Public opinion—the soverign power in our Republic—will always be on the side of the working class which adopts this manner to obtain redress of a grievance.

The owners of the mines must prove that the complaints of the miners are unfounded, or discontinue the use of the objectionable material, or the responsibility of the consequences will rest on them. We sincerely hope that the miners concerned will avoid every act that may bring them into discredit. They may depend upon our hearty support so long as they only resort to lawful means to abate what they claim is a serious injury to their interest.

REMARKS.—We are happy to be able to inform "Our Miner" and also the miners of Grass Valley, that a California inventor, Dr. A. Blatchley of this city, has already come to the relief of blasters troubled with the obnoxious fumes from various kinds of powder, with a very simple invention, which is said to almost instantly and perfectly lay the noxious vapors. We think the manufacturers of such powder stand in their own light by not testing its efficacy, and if successful, purchase the right for the benefit of their consumers. The patent was procured through the SCIENTIFIC PRESS Patent Agency, and is described in our issue of August 5th, 1871.—[EDITORS.

Wastage of the Precious Metals—No. 2.

BY ALMARIN B. PAUL.

[Written for the PRESS.]

The following paragraphs from the numerous letters I have been in receipt of, speak for themselves. I extract under the heads of States and Territories.

California.

"I have a mine and mill, amalgamating pans, etc., roasting furnaces for sulphurets, and other necessary appliances for working by the chlorine process—assaying apparatus, etc., and know how to use them. Now what next would you say, that with all these things it would be strange not to know what I am about, for I know that I save an average of not over one half the gold."

"They returned me by sampled assays from my ore $80 per ton, and I cauot get more than $10 per ton by mill working."

"We have worked our ores in arastras and have failed, we cannot save only about 40 per cent., and we have no base metal to contend with—the trouble is the gold is so fine and what is coarse is coated with something so it will not adhere to the mercury, althongh to look at it, it appears very bright. I save about $20 a ton and can get about as good a show out of the tailings as out of the ledge before working and I have worked in quartz ten years."

"The first lot of ore went $18; the second, $6.25; sulphnret tailings assaying $60 per ton—we quit.

"We have on hand from 300 to 400 tons of chlorination tailing's which assay from $15 per ton upwards."

"The general principle that has caused you to experiment. That is the Wastage of the Precious Metals is acknowledged by every practical miner.

"Mr. J. told me he had ore valued at $30 by assay and could get but from $10 to $15 out of it. There is no proportion between assays and yields. The rock I sent you was returned to me at $30 valuo and all I could make it pay was $7."

Colorado.

The following from the *Herald*, Central City, Colorado, and G. W. Baker's pamphlet of same city, is quite to the point. Such declarations of facts are credible to the journal and author and a benefit to the whole people. "It is only necessary to realize the fact, then comes a remedy." In answer to what the *Register* is pleased to term the *Herald* proclamation, we received the following statement for publication. The owner's name, and that of the mill, will be furnished at this office if required, also full and complete documentary proof of the details herein stated. The ore taken to the mill was such as is usually milled from the lode in question, and was in amount 140 tons. The mill is the ordinary stamp mill of Gilpin county, battery amalgamation and amalgamated copperplates in good working order, and managed as is usual, in like milling establishments; the treatment by milling and the plates returned 80⅓ ounces, a little over 4 ounces per cord. The owner of the ore required blankets to be used after the plates, and in this way stopped 10½ tons tailings — very nearly 10 per cent. The blanketings were sampled, assayed and sold. The assayer valued their contents at 5 ounces in gold and 11 ounces in silver, per ton. After the blankets, the flow was again settled and roughly buddled, securing 45 tons of second tailings. These were sampled and assayed, yielding a value of 3 oz. in gold and 9 oz. in silver per ton. A little over 40 per cent. of the whole mass of ore was thus re-worked. Now for the figures, estimating gold at $20 per oz. and silver at $1.30 per oz.:

Yield by stamp mill, 80⅗ oz. @ $20	$1,610 00
Value of blanket tailings 13⅗ tons 5 oz. G.—67⅗ oz., at $20	1,350 00
13⅗ tons, 9 oz. S.—148⅗ oz. @ $1 30	193 00
45 tons tailings 3⅗ oz.—157⅗ @ $20	3,150 00
45 tons tailings, 9 oz. silver—405 @ $1 30	546 00
Total value of ore	$6,849 00
Average value per ton, nearly	$49 00
Saved by mill process	11 00
Loss by milling process	$37 25

NOT QUITE 24 PER CENT. of the valne of the ore was obtained by the milling process.

The blanketing and stoppage of the tailings was not a part of the milling process, so called, and if the owner of the ore had not attended to this himself, the milling would have brought him in debt. A part of the same ore was taken to another mill previously, where the owner did not supervise the running and save the tailings, all of which went their way down the stream. That lot brought the owner of the ore in debt to the mill man.

Again Mr. Baker says:

Assays of 45 samples of tailings went	$27.58
" " 23 " " blanket washings	$59.23
" " 38 " " dressed "	$42.00

So much for the assay of tailings; while the average per ton of 120,000 tons of ore as worked is estimated at eleven dollars and fifty cents per ton, seventy per cent. of the 120,000 tons went into tailings; hence, 84,000 tons of tailings. These being worth $20 per ton, (a concession of $7.86 from average assay,) we have $1,680,000 representing the loss by milling; an amount greater than the gross yield of bullion shipped, by $300,000. In other words, the methods used in Gilpin county treat ores worth $3,000,000 to obtain $1,378,000, and waste $1,500,000.

From the various methods of calculation we have taken, all undeeignedly reaching about the same result; from the great number of instances where a great waste can be proved by figures, the data given; from the constant repetition of the fact, that the mills do not get 50 per cent. of the metal; and the evil results of a bad system, or systems, are apparent to every one, and a subject of chronic complaint. Seeing this, it became a duty to arouse attention, and if possible, point out defects. In doing this, or after it is done, it is very naturally aeked, "well, what course ought to be adopted; what kind of machinery, or upon what system or programme shall we work our ores?"

Nevada.

My observations in these articles show the percentage of the better class of mills, still I have the following add:

"We have had repeated assays by experienced men with the following average results: Gold $54, silver $20—$74; and on account of fineness of gold cannot get to exceed $24 per ton."

"We have ores which contain from $60 to $90 in gold and $5 to $25 in silver, and get from 20 to 50 per cent."

"There is a great quantity of gold in some of these mines that cannot be saved by pan amalgamation."

(To be continued.)

A Hint to California Engineers.

EDS. PRESS:—From reading the article in the SCIENTIFIC PRESS of Jan. 17th, about the successful and increasing use of asbestos for packing, I am desirous of seeing its application to engines on this coast tested. The material is abundant in various parts of this coast, aud could probably be furnished in San Francisco cheaper than in any other large city in the world. Who will be the pioneer in preparing for use and giving it a thorough trial here, and report the same in your columns? Please insert this and oblige a friend of

PROGRESS.

Travis and Wagner's Portable Mill.

Onr illnstration represents a portablo mill in a convenient form, for grinding either qnartz or grain. There are two hurr stones, the upper ono of which is stationary and the lower ono arranged so that it may be raised or lowered by means of a convenient screw so as to meot the upper stono and grind eithsr coarse or fine. As the stones wear away the screw raises the lower one as far as required, and when its length will no longer admit, a set of screws are loosened abovo and the upper stone is lowered to meot the lower one. The stone is raised by a perpendicular lift by means of a lever attached to a screw.

It can bo regulated at will so as to admit of grinding quartz, gmin, spices, etc., fino or coarso. The solf-fceding apparatus is arranged so that every revolntion of the stono shakes the feeding shoo twice. The oil bush holds sufficient oil so that it will luhricate the shaft for throe months without renewal. Tho hopper may be rogulated to feed fast or slow as requirod.

Differont sizes of this mill are made and will he fonnd convenient either around a qnartz mill or npon a farm. Those intended for grinding quartz are made with vsry hard stones so as to ensnre durahility. The mills are manufactured hy Travis & Wagner, who may be addressed at No. 41 First street, in this City.

Travis and Wagner's Portabls Mill.

California Academy of Sciences.

The California Academy of Sciences held their regular meeting on the 19th inst., President Heuston in the chair. Oliver Eldridge, Mayor William Alvord, Samuel M. Wilson, F. W. Van Rsynegom, Ralph C. Harrison, George E. Page and A. T. Chamhers were slected to membership. Rudolph Gottgetrsn, Professor of the Polytschnic Institute, Munich, Bavaria, was elected a corresponding memhsr.

Questions for Discussion.

Dr. A. Kellogg of the Committee on Questions for Discussion suhmitted the following questions:

First—Do ærolities fall chiefly in the path of the ecliptic or magnetic path—that is, 22 degrees 30 minutes on either side of the poles of the earth, and what is their origin?

Second—Have the remains of tropical production in Arctic climes any bearing upon the geological phenomenon of the procession of the equinoxes.

Third—Is ths restless desire from age to age for more facts characteristic of those who are unable to reason from principles to causes, and would any amount of chaotic facts be sufficient for snch persons?

Dr. Gibbons proposed the following: Can the climate of California be altered sensibly by changes of the earth's surface, hy cultivation and otherwise?

On motion of Dr. Hewston the selection of a question was deferred until the next meeting.

Donations.

A number of donations to the cabinet were reccived, among them the first piece of cast steel manufactured on this coast and a mat or sack of a species of pepper-wort root from the Sandwich Islands. Dr. Stont presented two works on California by a German author and commented upon them, saying that the author greatly deprecates the wholesale destruction of our magnificent forests. Dr. Stout as one of the special committee on puhlications and transactions of foreign ssociations, suhmitted a report showing a list of the contrihntions received from them and noticing especially the valnahle geological maps of Sweden. A rssolutiou was passed to send in return the geological maps of this State.

State Aid.

A motion that a committee of three he appointed to draft a bill soliciting State aid to enable the Academy to erect a snitahle building, was referred to the Trustees. A resolution providing that the Trustees be required to forward a petition to the Legislature, praying for a continuation of the State Gsological Survey as at present constituted was carriod unanimously.

Man's Place in Nature.

The minds of many men are confused on this question. One reason for this is, the fact that they start out on wrong principles. They go on the snpposition that man is simply a developed animal, whereas, in fact, he is a crsated human being. "In the image of God created he him." These secular philosophers, such as Owen, Darwin, Huxley, and others, fail to comprehend this grand fact; nor do they seem to understand where to draw the line hetween man and animals—bstwesn instinct and reason. Phrenology explains this whole matter. Man has a three-fold nature, and, for the sake of illustration, we may say the hrain is like a three-story house. The lower story, including the cellar and kitchen, where the eatables and drinkahles are supposed to he stored, answers to the animal propensities and the instincts. Here are located the organs of appetite, the sight, hearing, taste, smell,—indeed, all the senses, including the domestic affections, the procreative principle, common to reptile, animal and man.

The second story of this house, or hrain, is occupied with a class of faculties not possessed hy the animal, and here is where the line may he drawn betwsen instinct and reason, man having both, while the animal has hut one. Here in this second story is reason, causalty, comparison, invention, with other powers not possessed hy animals, but constituting necessary and ever-present powers of man.

Now, let us move up one story higher. What do we find here? Furniture and appurtenances totally above the reach or comprehension of any animal. We have Benevolence, which no animal ever possessed: we have Conscientiousness, a sense of justice on which integrity is based, never manifested by any animal; we have the faculty of Hope, which gives man a sense of immortality; we have faith, which gives him a spiritual sense or a prophetic forecast of the higher life, of that which is beyond the reach even of reasou; we have Veneration, which gives devotion, and inclines man to acknowledge his obligation to obey the superior or creative Power, and render homage to his Makor, and he snbmissive to do his will. Man prays! The lower animals recognize no superior, except aftor a trial of strength. These traits make man a different being from any of the animal kingdom—tho cronwing work of creation.

Fig. I.

And this is "man's place in nature." Bstween man and animal there is a marked separation with no connecting links. Examine the heads, ovsn the naked skulls of reptile, beast, bird, and man, and the whole thing is as simple as it is absolute. Then why puzzlo over the question of man's descent, or, rather, asosnt, from plant to beast, and from beast to hnman? Why not take these basic principles of Anatomy Phrenology and Psychology, and settle the qusstion on these? It will oomo to this at last. The threc-fold nature of man we have often discussed, and now propose to illustrate it, viz., the animal or instinctive, the intellectual or rsasoning, and the moral or spiritual natures. In Fig. 1 these three ranges of powers are indicated. In region No. 1, helow the first line, the organs in the base of the brain are shown. Thoss are common to man and the lowsr animals. This rsgion takes in the perceptive intellect, the passions, propsnsities, and such of the social organs as belong to animal life. That region may be called the animal hrain, located in the lower story of the head. Rising one step to region No. 2, we have the great reasoning or intellectual field, which the animal does not share with man. In region No. 3 we have the moral and spiritnal, whioh is entirely wanting in all the animal kingdom. These occupy equal proportions in the well-halanced head. In Fig. 2 we exhihit the skull of a human being, with the three regions indicated by dotted lines and marked by numhers. The moral and spiritual region is not quite so well developed in the skull, Fig. 2, as in the head, Fig. 1, but it answers all the purposes of illustration.

Fig. II.

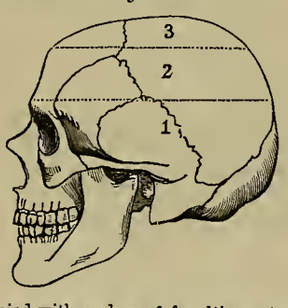

Fig. III.

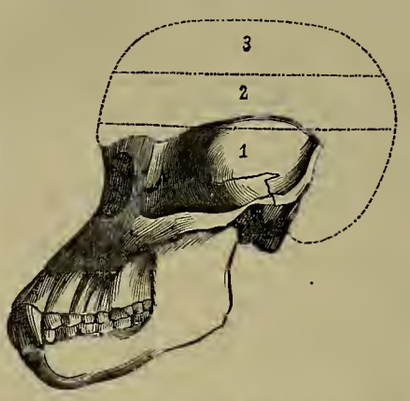

Fig. 3 is the gorilla's skull. Its shaded outline shows the immense jaws and face, and the small bulh constituting the cranium. The brain is not larger than that of an infant a week old. We draw the same three lines, showing the regions as we show them in the human head. Region No. 1, it will be seen, contains almost the entire hrain, showing that the gorilla has only the animal passions and instincts. We have drawn a dotted outline of a human head over the gorilla's, showing what the gorilla lacks in development upward. Although he is larger than man, bodily, he has a small hrain, and nearly all the brain he has is located in the animal or instinctive departmsnts. Region No. 2 is practically wanting. Region No. 3, as will he seen, is wholly wanting. If the head were developed according to the dotted outline, and the face were shortened off like that of a human being, and the prodigious jaws were more light and delicate, it would look like a human head, and with such a development would have the human faculties to guide, regulate, and control his immense physical force. But the gorilla is a heast, and only a beast, with a beast's hrain and face; and though the outline of the hody has some analogy to that of the human, the mental qualities which constitute human nature strictly speaking are, in him, entirely wanting. Those teeth are quite as savage and beastly as those of the bear, and the brain is shaped like that of a dog, with decidedly less of intelligence in the development of the brain, and far less of it in character. The advocates of the devclopmcnt theory make altogether too wide a leap from monkey to man. They pass many animals in that leap which in point of intelligence are quite in advance of the whole ape tribe.—*From the Annual for* 1871.

Notices of Recent Patents.

Among the patents recently ohtained throngh Dewey & Co.'s Scientifio Press American and Foreign Patent Agency, the following are worthy of mention:

New Material for Paper Stock.—S. D. Baldwin, Marysville, Cal. This patent claim is for the nse of *Scirpus Lacustris* (or common tnle) for the mannfacture of printing, wrapping and other gradss of paper. Mr. B. has for some considerahle time had experiments going on here and in the East, and has finally snceeded in estahlishing the fact that the native tnle, which grows so ahundant, in almost sndless tracts of cheap swamp lands in California, can be economically mannfactured into first-class papers. We sse no reason why it cannot be gathered, and with very little preparation pressed into bales for shipment to the priacipal papsr manufacturing conntries, there being supply sufficent for the world. Although no considerable quantity of paper has yet hssn made of this material, we have no douht of its valus, and hopo soon to learn of extensive arrangsmsnts hsing made at some convenient point in this State for prsparing the raw material for shipment abroad, and for nse at home. There seems to be no good reason why it shonld not stimulate a much neglectsd mannfacturing indnstry on this Coast, *i. e.*, paper making. We hope Mr. Baldwin will succeed in making this useful and abundant material more widely known and estahlish it as one of our State exports.

Raising Tailings.—Wilford A. Rogers, Folsom, Cal. This invention relates to a method for elevating tailings and dirt from placer diggings when the claim is situated lower than the surrounding ground, and it consists of a slightly declining slnice hox, into which the dirt is thrown and carried to the lower end hy a current of watsr. At this point the hox enters the lower end of another close hox which inclines sharply upward so that its outer end extends to the surface of the snrrounding ground. One or more nozzles enter this box at different points nsar the bottom and point in the dirsction of its outlet. A strong currsnt of water passes throngh these pipes and hy its momentum carries tailings up to the surface of the ground, the the action being similar to that of a Giffard injector.

A Photographing Invention.—The *Morning Call* mentions one of the important inventions for which patent claims have recently heen made through onr Scientifio Press agency, as follows:

"Mr. H. W. Vanghan, the well known photographer of this city, has just invsnted a little apparatus which, it strikes us, will be found espscially useful in taking the pictures of children, as it dispenses with the great black cloth with which the tube of the camera is covered, and the removal and replacement of which, while the picture is being taken, tends to impair the result, by distracting the attentention of the sitter. Instead of the cloth or brass cap which covers the tube of the camera, Mr. Vaughan employs a disk of brass or other metal, consisting of two ssmi-lunar portions, which open and close like the blades of a of pair scissors, and thus open or close the tube of the camera. They are worked noiselessly and instantaneously by the slight pressure of a little knob on the top of the instrument, and the plate is exposed and closed again without any manipulations that can be seen hy the sitter. By this means the operator waits until the child assumes a favorable expression, when he presses the spring, exposes the plate, and takes the picture without making any motion that attracts the attention or causes a motion of his sitter. Like all useful inventions, this is exceedingly simple, and may be attached to any photographic camera."

The Vulcan Iron Works.—We are pleased to learn that operations will be resumed at these works about the middle of next month, under a new and efficient organization, at which time the managers will he ready to receive and serve their old customers and friends.

Domestic Economy.

The Art of Folding Linen.

Though washing machines, wringers, and various new kinds of soaps have greatly lessened the labor of washing, nothing has yet come into general use which does away with the old-fashioned laborious system of ironing. There may be mangles and things of that sort, which lesson the labor, but they are not common. To be able to iron nicely is a great accomplishment, and every young lady should know something of it. The wheel of fortune is so constantly turning, that even the highest cannot tell how soon ehe may be glad of a little household skill in the matter. However neatly a garment may be ironed, the effect is spoiled if it is not also neatly folded. Teach the little girls this in their first attempts at ironing, and they will remember it all thcir lives. Let the hems of handkerchiefs, pillow cases, and the like, be brought together with mathematical nicety, and then the folds carefully pressed down.

The old town of Anjou was once most remarkable for its folding of linen. It seems a little thing to distiuguish a place, but one who had once witneesed a display of the grand old cabinets of its spacious mansions, would be likely to remember it ever afterwards.

It was a great pride of a housekeeper in such an establishment to throw open her great presses and reveal the curious contents. Here would be an immense sheet of heavy linen, shaped like a drinking trough. Around it would be four and twenty sheep fashioned from other linen articles, all with bowed heads as if drinking. At the head stood a tall shepherd folded from some other garment. Windmills, abbeys, towers and castles are very common, not to speak of the lesser articles as napkins and the like, which are folded into beautiful shapes of lilies roses and other flowers.—*Country Gentleman.*

To Make Gravy That Will Keep Several Days.—Lay in a stew-pan or suitable vessel half a ponnd of lean, juicy, fresh meat of the poorest pieces or trimmings; over this put half a pound of pickle pork, or a little less bacon of the side meat. Cut up two medium-sized onions and a few eprigs of parsley. Pour into the veesel a tumblerful of boiling water (not more than this;) cover the vessel, and let the meat stew, turning it once, until it is a rich brown color; then pour in boiling water enough, to jnst cover it; let it simmer an hour; remove the meat; thicken the gravy slightly with a paste made of brown flonr and water; let that simmer half an honr; add any essenee of ham or good gravy that may be saved for such purposes. Put in an earthen vessel well covered, and exclude from the air. Warm it before serving; season with any catsup liked. For making all brown gravies, fry the meat first, and pour over hot broth, gravy, or water; use the browned sugar or flour for coloring the thickening. Kidneys, livers, necks of poultry, the scraggy parts of the necks of animals, may be used for making the stock for gravy.—*Prairie Farmer.*

Sausage Seasoning.—"As hog-killing time" is now at hand perhaps the following directions for seasoning sausages, taken from a correepondent of the "*Rural New Yorker*, may not come amiss: Take fifty pounds of meat, pass it through a meat cutter, spread it out in any convenient vessel, then weigh out ten ounces of salt, four ounces of pepper, and five of sage, pulverized; sprinkle this over your meat and then mix it in a little; then pass it through your cutter, and all is right. Then put up as you choose; or, if you wish, you may use summer savory, or you may transpose the pepper and sage, acoording to quantity. I have used this formula twenty years, and wish no other. I suppose any novice will know that this preparation will answer for a greater or lesser quantity. If any one has a better recipe let them give it.

Bops.—One pint of milk, three eggs, one spoonful of bntter, four spoonfuls of flour, mix them well together and bake in plates, and in a quick oven. They ought to be buttered while hot, and put one above another, before sent in.

Stepping on Chairs.—Never step on a chair without first placing a newspaper on it. The tronble is slight and the eaving is great.

Syrup of Coffee.—This preparation is of great use to those who have long journeys to make. Take half a pound of the best gronnd coffee; put it into a saucepan, containing three pints of water, and boil it down to one pint. Cool the liquor, pnt it into another eaucepan, well scoured, and boil it again. As it boils, add white eugar enough to give it the consistency of syrup. Take it from the fire, and when it is cold put it into a bottle and seal. When traveling, if you wish for a cup of good coffee, you have only to put two teaspoonfuls of the syrup into an ordinary coffee-pot, and fill with boiling water. Add milk to taste, if you can get it.

Cooking Rabbits.—Many people admire rabbit roasted whole, except the head. This is best stuffed. While roasting bathe frequently with butter, dredge it with flour, and manage as with any other roast. The head and liver may be boiled. Split the head, take out the brains, mash them with the liver and add to the gravy. Wine aud jelly are liked by some people in the gravy. Keep the rabbit in weak salt and water at least twelve hours, if the weather will permit before cooking. We prefer rabbit stewed. It ie a daintier dish?

Mechanical Hints.

The Length of Sash-weights.—The following table, taken from *Leffel's Mechanical News*, will be found useful in the making of sash weights, which, of course, must balance accurately the weight of the sash. The first column of figures indicates the diameter of the round weight or the length of one side of the square weight, in inches and fractional parts of an inch. The other two columns are sufficiently explained in the head-lines. Windows of dwelling-houses and all classes of public buildings are now so generally made with box frames for the reception of weights and pulleys, that the manufacture of the weights is quite an important branch of industry. It is a very troublesome one in some cases, especially where a job of this kind is only occasionally called for, and the workman is obliged to make an intricate calculation for each new size of weight required.

Diameter.	Length of 1 lb. in inches.		Diameter.	Length of 1 lb. in inches.	
	Round iron.	Square iron.		Round iron.	Square iron.
⅛	19.67	16.38	2¾	.86	.68
⅜	12.63	9.83	2⅞	.78	.60
⅜	8.69	6.85	2⅞	.70	.55
⅞	6.41	6.02	2¾	.64	.50
1	4.44	3.84	2⅞	.69	.46
1⅛	3.87	3.03	3	.64	.42
1¼	3.13	2.46	3⅛	.60	.39.3
1⅜	2.58	2.03	3¼	.46	.36
1⅜	2.17	1.70	3⅜	.42	.33
1⅝	1.85	1.45	3⅜	.39	.31
1¾	1.59	1.25	3½	.37	.29
1⅞	1.39	1.09	3⅝	.34	.27
2	1.22	.96	3⅞	.32	.25
2⅛	1.08	.85	4	.30	.24
2¼	.96	.76			

To obtain the length of the weight, it ie only necessary to multiply the length of one pound in inches by the number of pounds which the weight is to balance.

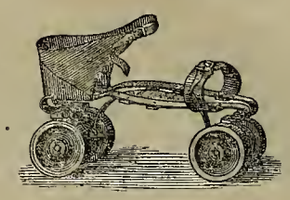
Stone Cement.—Hydrated silica combines much easier with bases than common quartz-sand, (anhydrous silica). On this Professor Boettger has based the employment of infusorial earth, a white pulverulent mass, which occurs in various localities in Europe and in this country, in large masses, as the binding ingredient of an excellent cement for stone-work. He mixes eqnal parts of infusorial earth and oxide of lead (litharge) with one-half the quantity of hydrate of calcia (freshly slacked lime) and linseed-oil varnish to a homogeneous thick paste, and obtains a mass of extraordinarily great binding power, which after eome time assumes the hardness of common sandstone. This cement is applicable in all cases where iron is to be fastened in stone, where artistic stone work, such as fountains, vases, statuary, etc., is to be mended; in short, where small quantities of the binding material are required. For the more common uses of the mason and stone-cutter, this cement is, of course too dear to permit of extended application.

Large Casting.—An immense anvil block, weighing some sixty tons was recently cast at the Washington Navy Yard. This is said to be the largest iron casting ever made in the United States.

Joy ie one of the greatest panaceas of life. No joy is more healthful or better calculatcd to prolong life than that which is to be found in domestic happiness in the company of good and cheerful men, and in contemplating with delight the beauties of nature.

The C-Spring Roller Skate.

PATENTED 1871.



Rights and Skates for Sale.

This superior Skate is now beginning to attract the attention of Rink Owners, it beiug the only Cramping Skate now before the public (except the Plympton Skate) that can run without infringing a former patent.

This Skate is Positively no Infringement

Of anybody's patent. It is made in the most substantial and workmanlike manner, and possesses the following points of merit: Beauty, Elasticity, Ease of Movement, Strength, Lightness, and does not injure the skating floor as much as the ordinary skate.

Every pair Warranted to be just what it is represented. Parties intending to

START A RINK,

Should examine and test this Skate. Sample pairs sent O. O. D. on application.

In ordering samples state the number of boot or shoe worn, and whether for lady or gentleman.

Varney's Patent Amalgamator.

These Machines Stand Unrivaled.

☞ For rapldity pulverizing and amalgamating ores, they have no equal. No effort has been, or will he spared, to have them constructed in the most perfect manner, and of the great number now in operation, not one haa ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan helng filled, the motion of the muller forces the pulp to the center, where it is drawn down through the apperture and hetween the grinding surfaces.—Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing a regular flow hetween the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Setlers made on the same principle excel all others They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill-men are invited to examine these pans and setlers for themselves, at the office, 229 Fremont Street, San Francisco.

BLAKE'S PATENT STEAM PUMPS.

WHAT IS SAID BY THOSE WHO USE THEM.

SALEM, Oregon, January 16th, 1872.

MESSRS. BERRY & PLACE, San Francisco—Gentlemen: In answer to your query regarding the working of the large Blake Steam Pump, our company purchased of you, we would say in all sincerity that the pump *has exceeded our expectation*. It has been in use since the 27th of September, 1871, and has thus far given the most perfect satisfaction. It does its work with ease, does not get out of order, and requires but little or no attention to run it. It is SIMPLE, DURABLE, and PERFECT in its construction. We have found it entirely satisfactory and just the pump *in every respect* needed for our work.
Yours, respectfully, W. F. BOOTHY, Pres't Salem Water Works.

PHŒNIX MINE, Napa County, January 16th, 1872.

MESSRS. BERRY & PLACE, San Francisco—Gentlemen: The No. 8, Blake Steam Pump we bought of you last fall is doing good service. We are having a large amount of water to contend with during this stormy weather; but the pump throws it all out of the main shaft (160 feet deep) with perfect ease, and is only working from 60 to 80 strokes a minute. It is a complete pump and no mistake. We are well satisfied with its working, and if you wish to use the name of our company, as a reference, you are at liberty to do so. Very resp'tly, GEO. FELLOWS, Supt. Phœnix Quicksilver M. Co.

OFFICE STARR MILLS, VALLEJO, Cal., January 13th, 1872.

MESSRS. BERRY & PLACE, San Francisco—Gentlemen: We are pleased to state that the No. 3 Blake Pump purchased of you, has constantly supplied our three boilers for the past year, with water heat to above boiling point with one of Armstrong's Patent Heaters. It has given us no trouble nor expense, and has in fact fully come up to your recommendations.
Yours, Etc., STARR BROS. & CAMPBELL.

OFFICE S. J. WOOLEN CO., SAN JOSE, January 29th, 1872.

MESSRS. BERRY & PLACE, San Francisco—Gentlemen: We have used a No. 6 Blake Steam Pump now for about two years, both as a Tank Pump and as a Fire Pump in case of need: and it has given excellent satisfaction. *It suits us in every respect.*
Very respect fully, R. F. PECKHAM, Pres't San Jose Woolen Co.

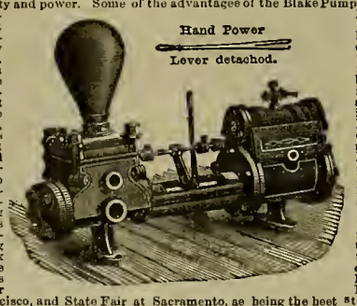
BELMONT, Cal., February 6th, 1872.

MESSRS. TREADWELL & CO.—Gentlemen: In reply to your inquiry concerning the large Blake Steam Pump, purchased of Berry & Place, by Mr. Ralston, I will say, that it gives ENTIRE *satisfaction*, even working as it now is, where no other Pump could; for it is *at present six feet under water*, yet it does its work PERFECTLY.
Yours, Etc., J. E. BUTLER, Supt. Water Works and Engineer at W. C. Ralston's.

BLAKE'S PATENT STEAM PUMP.

These Pumps have been tested, and found to be indisputably without an equal wherever tried. They have been sold in the Pacific States now for nearly three years, and we are willing every one in use may be referred to; every Pump will speak for itself. They are constructed in the most simple style, and built in the most thorough manner—especially calculated for simplicity, durability and power. Some of the advantages of the Blake Pump may be summed up as follows:

It is positive under any pressure. May be run slow or fast as may be desired. Will discharge more water than any others of the same dimensions. Has no leaky joints, the steam part being cast in one entire piece. The steam valve is perfectly balanced, is cushioned at each end, and slides with the greatest facility *having no cams, nor complex rotary arrangements to get out of order*. Will start at any point of the stroke, and will discharge all the water of condensation. The Pump has no crank or fly-wheel, thereby saving a considerable item of expense to the purchaser. Having *no dead points*, it therefore needs no watching, and is consequently ready to start without using a starting bar or any hand work whatever. The Blake Pump is extensively used on Railroads and Steamboats, in Hotels; for Mining and Fire purposes; in Breweries, Tanneries, Sugar Houses, Factories, Mills, Laundries, and as Boiler Feeders, wherever steam is employed. In fact, wherever water or other liquids are desired to be raised in large or small quantities, or against heavy or light pressure, it is the cheapest and best Pump that can be used. It is offered to the public as the most perfect independent steam Pump ever invented. Forty different sizes are made, capable of throwing from 1,000 to 200,000 gallons an hour, and adapted to any class of work that may be required. Every pump will be warranted to perform the work required of it by the purchaser, or it may be returned and the money will be cheerfully refunded. The Blake Pump was awarded a silver Medal at the last exhibition of Mechanics' Institute, San Francisco, and State Fair at Sacramento, as being the best Steam Pump on exhibition. The agents have recently imported several of the largest-sized Mining Pumps for water works, and deep mines, and will be pleased to refer parties to them; we claim for it, that it is the most simple and durable, and consequently the best Steam Pump ever built. For sale by TREADWELL & CO., Machinery Depot, old stand, corner of Market and Fremont streets, San Francisco, who will be pleased to send circulars to any address, or show its advantages to parties calling on them.



It has no Cams or Rotary Complex Valves. It has stood the test wherever tested.

IT IS SIMPLE, COMPACT, DURABLE, AND POWERFUL.

☞Manufactured by Geo. F. Blake & Co., Boston, who build and have on hand a larger variety of Steam Pumps than any other concern in the country, embracing *forty* different sizes, and capable of throwing from 1,000 to 200,000 gallons an hour, and adapted to every description of work required. ☞Send for circular and prices.

Commissioner Drummond's Circular.

The Order to Prevent Settlement in the Foothills.

The lstter of Instructions of Commissioner Drummond, issued Dec. 2, 1871, and to which ws hrisfly alluded at ths time, is attracting much attention, and is evidently calculated to work a great injury to the mining counties, from ths fact of its tendency to discourags further agricultural settlement in the foothills, and thus interfere with an important source of prosperity which was just heginning to he opeued up in those couuties under the previous instructions of Commissioner Wilson. The purport of this letter, which has heen called "An Order to Prsvent Settlement in the Foothills," is a formal withdrawal from disposal, under the agricultural land laws, of all the lands in 83 townships in the foothills of Tuolumne, Calaveras, Amador, El Dorado, Sacramento, Placer and Nsvada counties, which townships ars especially dssignated as follows:—

Township 1 north, ranges 12, 13 and 14 east. Township 2 north, ranges 11, 12, 13, 14 and 15 sast. Township 3 north, ranges 10, 11, 12 and 13 east. Township 4 north, ranges 10, 11, 12 and 13 east. Township 5 north, ranges 10, 11 and 12 east. Township 6 north, ranges 10, 11, 12 and 13 east. Township 7 north, ranges 9, 10, 11 and 12 east. Township 8 north, ranges 9, 10, 11 and 12 east. Township 9 north, ranges 9, 10, 11 and 12 east. Township 10 north, ranges 8, 9, 10, 11 and 12 east. Township 11 north, ranges 6, 7, 8, 9, 10 and 11 east. Township 12 north, ranges 6, 7, 8, 9, 10 and 11 east. Township 13 north, ranges 6, 7, 8, 9, 10 and 11 sast. Township 14 north, ranges 7, 8, 9, 10, and 11 east. Township 15 north, ranges 7, 8, 9, 10 and 11 east. Township 16 north, ranges 7, 8, 9, 10, 11, 12, 15, 16 and 17 east. Township 17 north, ranges 16 and 17 east. Township 18 north, ranges 16 and 17 east; and township 19 north, ranges 19 and 17 east—all Mount Diahlo hass and meridian.

Ths effect of this order is to reqnirs all people who havs settled or who may hereafter settls in ths foothills to apply to ths Land Office, advertise for thirty days, and have a trial, with witnesses, to provs that ths land thsy may claim is more valuahle for agricultural than for mining. If the decision is in favor of ths settler, the fact is mads known at Washington, and if no contestant appears within a year or two hs will hs allowed to "provs up" his claim and get his patent. The cost of hoth trials and advertising is thrown upon the settlsr, and will amount to douhle the Government price of ths land.

This order is rsvsrsing the rulings of Commissiouer Wilson, who held that all the land above descrihed was agricultural, and threw the cost of proving to ths contrary on the miner, who, of courss, is the only one who can hs expected to havs the proof—his "diggings" or quartz vein constitnting the fact of its mineral character. By this decision ths farmer is in fact called upon to provs a negative.

Ths reason for this reversal of Mr. Wilson's instructions ars stated hy Mr. Drummond as follows:—

This course has heen forced upon the Department hy several circumstances; among which may he cited ths fact that ths majority of applications for mining titles from California ars for lands marked "agricultural" upon the official township plats; that in making thess returns of surveys, largs areas in ths heretofors reservsd mineral belt are marked on ths plats as "agricultural land," whils upon ths sams plats, and within ths tracts so rsturned as agricultural, ars aunotations of "quartz ledges," "mining ditches," hydraulic mines," "diggings," etc., thc plat thus contradicting itself, and leaving this offics in ths dark as to the true quality of ths laud,

In a case now pending hefore this office, of an application for patent for a quicksilver mins—one which has heen worked for years—it was found that the land was returned as "agricultural," and, falling with the limits of thegrant, was patented to the Western Pacific Railroad Company before said application was received.

The Commissioner fears if the rulings of Mr. Wilson were continued the minsral lands would he indiscriminately ahsorbed hy speculators. But it is evident that the land office at Washington does not fully understand this question of mixed mineral and agricultural lands, and it is unfortunate for the people—our agricultural settlers in the foothills especially—that the power held hy the General Government over those lands, is exercised without a full knowledge of all the facts.

Under these circumstauces it is to he hoped that Mr. Sargent, our newly elected Senator, who fully understands all the facts in the case, aud that ths prosperity of our mining counties depends largsly on the encouragment of agriculturs withiu their foothill limits, will take this matter in hand, and, if possihls, secure hy Legislation, what it seems impossihle to effect hy official routins. Thsrs is really no difficulty in the mattsr, if our officials will only go honestly and intelligsntly to work. Ths nsw order sesms to havs no better argument in its favor than that ths Commission fonnd some difficulty—which is simply misapprehended—in carrying out ths old rulings, which, whils properly administered, gavs satisfaction to hoth the agriculturist and the miner, and were contrihuting largely to the development of an important but hitherto neglected portion of the puhlic lands, and the consequent prosperity of ths counties in which they were located.

Review of J. S. Phillips' Mining Book in the London Mining Journal.

Practical Mining Literalure.

The want of sound scientific kuowledge has been much felt by the miners employed in developing the vast mineral resources of the western regions of the United States, aud for this want the work of Mr. J. S. Phillips, M. E., of San Francisco, will prove an excellent remedy. The book is written expressively for the miners in the districts mentioned, and in addressing them Mr. Phillips remarks that the greatest mistakes in American mining have been caused by lack of ordinary prudence in a comparatively new aud most difficult business. * * *

It is not pretended even to give an outline of the various sciences connected with mining, nor to convert miners into scientific men; but Mr. Phillips seeks to give them sufficient knowledge to enable them to help themselves in however unsettled a part of Western America they may be mining in; he would teach them something of geology to enable them to recognise a "trne fissure vein" when they see it, or if they have not already been in the field, he would teach them how to explore and where to explore, with the best chances of snccess. A vein having been discovered, the next thing is to ascertain whether it is worth working; the author, therefore, gives a section on assaying and descrimination—that being, indeed, the leading feature in the volume. * * *

The work has now been extended to embrace the whole field of mining, which he considers sufficiently hazardous at the best having too many blanks for a prize to sustain unnecessary errors arising from insnfficient preliminary examination, as most deplorably evinced by retrospectiug the legion of mills that have been erected on hundreds of ledges, but as enormously expensive assaying machines to prove their worthlessness. * * *

Metallurgy, which is treated of in the conclnding section, and embraces descriptions of roasting, milling, chlorinising, smelting, and chemical reduction. is dealt with in the same practical manner as the other subjects the book altogether being one exactly calculated to suit the views and meet the requirements of those for whom it has been written. It is not intended as a scientific work, but to facilitate practical operations upon seienttfic principle. This object the book is well calculated to obtain and its value is much enhanced by the principle which Mr. Phillips has adopted of including only those processes which can easily be carried out by practical men unused to the delicate manipulation necessary in the laboratory of the practised chemist. The work will undonbtedly obtain a large number of readers.

Invention of Suspension Bridges by the Chinese, 1,900 Years Ago.

The most remarkable evidence of the mechanical science and skill of the Chinese at this early period, is to be found in their suspended bridges, the invention of which is assigned to the Han dynasty. According to the concurrent testimony of all their historical and geographical writers, Sangleang, the commander of the army under Kaou-tsoo, the first of the Hans, undertook and completed the formation of roads through the mountaneous province of Shense, to the west of the capitol. Hitherto its lofty hills and deep valleys had rendered a communication difficult and circuitous. With a body of 100,000 laborers he cut passages over the mountains, throwing the removal soil into valleys, and where this was not sufficient to raise the road to the required hight, he constructed bridges, which rested on pillars or abutments. In another place he conceived and accomplished the daring project of suspending a bridge from oue mountain to another across a deep chasm. These bridges, which are called by the Chinese writers, very appropriately, flying bridges, and represented to be numerous at the present day, are sometimes so high that they cannot be traversed without alarm. One still existing in Shense, stretches 400 feet from mountain to mountain, over a chasm 500 feet. Most of these flying bridges are so wide that four hersemen can ride on them abreast, and balustrades are placed on each side to protect travelers. It is by no means improbable (as M. Pauthier suggests) that, as the missionaries to China made known the fact more than a century and a half ago, that the Chinese had suspended bridges, and that many of them were made of iron, the hint may have been taken from thence for similar constructions by European engineers.

British Patents for Pacific Coast Inventions.

Followiug is a list of inventions patented or protscted hy Provisional Specifications in Englaud hy Invsntors in ths Pacific States and Territories, from July 29, 1870, to December 1, 1871.*

Mineral Wealth of Bolivia—The Mines of Potosi.

It is seldom that we hear any mention made of the mines of Bolivia, yet their extent is great and the late discoveries within her borders are likely to regenerate the country and make her name widely known. Messrs. Hunt & Douglas, discoverers of the renowned process for working copper ores, have taken the tronble of procuring the exclnsive right to use it in Bolivia; and the silver deposits of the country are much more extensive than many suppose. The Panama *Star and Herald* says on this subject:

Some how or other it is only very recently that Bolivia has been distinguished from Peru, particularly among Europeans in general. Not long ago, as we all know here, the people made a revolution, drove out Malgarejo, and now have a new Government; not only that, but a new era of prosperity, we trust, is about to be opened np to her. Bolivia, though at some distance from the coast and pushed back as it were toward the interior by Peru, is still an important country, both for extent of territory, richness of soil, and many of the most valued products of the three kingdoms of Natnre. Her plains and mountains are drained by the Amazon and Parana. The mines of Potosi, which gave to Peru the repntation of fabnlous riches, are sitnated within her borders. Potosi, which at the beginning of the seventeenth century had a population of 150,000 souls, has now ceased to be what it was. Another discovery has just been made, not in the fertile regions of that Republic, but in the sandy deserts of Atacama, bordering on the Pacific. We allude to the rich silver mines of Caracoles. New discoveries in the same region are being daily made, each one of which surpasses the other in richness of ore. The quantity of silver extracted from these mines has proved rich beyound anything yet known, eclipsing by far the most famous mines of ancient and modern Peru.

The otherwise sterile region in which these great discoveries have been made naturally presents many obstacles to the full working of these mines and development of the region, the principal of which is the difficulty of transit to the coast, a distance of 120 miles over ravines, mountains and desert, all of which renders the introduction of food, mining utensils, etc., and especially water for more than one thousand persons, very costly and difficult operations. The scarcity of water and other inconveniences of the locality have had the effect of preventing any great increase of population as well as the working of the mines, many of which are at a stand still until a railroad can be constructed for communication with the coast. We have reason to believe that these obstacles will only be temporary, as a line of rails will shortly be laid down from Mexillones to Caracoles. The Bay of Mexillones forms by far the most capable and safe natural harbor on the west coast.

Several limited companies have been formed to work some of the Caracoles mines, and for those yet remaining in the hands of the original owners, there is a keen competition, both by native and European houses. We shall, hereafter, from time to time take occasion to inform our readers of the further development of this miners' Paradise in Bolivia.

DELAYED.—Our monthly series for January were issued thie week.

THE VISALIA DELTA is one of the hest printed and well circulated interior journals puhlished in the rich agricultural and rapidly developing valley of Tulare. By E. M. Dewey, Visalia. lambp

Ripe and Luscious Melons the Year Round!

Seeds for Sale.—The Seeds of the famous TURKISH MUSKMELON (which keeps in palatable condition in winter and summer) are now offered for sale (for the first timpai in America) at this office. They are said to he excellent for preserves and sweet pickle, and superior to citrons or other melons. We have the sole wholesale and retail agency of the introducer, on this Continent, R. Marchella, of thie State. Small packages, by mail, 50 cts., prepaid to any part of the United States. It is a choice novelty. Send in season. The supply is not large.

The Evangel, Office, 414 Clay street, San Francisco. Terms, $4 per year, in advance. THE EVANGEL is the organ of the Baptist Denomination for the Pacific States and Territories. All efforts on the part of brethren and friends to extend its circulation will be gratefully appreciated. $3, for one year's subscription, will be received from new subscribers, strictly in advance. Address "Evangel, San Francisco, Cal." Sample copies furnished free. 4v3-lambptf

UNIVERSITY OF CALIFORNIA.—The Preparatory Department is under the charge of five Professors of the University, and six tntors.

Besides the studies of the public schools, Algebra, Geometry, Latin, Greek, German, French, Spanish and Book-Keeping are taught.

Terms: Board and tuition, 4 weeks, $30. Students received at any time. GEORGE TAIT, Oakland, Master Fifth Class. se9bptf

$5 TO $20 PER DAY AND NO RISK.—Do you want a situation as salesman at or near home to introduce our new 7-strand White Wire Clothes Lines, to last forever. Don't miss this chance. Sample Free. Address Hudson River Wire Works, 75 William street, N. Y., or 1 Dearborn street, Chicago, Ill. 23v1-12mbp

Our Printed Mail List.

Subscribers will notice that the figures found on the right of the pasted slips, represent the date to which they have paid. For instance, 21sp70 shows that our patron has paid his subscription up to the 21st of September, 1870; 4j72, that he has paid to the 4th of January, 1872; 4jl73, to the 4th of July, 1873. The inverted letters (j, s, etc.,) occasionally used are marks of reference, simply for the convenience of the publishers.

If errors in the names or accounts of subscribers occur at any time an early notice will secure their immediate correction. Please notify us if you are not properly credited within two weeks after paying.

☞ *Postmasters, please send corrections also.*

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

WM. F. SPENCER—California.
W. H. MURRAY—General Traveling Agent.
C. H. DWINELLE—Special Corresponding Agent.
I. N. HOAG—Sacramento, General Agent.
F. M. SHAW—San Diego.
L. P. MCCARTY—California.
A. C. KNOX, City Soliciting and Collecting Agent.

FOR 25 CENTS we will send, postpaid, four sample copies (recent numbers) of the PRESS. This, we believe, will induce many to subscribe who have not yet read our paper. It is a cheap and valuable favor to send a friend anywhere.

Mining Companies

Should advertise their Meetings, Assessments, and Sales, in the SCIENTIFIC PRESS. Rates more than one-half less than daily publications. Stockholders should take the hint and request their managers to truly economize by advertising in a MINING JOURNAL, where all notices may be seen by cheaply purchasing and examining a weekly. You will thus save money and uphold a journal which upholds your interests

Mechanics' Institute.—Entrance 27 Post street, (bet. Kearny and Montgomery), San Francisco.

The Library of Reference, the Library, Reading Room and Chess Room are open from 8 A.M. until 10 P.M. every day, (except Sundays and Legal Holidays).

The Society possesses a Library of 18,000 volumes—the most valuable technical and scientific library on the Coast, embracing the transactions of the leading Scientific Societies of the United States and Europe, (among which are the philosophical transactions of the Royal Society of Great Britain, complete), and the standard, scientific and technical works; and is in immediate receipt of all new standards publications.

The Reading Room is supplied with the current periodicals and newspapers of the day.

The Mechanics' Institute is open to all, and the Trustees will be pleased to have visitors and others inspect the Rooms.

Entrance Fee, $1.00. Quarterly Dues (in advance) $1.50. Life Membership, $50.

LADIES DESIRING TO PROCURE A FIRST-CLASS SEWING Machine against easy monthly installments may apply to No. 294 Bowery, 157 E. 26th, 477 9th Ave., New York Good work at high prices if desired. 21v1-12mbp

CONTINENTAL Life Insurance Co., 302 Montgomery street, corner of Pine.

PACIFIC RURAL PRESS
BY
DEWEY & Co.
PUBLISHERS SAN FRANCISCO
A FIRST CLASS
Agricultural Home Journal.

It is one of the Largest, best Illustrated and most Original and Enterprising Agricultural Journals in America, and has no rival on the we-tern side of the Continent. Its circulation is Rapidly Increasing, and it is Very Popular with its Patrons.

A NEW HUSBANDRY,

as it were, is required on the Pacific Coast, on account of its peculiar seasons, soil, climate and topography. The new discoveries, ideas, and useful hints evolved in its rapid progress, are to be observed with interest, and read, as reported in the PACIFIC RURAL, with profit by practical and progressive agriculturists everywhere. Sample copies of the PRESS, post paid, 10 cts. Subscription, $4 a year.

DEWEY & CO., Publishers,
No. 338 Montgomery St., San Francisco, Cal. Nov., 1871

Miners Using Powder

Containing Nitroglycerine, giving off deleterious odors, should read the description of the patented process for instantly dispelling the noxious gases; and for further information address Dr. A. Blatchley, patentee, at SCIENTIFIC PRESS Office, S. F. 8v24tf

$1,000 REWARD

For any case of Blind, Bleeding, Itching, or Ulcerated Piles that DR. BING'S PILE REMEDY fails to cure. It is prepared expressly to cure the Piles and nothing else, and has cured cases of over 20 years standing. Sold by all Druggists. Price, $1.00.

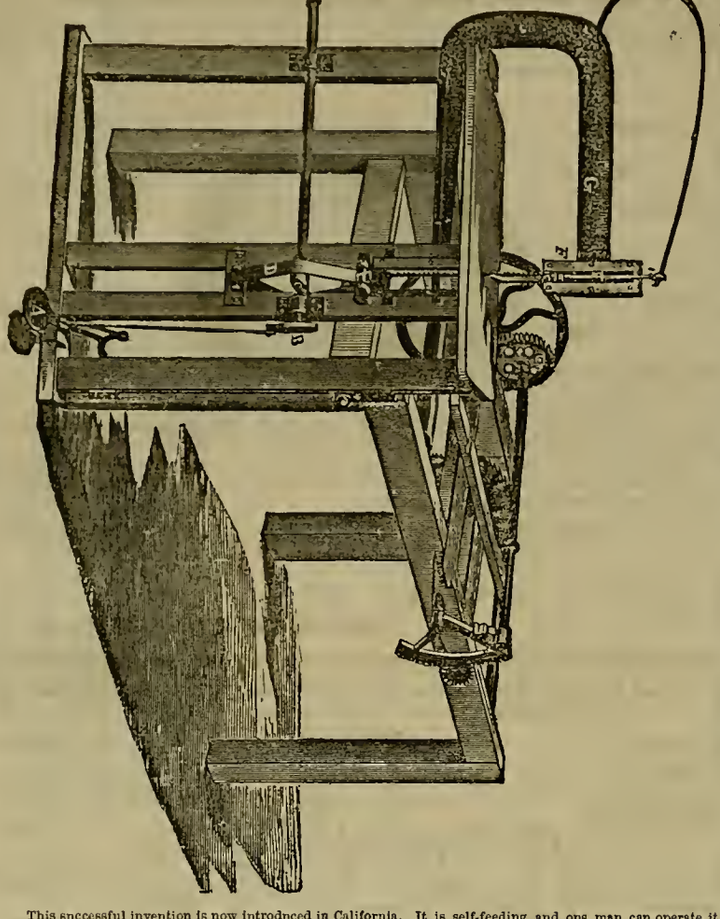
TALPEY'S PATENT
HAND SAWMILL AND JIG SAW
For Carpenters' and Woodworkers' Use.



This successful invention is now introduced in California. It is self-feeding, and one man can operate it easily, doing the work of several hands. Being a real convenience,

It is an Article of Economy

For every well regulated shop, where time and labor-saving is appreciated. Examine it in operation.

Price Low—$125 for both Jig and Circular Saws. W. I. TUSTIN, Agent,
23v2-1am-3m At whose shop, corner Market and Beale sts., it can be seen in operatio

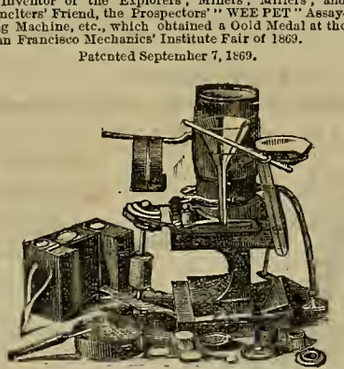
J. S. PHILLIPS, M. E.,

Examiner of Mines, Consulting Engineer, Mineral Assayer, Analyst, Etc., Etc.

Author of "The Explorers', Miners', and Metallurgists' Companion."

Inventor of the Explorers', Miners', Millers', and Smelters' Friend, the Prospectors' "WEE PET" Assaying Machine, etc., which obtained a Gold Medal at the San Francisco Mechanics' Institute Fair of 1869.

Patented September 7, 1869.



Arranged for the general purposes of the Analyst and Assayer.

Price, with instructions, tools and fluxes, $100.

Practical Instructions in all kinds of Assaying, Discrimination and Analysis.

24-v23-tf

To Parties About Building.

A person who is competent to prepare plans and take charge of the construction of Dwellings, Mills, Bridges, or other architectural improvements, will make favorable engagements with persons or corporations in the city or the interior. Has had full experience on this coast, and can insure a good satisfaction. Address EDW. W. TIFT,
5 -v24-sa No. 807 Howard street, San Francisco.

Mining and Other Companies.

Owing to the time necessary to mail the present large edition of the Scientific Press we are obliged to go to press on Thursday evening—which is the very latest hour we can receive advertisements.

Alhambra Hill Mining Company—Location

of works, Alhambra Hill, Pinto District, White Pine county, Nevada.

Notice—There are delinquent upon the following described stock, on account of Assessment (No. 1) levied on the Ninth day of December, 1871, the several amounts set opposite the names of the respectives shareholders as follows:

Names.	No of certificate.	No. shares.	Amount.
Andreas Fisher.....	not issued,	253	$126.50
R. Beverly Cole.....	" "	253	126.50

And in accordance with law and an order of the Board of Trustees, made on the 4th day of January, 1872, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, at the office of the Company, Room No. 22, Merchants' Exchange, California street, San Francisco, California, on Monday, the 26th day of February, 1872, at the hour of 1 o'clock P. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale. ALFRED K. DURBROW, Secretary.

Office: Room No. 22, Merchants' Exchange, California street, San Francisco, California. fe10-

Wm. Penn Consolidated Mining Company

—Location of works, Storey and Lyon Counties, State of Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the 26th day of January, 1872, the assessment of 50 cents per share levied on the 16th day of January, was rescinded, and an assessment of $1.00 per share was levied, payable immediately, in U. S. gold coin, to the Secretary, at the office of the company, No. 338 Montgomery street, San Francisco, California.

Any stock upon which said assessment shall remain unpaid on Thursday, the 29th day of February, 1872, shall be deemed delinquent, and be duly advertised for sale at public auction, and unless payment be made before, will be sold on Thursday, the 21st day of March, 1872, to pay the delinquent assessment thereon together with cost of advertising and expenses of sale. By order of the Board of Trustees.

feb3-4t HENRY TOOMY, Secretary.
Office, No. 338 Montgomery street, Rooms 3 and 4.

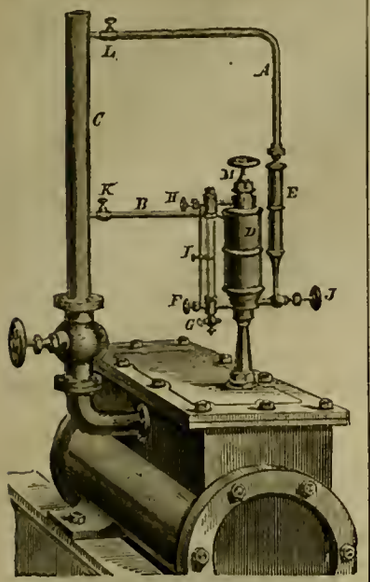
N. Seibert's Eureka Lubricators.



THE HIGHEST PREMIUM

Awarded by the Mechanics' Institute Fair, San Francisco, and State Fair, Sacramento, 1871.

These Lubricators are acknowledged by all engineers to be superior to any they have ever used; feed constantly by pressure of condensed water, supplied by pipe A, regulated under the oil by valve J, and forced out through check valve and pipe B into the steam pipe C; it then becomes greasy steam, passes to all the valves and cylinder at every stroke of the engine; glass tube I indicates amount used per hour. Packing on rods and stems lasts longer, and the rings on the piston will not corrode. One pint of oil will last from three to six days, according to speed and size of engine; I, sliding gauge; K, valve to shut off when engine stopps; H, F, valves to shut off in case of frost; steam does not enter the cup; it is always cool; warranted to give satisfaction. Patented February 14, 1871. Manufactured by California Brass Works, 125 First street, S. F. 24v23tf

AMBLER'S BLOWPIPE FURNACE,

For Roasting Rebellious Ores.

This new roasting furnace is the CHEAPEST AND BEST yet offered to the public. By furnishing an ample supply of oxygen to the ore while roasting, thorough oxydization of the sulphurets is secured at a small cost.

It is Adapted to All Kinds of Ores.

A description and illustration of this Furnace was given in the SCIENTIFIC PRESS of November 25th.

For terms, circular, and further information, address the agent of the inventor,

MONROE THOMSON,

At 444 California street, San Francisco, until further notice. 5v23-3m

DEWEY & CO.,

American and Foreign Patent Agents, Publishers of the Scientific Press, San Francisco.

PATENTS obtained promptly; Caveats filed expeditiously; Patent reissues taken out; Assignments made and recorded in legal form; Copies of Patents and Assignments procured; Examinations of Patents made here and at Washington; Examinations made of Assignments recorded in Washington; Examinatione ordered and reported by Telegraph; Rejected cases taken up and Patents obtained; Interferences Prosecuted; Opinions rendered regarding the validity of Patents and Assignments; every legitimate branch of Patent Agency Businese promptly and thoroughly conducted.

Our intimate knowledge of the various inventions of this coast, and long practice in patent business, enable us to abundantly satisfy our patrons; and our success and business are constantly increasing.

The shrewdest and most experienced Inventors are found among our most steadfast friends and patrons, who fully appreciate our advantages in bringing valuable inventions to the notice of the public through the columne of our widely circulated, first-clase journals—thereby facilitating their introduction, eale and popularity.

Foreign Patents.

In addition to American Patents, we eecure, with the assistance of co-operative agents, claims in all foreign countries which grant Patente, including Great Britain, France, Belgium, Prussia, Austria, Victoria, Peru, Russia, Spain, British India, Saxony, British Columbia, Canada, Norway, Sweden, Mexico, Victoria, Brazil, Bavaria, Holland, Denmark, Italy, Portugal, Cuba, Roman States, Wurtemberg, New Zealand, New South Wales, Queensland, Tasmania, Brazil, New Grenada, Chile, Argentine Republic, AND EVERY COUNTRY IN THE WORLD where Patente are obtainable.

No models are required in European countries, hut the drawinge and specificatione should be prepared with thoronghnese, by ahle pereons who are familiar with the requirements and changes of foreign patent laws—agente who are reliahle and permanently established.

Our schedule pricee for obtaining foreign patents, in all cases, will alwaye be as low, and in eome instances lower, than those of any other responsible agency.

We *can and do* get foreign patente for inventors in the Pacific State from two to eix months (according to the location of the country sooner than any other agents.

Home Counsel.

Our long experience in obtaining patents for Inventors on this Coast has familiarized us with the character of most of the inventione already patented; hence we are frequently able to eave our patrons the coet of a fruitless application by pointing them to the same thing already covered by a patent. We are always free to advise applicants of any knowledge we have of previous applicatione which will interfere with their obtaining a patent.

We invite the acquaintance of all parties connected with inventions and patent right business, believing that the mutual conference of legitimate business and professional men is mntual gain. Partiee in donht in regard to their rights as assigneee of patents, or purchasers of patented articles, can often receive advice of importance to them from a ehort call at our office.

Remittances of money, made hy individual inventors to the Government, sometimes miscarry, and it has repeatedly happened that applicants have not only lost their money, but their inventions aleo, from thie cause and conseqnent dolay. We hold oureelvee reeponsible for all fees entrusted to our agency.

The principal portion of the patent husinese of this coast has been done, and is still heing done, through onr agency. We are familiar with, and have full records, of all former cases, and can more directly judge of the value and patentability of inventions discovered here than any other agents.

Situated so remote from the seat of government, delaye are even more dangerous to the inventore of the Pacific Coast than to applicants in the Eastern States. Valuable patents may be lost by the extra time consnmed in transmitting specifications from Eastern agencies back to this coast for the eignature of the inventor.

Confidential.

We take great pains to preserve eecrecy in all confidential matters, and applicants for patents can rest assured that their communicatione and business tranеactions will be held strictly confidential by ne. Circulars free.

Engravings.

We have snperior artists in our own office, and all facilities for producing fine and satisfactory illnetrations of inventions and machinery, for newspaper, book, circular and other printed illustrations, and are alwaye ready to assist patrons in hringing their valuable die-coveriee into practical and profitable nse.

The Scientific Press,

Estahlished in 1860, is now the Largest, Most Original, Beet Illustrated and most Ahly and Carefully Edited Practical Mining Journal on the Western Continent. Its contents are made up of freeh intelligence in a condensed and interesting etyle, easily appropriated by the reader, who finds its columns replete with new facts and ideas not ohtainahle in the hooks of the past or in any one other of the journals of the day.

Varied in its carefully compiled and conveniently arranged departments, representing the epecial and leading indnstriee of the Pacific States—Mining, Mechanism, Manufacturing, Building, Improvemente and Inventions—it becomes a weekly informant to all Scientific, Mechanical, Mannfacturing and Industrial Progressionists on the coast, an immense list of whom teetify to its pleaeant, profitahle and elevating influence.

The progress of our journal has been steady and unvarying. Encouraged hy a liheral class of readere who exhibit their appreciation in a substantial way, we ehall, with our increasing facilities, experience and information, make each coming issne superior to its predeceeor.

Let every friend of Science and Indnstry on this eide of the continent take pride, not only in enstaining, hnt accelerating the advancement of a faithful representative of its highest interests by euhscribing for it and nrging its patronage hy others—now, without delay.

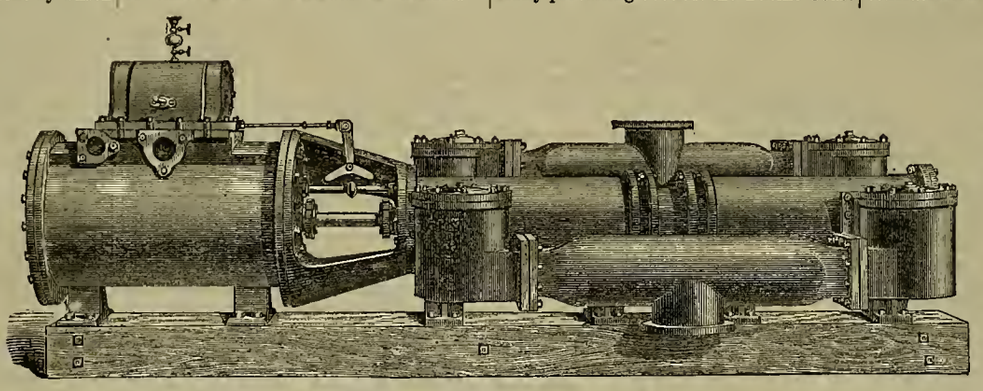
VOLUME XXIV. Number 9.

Selden's Double-Acting Plunger Pump.

By Our New York Editor.

Our readers will remember that a short timo since we gavo a description of the Soldon direct acting-stoam pump, illnstrated by sections, otc. We give below a cut of a Selden pump modified to snit the requirements of mining work. The steam end is the same as that described on page 81 of Vol. XXIII of tho Scientific Press. At tho right, tho pump is seen, consisting of two pump-barrels, with one long plunger, common to both, and secured to tho steam-piston with a steel rod, having, as nsnal, glands to pack that part of the plunger working throngh the barrel. The suction-pipo, which is common to both barrols, is seen bsneath the pump, and tho discharge pipe is scen above.

There is one important difference between this pump and those of the ordinary pattern, namely, an arrangement by which the steam and water pistons may be brought very near each other. Immediatcly abeve the piston-rod will be seen a smaller rod, on which is a projection or ronnded disk termed the "dog." This npper rod projects into the steam-cylinder, and also into the pump-cylinder, moving freely in and out of botb; of course, in itself it is motionless. The steam-piston on nearing the forward end of its stroke, strikes against the end of the rod which is in the cylinder, pushing it outward. The dog then impinges against the rocker immediately above it, communicating motion to the valve-rod, and so moving the slide-valve for the return stroke. As the latter reaches its end, the pnmp-plunger in its turn strikes against the end of the rod in the pump cylinder; the rocker is again moved, and the slide valves placed in position for the forward stroke.



SELDEN'S DOUBLE-ACTING PLUNGER PUMP.

It will be seen at once that the movement of the vslves is unaffected by the length of the stroke. And besides that, as long as the rocker, which is only ten inches from point to point, has space enough to work, it matters not how close the cylinders (pump and steam) be placed together. In fact, this distance need not be more than twenty-two inches for any length of stroke. Another point of advantage in this is the facility with which the motion can he reversed; a mere pressure of the finger on the end of the rocker being sufficient to alter its position, and so change that of the valves.

The dimensions of one of these pumps, recently manufactured by Mr. A. Carr, of No. 43 Cortland street, New York, are as follows: Length, 14 feet 6 inches. Diameter of steam cylinder, 24 inches. Diameter of water cylinder, 13¼ inches. Diameter of plunger, 12 inches; stroke, 36 inches; suction and discharge-pipes, 10 inches. Weight, 7¼ tons. It will be noticed from these data that the diameter of the plunger is one inch and a half less than that of the cylinders in which it works. In the ordinary piston pump, the foreign matter ruhbing and grinding hetween the interior of the cylinder and tho pisten, necessarily woars out the parts with which it comes in contact, and eventually causes them to rapidly deteriorate.

By using the plunger packod by a double gland in the centre, two poiuts are gained. The first is that the wear of sand and dirt upon the interior of the cylinder is prevented, the plunger not touching the cylinder by ¾ of an inch. The second point, of no less value, is that a simple stnffing box, accessible from the outside, takes the place of the troublesome packing of a piston, which is always hard to get at and invariably necessitates the stopping of work for a considerable length of time when a renewal is desired.
